"I like representatives of every race," he answered, as if not noticing her. "There are interesting specimens in all. I number among my acquaintances several Chinamen, a Moor, a Mexican, Jews, Portuguese and Russians innumerable. If that fellow was not in

your employ I would engage him to-morrow, merely as a study."

Miss Fern took the hand he held out to her and set the next meeting for Saturday evening. Then she said:

"If you want Hannibal, perhaps papa would oblige you. I certainly would do all I could to persuade him."

CHAPTER VI.

"HOW THE WOMEN STARE!"

The next day Archie Weil lunched with Lawrence Gouger. He wanted to talk with his friend about the young author and authoress. Gouger listened with interest to the story he had to relate, and nodded approval when it appeared that Archie had behaved admirably thus far in relation to Miss Millicent.

"Do you know anything about Mr. Fern?" he asked, when the other had reached a period.

"Nothing."

"Well, neither did I, a week ago, but I have taken pains to inform myself. He is a highly respectable elderly party, who deals in wool. He married a very beautiful lady, who has now been dead eight or ten years and he lives altogether in the society of his two daughters. If you succeed in getting Millicent's book on the counters you will earn his everlasting gratitude. They say he is not literary enough himself to be a judge of its merits, and if she has fifty copies to present to the family friends it will probably be all he will ask."

Mr. Weil uttered a low whistle.

"I don't know what the family friends will say of it," he replied, "but I call it pretty warm stuff. If the list includes many prudes they will hardly thank the girl for sending such a firebrand into their houses."

"Pshaw!" said Gouger. "The world is getting used to that sort of thing, and they won't mind it a bit. Besides, they will be so lost in admiration of their cousin's name on the cover that they will think of nothing else. What did you make out of her? Is she as innocent as I predicted?"

Archie poured out a glass of Bass' ale and sipped it slowly.

"Quite," he said, as he put it down on the table. "And she's no dunce, either." He went on to tell of the trap he had fallen into. "I'm dying with impatience to get her and Roseleaf together. They'd make an idealic couple."

Mr. Gouger inquired what he was waiting for.

"Oh, I want to do the thing right," said Weil. "I want to learn her as thoroughly as I can, before I bring him upon the stage. It will take three or four evenings more to hear the rest of her novel, and another to discuss it. I shall get around to him in about a fortnight, at the rate things are going. He will keep. What do you suppose he is doing now? Writing poetry! He sent a piece a few days ago to the _Century_, and they accepted it."

"He will be gray when it appears," said the critic. "It takes a long time for anything to see the light in that publication."

"But in this case an exception will be made," said Weil. "They have assured him that it will come out in their very next issue. He will be so proud to see his name in print that I expect to find difficulty in holding him back. A poet who appears in the Century has certainly stepped a little higher on the ladder."

The critic agreed to this, and remarked that such a man as Roseleaf should give his whole attention to poetry.

"Wait!" cried Archie. "Give him time. See him after he has fallen head over ears in love with charming Millicent Fern. There is something in him, I feel sure, and between that dear girl and myself we will bring it out. By-the-way, there is a character I want you to meet," he added, as Mr. Walker Boggs came into the room. "You have never had the pleasure, I think, though you have heard me speak of him."

Mr. Boggs had his attention attracted by a waiter who was sent for the purpose and came with great willingness to occupy a seat with Mr. Weil and his friend.

"We were talking of a New York merchant just now," said Archie, when the introductions were over, "and it occurs to me that you, who know almost everybody, may have some knowledge of him. He is in the wool business, I hear, and I think you once told me you had done something in that way. His name is Wilton Fern, and he lives at Midlands."

"Do I know anything about him?" echoed Mr. Boggs. "I should say so. He was my partner for seven years, and I still have a little stake left in the concern, on which I am drawing interest."

Mr. Weil showed his astonishment at this statement. What a very small world it was, after all! Then, after pledging his friend not to mention that he had ever discussed the matter with him, he went guardedly into the particulars of Miss Millicent's book, and of his having called at the house for the purpose of passing judgment upon it.

"I didn't know that was in your line," replied Boggs.

"Well, it was this way," answered Archie. "Mr. Gouger's decision didn't exactly suit the young lady, as it was not very favorable. Mine will be quite to her taste, as I view her abilities in a more favorable light. Now tell us all about the family, as the only one of them I have met is Miss Millicent. Why, this is a regular find, old man! You should have told me a week ago that you possessed all this information that I have been aching to get hold of."

Thus adjured, Mr. Boggs entered upon his story. From which it appeared that he knew the Ferns, root and branch, and had dined with them dozens of times.

"What sort of a chap is the pater?" asked Weil.

"A very well-kept man of nearly seventy, with a great deal of what is called 'breeding' in his manner, and a face like the portrait of a French marquis cut out of a seventeenth century frame. He doesn't look like a business man at all, and between ourselves he's not much of a one. All the money he ever made--saving my apparent egotism--was when I was in the concern. I've heard he's got a big mortgage on his residence and is going down hill generally. Too bad; nice fellow; sorry for him; such is life."

Archie asked if Boggs would do him a personal and particular favor, if it would not cause him much trouble; and on being answered in the affirmative, said he would esteem it a great honor if he could be introduced to Mr. Fern by that gentleman's former business associate.

"I suppose I shall run across him at Midlands, some evening," he said, "and get one of those presentations that are the most aggravating things in the world. I don't want that to happen, and the best way, to use an elegant phrase, is to take the bull by the horns, or in this case, the sheep by the tail. Will you make an accidental call on him to-morrow afternoon and let me be of the party?"

Mr. Boggs responded that he would be delighted. And this matter being settled, all parties could give more direct attention to their lunch than they had been doing for the preceding ten minutes.

"You must have heard of my friend Boggs, in the days when he was a figure on the streets of this town," said Weil, presently, returning to what he knew was the favorite subject of that personage. "You've lived here for twenty years, and of course the name of Walker Boggs is familiar to you."

Mr. Gouger looked a good counterfeit of complete mystification for some seconds, and then a gleam as of sudden recollection shot across his face.

"Certainly, certainly!" he said. "Mr. Boggs was what is popularly known as a lady killer, if I am not mistaken. You got married, did you not, Mr. Boggs, some ten or eleven years ago?"

The party addressed acknowledged the practical correctness of the date.

"Why, it comes back as plain as day," said the critic. "The _Herald_ had a page about you, including your portrait and some verses by a well known poet. It said your marriage had cast a gloom over Manhattan Island and some of the up-river counties."

Mr. Boggs gloomily nodded, to show that the statement was true. Then he touched his most rotund portion with a significant look.

"I'm a widower now," he said, "and nothing but this--_this_--stands in my way. As Shakespeare says, 'Tis not as deep as a well, nor as wide as a church door, but--' The ladies never look at me now, and all on account of this d--d flesh, which hangs like a millstone

around my neck."

Cutt & Slashem's critic, ignoring the peculiar character of the metaphor used, remarked politely that he thought no lady of sense would put great stress on such an insignificant matter.

"Insignificant!" echoed Boggs. "I'll bet it's fifty inches around, come! And it's not the 'ladies of sense' I'm after. Quite the contrary."

One of Archie Weil's explosive laughs followed this statement, which caused an expression of mild injury to settle over the countenance of Mr. Boggs.

"You're getting on toward forty, and you ought to quit," said Weil. "Confound the women! Let them go."

"That's well enough to talk about," replied Boggs, gruffly. "How would you like to follow your own advice?"

Weil uttered an exclamation.

"I? I have precious little to do with them, I assure you. For a man of my correct habits I have the worst name of any one I know. Everybody insinuates things about me, and they can prove nothing."

"We'll ask Isaac Leveson about that," sneered Boggs. "By-the-way, that wouldn't be a bad place to take young Roseleaf to, when you get to instructing him in earnest. I met the young fellow on the avenue last night and walked around with him for a couple of hours. He's a darling!"

"Roseleaf?" cried both the other gentlemen, in one breath.

"To be sure. How the women stared at him! I couldn't blame them; his waist isn't over thirty, and he's as handsome as--as I was at his age. I told him he could have all the loveliness in New York at his feet, if he liked."

Weil smiled significantly at Gouger.

"What did he reply to that?" he asked.

"Oh, he had an ideal in his head, and none of those we saw quite came up to it; for I did get him to raise his eyes and look at the prettiest ones. I drew out of him slowly that he would have nothing to do with a girl unless she had red hair; that--"

Mr. Weil uttered a laugh so hearty that it attracted the attention of everybody in the room. Mr. Boggs paused to inquire the cause of this outbreak, but Archie assured him that something entirely out of the present discussion had just occurred to him, which was to blame for his impoliteness.

"A girl must have _Titian_ hair," repeated Mr. Boggs, accepting the explanation, "or he would not consider her. He ruled out all the striking blondes and brunettes, saying that he liked only those of a medium shade. We came across one that answered these descriptions, an exquisite little creature who looked as if she would swallow him could she get the chance. And then there came out another idea. He would not think of this fairy because she was so short. 'I want a woman five feet, four inches tall,' he said, as if the article could be made to order, in case the size did not happen to be in stock. Then, would you believe it, he found a girl embracing every attribute he had mentioned. Her hair was just the right shade, her height must have hit the mark exactly, her complexion was medium. But no. She was too heavy. She would weigh a hundred and forty-five, he said, quite twenty pounds too much. If we had found a girl that filled all his description he would have invented something new to bar her out of the race."

Mr. Weil remarked that he was not so sure of Roseleaf's insincerity. He believed the right woman would yet be discovered, and that a case of the most intense affection would then spontaneously develop.

"In fact," he added, "I have the identical creature in mind. It is clear to us--to myself and Mr. Gouger here--that Shirley will never write a thrilling romance till he has fallen wildly, passionately in love."

Mr. Boggs smiled slightly, and then sobered again.

"Shall you have him marry, also?" he inquired, pointedly.

"Why not?"

"Because it will finish him; that's why. The romance in a modern marriage lasts six weeks. At the end of that time he will be useless for literary purposes, or anything else."

Mr. Weil shook his head in opposition to this rash statement.

"My theory is," said he, "that a novelist should know everything. To write of love he should have been in love; to tell of marriage he should have had a wife--a real one, no mere imitation; to talk of fatherhood intelligently he should become a father. How can he know his subjects otherwise?"

The stout man smiled significantly.

"And if he wishes to write of murder, he must kill some one. And if he wants to depict the sensations of a robber he must take a pistol and ask people to stand, on the highway."

"Now you are becoming absurd," said Archie.

"No more than you," said Boggs. "You go too far, and you will find it out. Let your novelist fall in love. That will do him good. But don't let him marry, or you will lose him, mark my word. Let him contemplate matrimony at a distance. Let him reflect on the glory of seeing his children about his knees. So far, so good. But when you have shelved him with a wife of the present era, when you have kept him up nights for a month with a baby that screams--his literary capacity will be gone. Make no mistake!"

Mr. Weil, half convinced, and much surprised to hear such wisdom from this unexpected source, made an effort to maintain his ground.

"Nearly all the modern novelists _are_ married," he remarked.

"Yes, and nice stuff they write, don't they? Namby-pamby, silly-billy stories, misleading in every line! They are the most unsafe pilots on the shores of human life. They start, without exception, from false premises. Their chart is wrong, their compass unreliable, their reckoning ridiculous from beginning to end. Where did you ever see a bit of real life that resembled these abortions? Do lovers usually fall on their knees when they propose? Is the modern girl an idiot, knowing less of the facts of nature than an oyster? Is the conversation between men and women filled exclusively with twaddle? You would think so, from reading these books; and why? They are written by married people, most of them, people who don't dare step over the line of the commonplace any more than a woman would dare order her dressmaker to put pockets in her gown!"

Archie looked at Mr. Gouger, who nodded a partial approval of these statements. Mr. Boggs betook himself with more interest to his chops. And the other two gentlemen, remarking that time pressed, bade him good-by for the day.

"I see you agree with him that I shouldn't marry Roseleaf?" said Archie, with a rising inflection.

"There is certainly point in what he says," replied Mr. Gouger.

"But--confound it! With the boy's disposition, it will be a delicate business," retorted Weil. "I don't know as I can carry him to the point of passionate love for pretty Miss Fern, and then shut off the steam when it suits me."

This matter was discussed for the next ten minutes, as the friends walked along toward the office of Cutt & Slashem.

"I think you are foolish to delay so long introducing him to her," said Gouger, finally. "I don't see that you are making any progress whatever."

"Ah, but I am," replied Weil. "I am making both of them more and more anxious for the meeting. Shirley walks the street feverishly impatient, and I have no doubt mutters her name in his dreams. Millicent talks about her ideal of manly beauty. When they get together failure will be impossible."

Mr. Gouger laughed at the idea that Roseleaf was "feverishly impatient" to meet any girl, and ventured to predict that the young man would have to be put in irons to get him to the residence of the Ferns when the time came; or at least to keep him there.

"Just the point I am working on," replied Weil. "Under ordinary circumstances I would have to handcuff his wrists to mine, but I am making such a strong impression on his imagination that he is crazy to go. And once she gets him under her influence--I tell you, Lawrence, she is no ordinary girl."

"She certainly does not write like one," smiled the critic, "either in her subject or her English. You may make something of him--I rather think you will--but not of her. Her ideas are wild, and her realism a little too pronounced even for the present age."

"She has truth on her side, you admit," said Archie.

"Yes, to a remarkable degree."

"Well, that ought to be something, if Boggs' estimate of the modern liar is correct. Shirley will help her to style, give her his own, if necessary. I am going to land both of these fish, if only to spite you, Lawrence. You tossed them away with that fine contempt of yours, and you will weep hot tears for it before you die."

At the door of Cutt & Slashem's they met the two members of that firm, who paused to say a word to Mr. Gouger. They were anxious for a new book to bring out as soon as possible, and were regretting with him that nothing worth publishing seemed to present itself.

"You may strain matters, it necessary," said Mr. Cutt. "We can't keep up on reprints forever. I hope you made no mistake in rejecting that book of Mrs. Hotbox. I hear it is selling well."

Mr. Gouger's face was, as ever, immovable before his employers.

"What 'Fire and Brimstone?'" he inquired. "The authorities seized the entire edition this morning."

Mr. Cutt looked at Mr. Slashem, with a startled expression.

"In that case, I am glad we escaped it," he said. "We shouldn't like that sort of an affair, of course."

Mr. Weil, who knew both the gentlemen well, inquired what they thought of Mrs. Hotbox's production.

"I have never seen it," said Mr. Slashem.

"Nor I," said Mr. Cutt.

The partners disappeared into the counting-room, where they had an interview with a binder who had offered to do their work at one-tenth of a cent a hundred copies less than the concern with which they were then dealing. Archie said good-by to Gouger, and went off to find Roseleaf, with whom he had engaged to take, later in the day, a ride through the Park.

"How soon am I to see your paragon?" sighed the young man, as they were making the grand round of that famous drive.

"Within a week, I hope. Are you getting uneasy?"

"I am getting lonesome," was the gloomy reply. "And I want to begin work."

"Well, it will soon pass now. To-morrow evening I am to hear another installment of her novel. Two more sittings after that will finish it, I should say. And the next thing will be--you. But have you seen no one else in all this time that you care for?"

The young man looked aimlessly at the fleecy clouds that hung low on the horizon.

"No," he answered.

"And you think you are ready for a passionate affection, if the right person is found?"

"I will try," he said, simply.

Mr. Weil roused himself and touched his horse with the whip.

"Try!" he echoed. "You will not have to try. She will carry you off your feet, at the first go. Shirley, I have found you a superb woman, that you _must_ love. All I want to feel sure of is, that you can control yourself enough to behave in a reasonable manner."

Roseleaf looked up inquiringly.

"She belongs to an eminently respectable family," explained Archie. "Her father is a gentleman of the most honorable type. She has a young sister, who--"

Roseleaf, slow at all times, had at last begun to comprehend.

"You surely don't think--" he began.

"Ah, that is the question! A novelist must learn so very much--a novelist who is to depict the truth, as you are to do. Where should he stop? What experience should he refuse, provided it may be utilized in his work? A responsibility that is no light one will rest on me, my dear boy, when I have introduced you to this family, and left you to your own devices."

Roseleaf's eyes opened wider at these mysterious suggestions, but he did not like to make any more inquiries. Weil changed the conversation, calling attention to the women they met, who turned their handsome heads to look at the young man, as their equipages almost touched his.

"What an awfully wide swath you are cutting!" was Archie's exclamation, as the throng increased.

CHAPTER VII.

A DINNER AT MIDLANDS.

True to his appointment Walker Boggs met Mr. Weil on the following afternoon, and set out with him for Wilton Fern's office. Though engaged, as has been already stated, in the wool trade, Mr. Fern did not have on the premises to which these worthies repaired a very large assortment of that product. His warehouses were in another part of the city, and all the wool that was visible to his customers was arranged in sample lots that would easily have gone into a barrel. Mr. Weil, notwithstanding the description that Boggs had given of his ex-partner, was not prepared to see such an exceedingly fine specimen of humanity as the one introduced to him. The word "gentleman" was written in large characters on his broad forehead and in every word he spoke. It certainly was not often, said Archie to himself, that one encountered that sort of man in business.

"I have already heard something of you, sir," said Mr. Fern, affably, but with the dignity that was a part of his nature, no more to be discarded than his eyes. "That is, if you are the same gentleman that has kindly offered to assist my daughter in arranging a story she has written."

Mr. Weil admitted the correctness of the supposition, but disclaimed any special credit for what he had done. He explained briefly how he was drawn into the case. The visit lasted upwards of an hour, during which the conversation wandered from literature to business and politics, and all sorts of things.

Mr. Weil could not tell from Mr. Fern's manner of alluding to his daughter's work whether he had a very high idea of its value or not. Indeed, there was very little to be learned from this grave gentleman that was not expressed in the language he used. He was inclined, Archie thought, to reticence, for when there was a lull in the conversation it was always one of the others who had to start it going. The thing that might be counted a substantial gain, out of the whole affair, was an invitation to dinner for the following Wednesday, in which Mr. Roseleaf was included, and Mr. Boggs also.

Before the Wednesday set for the formal dinner at the Ferns', Mr. Weil had heard the whole of Miss Millicent's novel read by the lips of that charming young woman. There was certainly something very strong in it, in spite of its grammatical faults. It would be a very good story when "Dr." Roseleaf had put it into a little better English.

The meeting between Roseleaf and Millicent was most interesting to the one who had been the means of bringing them together. The girl put out her hand with a straightforward motion of welcome, and it was accepted with something resembling timidity by the young man, who did not even raise his eyes to hers. The talk that followed was nearly all her own, Shirley's part in it being largely monosyllabic replies to her statements and suggestions.

When Miss Daisy was presented to both the gentlemen, for the first time--Mr. Boggs she remembered very well--she drew their attention for a few moments from her sister, but soon relapsed into the more insignificant place which she seemed to prefer. She was not as large in any way, as Millicent, and did not seem likely to become so. Her hair was of a soft shade of light brown, and her eyes a decided blue. In the presence of her sister she did not expect to shine, and was evidently relieved when she could go into a corner and talk over times long past with Walker Boggs.

Mr. Fern came in rather late, but still before the hour announced for dinner. He had his habitual look of quiet elegance, but withal an expression of care about his face, that Weil attributed to the business troubles of which Boggs had spoken. The manner of the

daughters toward him was marked by the watchful eyes of the chief conspirator. Millicent merely looked up and said, "Papa, this is Mr. Roseleaf, of whom we have spoken," and then when the greetings that followed were exchanged, went on talking with those about her as if there had been no interruption. Daisy, on the other hand, crept softly to her father's side, and putting an arm around his neck, kissed him when she thought no one observed her.

"You are tired, papa," she whispered.

"No, no!" he said, brightening. "I am very well."

It was at the table that Mr. Fern had his first conversation with Roseleaf, and the two men got along nicely together. Shirley acquitted himself creditably. Weil, who saw everything, noticed that the negro, Hannibal, in superintending the service in the dining-room, lingered more about Miss Daisy's chair than any other, and took extra pains to see that her wants were anticipated. In spite of this, however, Mr. Fern frequently asked his younger daughter to have more of certain dishes, as if his mind was constantly turned in that direction.

"How long do you think it will require to do the work you have so generously undertaken?" asked Mr. Fern of Roseleaf, when the dessert was reached.

"It is impossible to say," stammered the young man. "Some weeks, at least."

"So I supposed," said Mr. Fern. "That being the case I wish to tender you the hospitality of my home. It would be a great deal of trouble for you to come every day from the city, and I know we could make you comfortable here."

Roseleaf was about to decline the offer with thanks, when Mr. Weil spoke to him in a low tone.

"Take it, by all means," he said. "It's a chance in a lifetime. You know nothing of family life. Don't dream of refusing."

The delay allowed Miss Millicent to add her request to that of her father, and fearing to let his protege answer, Mr. Weil boldly spoke for him.

"It is a good idea," he said. "He will have his baggage brought up to-morrow. There's nothing like being on the ground, when there's work to be done. And, with the general permission, I am going to run out pretty often myself, to see how things progress."

The bright, off-hand way of the last speaker seemed to please Mr. Fern, for he heartily seconded this suggestion. When the table was vacated, Mr. Fern asked if he might be excused for a few minutes, while he wrote a couple of important letters, and requested Walker Boggs to show the guests through the grounds, where they could smoke their cigars till he returned.

Accordingly Weil and Roseleaf accompanied their new guide out of doors and across an extensive lawn to an arbor at the further end, where a handsome prospect of the Hudson unfolded itself. As Archie was wishing for some feasible way of getting rid of Boggs, temporarily, that gentleman espied an acquaintance in the adjacent road and went off to speak to him.

"Are you in love yet, you dog?" asked Archie, as soon as he and his young friend were alone. "What! You're not! Don't let an hour pass, then, before you are. The best of all proverbs is, 'Never put off till to-morrow what you can do to-day.'"

"How can I do this to-day?" was the doleful response.

"How can you help it, you mean? There she was at the table--Titian hair,The Project Gutenberg eBook of Narrative of the Life of Frederick Douglass, an American Slave

Bibliography of Sources

SOJOURNER TRUTH, THE LIBYAN SIBYL by Harriet Beecher Stowe

Many years ago, the few readers of radical Abolitionist papers must often have seen the singular name of Sojourner Truth, announced as a frequent speaker at Anti-Slavery meetings, and as travelling on a sort of self-appointed agency through the country. I had myself often remarked the name, but never met the individual. On one occasion, when our house was filled with company, several eminent clergymen being our guests, notice was brought up to me that Sojourner Truth was below, and requested an interview. Knowing nothing of her but her singular name, I went down, prepared to make the interview short, as the pressure of many other engagements demanded.

When I went into the room, a tall, spare form arose to meet me. She was evidently a full-blooded African, and though now aged and worn with many hardships, still gave the impression of a physical development which in early youth must have been as fine a specimen of the torrid zone as Cumberworth's celebrated statuette of the Negro Woman at the Fountain. Indeed, she so strongly reminded me of that figure, that, when I recall the events of her life, as she narrated them to me, I imagine her as a living, breathing impersonation of that work of art.

I do not recollect ever to have been conversant with any one who had more of that silent and subtle power which we call personal presence than this woman. In the modern Spiritualistic phraseology, she would be described as having a strong sphere. Her tall form, as she rose up before me, is still vivid to my mind. She was dressed in some stout, grayish stuff, neat and clean, though dusty from travel. On her head, she wore a bright Madras handkerchief, arranged as a turban, after the manner of her race. She seemed perfectly self-possessed and at her ease,--in fact, there was almost an unconscious superiority, not unmixed with a solemn twinkle of humor, in the odd, composed manner in which she looked down on me. Her whole air had at times a gloomy sort of drollery which impressed one strangely.

"So this is YOU," she said.

"Yes," I answered.

"Well, honey, de Lord bless ye! I jes' thought I'd like to come an' have a look at ye. You's heerd o' me, I reckon?" she added.

"Yes, I think I have. You go about lecturing, do you not?"

"Yes, honey, that's what I do. The Lord has made me a sign unto this nation, an' I go round a'testifyin', an' showin' on 'em their sins agin my people."

So saying, she took a seat, and, stooping over and crossing her arms on her knees, she looked down on the floor, and appeared to fall into a sort of reverie. Her great gloomy eyes and her dark face seemed to work with some undercurrent of feeling; she sighed deeply, and occasionally broke out,--

"O Lord! O Lord! Oh, the tears, an' the groans, an' the moans! O Lord!"

I should have said that she was accompanied by a little grandson of ten years,--the fattest, jolliest woolly-headed little specimen of Africa that one can imagine. He was grinning and showing his glistening white teeth in a state of perpetual merriment, and at this moment broke out into an audible giggle, which disturbed the reverie into which his relative was falling.

She looked at him with an indulgent sadness, and then at me.

"Laws, Ma'am, HE don't know nothin' about it--HE don't. Why, I've seen them poor critters, beat an' 'bused an' hunted, brought in all torn,--ears hangin' all in rags, where the dogs been a'bitin' of 'em!"

This set off our little African Puck into another giggle, in which he seemed perfectly convulsed.

She surveyed him soberly, without the slightest irritation.

"Well, you may bless the Lord you CAN laugh; but I tell you, 't wa'n't no laughin' matter."

By this time I thought her manner so original that it might be worth while to call down my friends; and she seemed perfectly well pleased with the idea. An audience was what she wanted,--it mattered not whether high or low, learned or ignorant. She had things to say, and was ready to say them at all times, and to any one.

I called down Dr. Beecher, Professor Allen, and two or three other clergymen, who, together with my husband and family, made a roomful. No princess could have received a drawing-room with more composed dignity than Sojourner her audience. She stood among them, calm and erect, as one of her own native palm-trees waving alone in the desert. I presented one after another to her, and at last said,--

"Sojourner, this is Dr. Beecher. He is a very celebrated preacher."

"IS he?" she said, offering her hand in a condescending manner, and looking down on his white head. "Ye dear lamb, I'm glad to see ye! De Lord bless ye! I loves preachers. I'm a kind o' preacher myself."

"You are?" said Dr. Beecher. "Do you preach from the Bible?"

"No, honey, can't preach from de Bible,--can't read a letter."

"Why, Sojourner, what do you preach from, then?"

Her answer was given with a solemn power of voice, peculiar to herself, that hushed every one in the room.

"When I preaches, I has jest one text to preach from, an' I always preaches from this one. MY text is, 'WHEN I FOUND JESUS.'"

"Well, you couldn't have a better one," said one of the ministers.

She paid no attention to him, but stood and seemed swelling with her own thoughts, and then began this narration:--

"Well, now, I'll jest have to go back, an' tell ye all about it. Ye see, we was all brought over from Africa, father an' mother an' I, an' a lot more of us; an' we was sold up an' down, an' hither an' yon; an' I can 'member, when I was a little thing, not bigger than this 'ere," pointing to her grandson, "how my ole mammy would sit out o' doors in the evenin', an' look up at the stars an' groan. She'd groan an' groan, an' says I to her,--

"'Mammy, what makes you groan so?'

"an' she'd say,--

"'Matter enough, chile! I'm groanin' to think o' my poor children: they don't know where I be, an' I don't know where they be; they looks up at the stars, an' I looks up at the stars, but I can't tell where they be.

"'Now,' she said, 'chile, when you're grown up, you may be sold away from your mother an' all your ole friends, an' have great troubles come on ye; an' when you has these troubles come on ye, ye jes' go to God, an' He'll help ye.'

"An' says I to her,--

"'Who is God, anyhow, mammy?'

"An' says she,--

"'Why, chile, you jes' look up DAR! It's Him that made all DEM!"

"Well, I didn't mind much 'bout God in them days. I grew up pretty lively an' strong, an' could row a boat, or ride a horse, or work round, an' do 'most anything.

"At last I got sold away to a real hard massa an' missis. Oh, I tell you, they WAS hard! 'Peared like I couldn't please 'em, nohow. An' then I thought o' what my old mammy told me about God; an' I thought I'd got into trouble, sure enough, an' I wanted to find God, an' I heerd some one tell a story about a man that met God on a threshin'-floor, an' I thought, 'Well an' good, I'll have a threshin'-floor, too.' So I went down in the lot, an' I threshed down a place real hard, an' I used to go down there every day, an' pray an' cry with all my might, a-prayin' to the Lord to make my massa an' missis better, but it didn't seem to do no good; an' so says I, one day,--

"'O God, I been a-askin' ye, an' askin' ye, an' askin' ye, for all this long time, to make my massa an' missis better, an' you don't do it, an' what CAN be the reason? Why, maybe you CAN'T. Well, I shouldn't wonder ef you couldn't. Well, now, I tell you, I'll make a bargain with you. Ef you'll help me to git away from my massa an' missis, I'll agree to be good; but ef you don't help me, I really don't think I can be. Now,' says I, 'I want to git away; but the trouble's jest here: ef I try to git away in the night, I can't see; an' ef I try to git away in the daytime, they'll see me, an' be after me.'

"Then the Lord said to me, 'Git up two or three hours afore daylight, an' start off.'

"An' says I, 'Thank 'ee, Lord! that's a good thought.'

"So up I got, about three o'clock in the mornin', an' I started an' travelled pretty fast, till, when the sun rose, I was clear away from our place an' our folks, an' out o' sight. An' then I begun to think I didn't know nothin' where to go. So I kneeled down, and says I,--

"'Well, Lord, you've started me out, an' now please to show me where to go.'

"Then the Lord made a house appear to me, an' He said to me that I was to walk on till I saw that house, an' then go in an' ask the people to take me. An' I travelled all day, an' didn't come to the house till late at night; but when I saw it, sure enough, I went in, an' I told the folks that the Lord sent me; an' they was Quakers, an' real kind they was to me. They jes' took me in, an' did for me as kind as ef I'd been one of 'em; an' after they'd giv me supper, they took me into a room where there was a great, tall, white bed; an' they told me to sleep there. Well, honey, I was kind o' skeered when they left me alone with that great white bed; 'cause I never had been in a bed in my life. It never came into my mind they could mean me to sleep in it. An' so I jes' camped down under it, on the floor, an' then I slep' pretty well. In the mornin', when they came in, they asked me ef I hadn't been asleep; an' I said, 'Yes, I never slep' better.' An' they said, 'Why, you haven't been in the bed!' An' says I, 'Laws, you didn't think o' such a thing as my sleepin' in dat 'ar' BED, did you? I never heerd o' such a thing in my life.'

"Well, ye see, honey, I stayed an' lived with 'em. An' now jes' look here: instead o' keepin' my promise an' bein' good, as I told the Lord I would, jest as soon as everything got a'goin' easy, I FORGOT ALL ABOUT GOD.

"Pretty well don't need no help; an' I gin up prayin.' I lived there two or three years, an' then the slaves in New York were all set free, an' ole massa came to our home to make a visit, an' he asked me ef I didn't want to go back an' see the folks on the ole place. An' I told him I did. So he said, ef I'd jes' git into the wagon with him, he'd carry me over. Well, jest as I was goin' out to git into the wagon, I MET GOD! an' says I, 'O God, I didn't know as you was so great!' An' I turned right round an' come into the house, an' set down in my room; for 't was God all around me. I could feel it burnin', burnin', burnin' all around me, an' goin' through me; an' I saw I was so wicked, it seemed as ef it would burn me up. An' I said, 'O somebody, somebody, stand between God an' me! for it burns me!' Then, honey, when I said so, I felt as it were somethin' like an amberill [umbrella] that came between me an' the light, an' I felt it was SOMEBODY,--somebody that stood between me an' God; an' it felt cool, like a shade; an' says I, 'Who's this that stands between me an' God? Is it old Cato?' He was a pious old preacher; but then I seemed to see Cato in the light, an' he was all polluted an' vile, like me; an' I said, 'Is it old Sally?' an' then I saw her, an' she seemed jes' so. An' then says I, 'WHO is this?' An' then, honey, for a while it was like the sun shinin' in a pail o' water, when it moves up an' down; for I begun to feel 't was somebody that loved me; an' I tried to know him. An' I said, 'I know you! I know you! I know you!'--an' then I said, 'I don't know you! I don't know you! I don't know you!' An' when I said, 'I know you, I know you,' the light came; an' when I said, 'I don't know you, I don't know you,' it went, jes' like the sun in a pail o' water. An' finally somethin' spoke out in me an' said, 'THIS IS JESUS!' An' I spoke out with all my might, an' says I, 'THIS IS JESUS! Glory be to God!' An' then the whole world grew bright, an' the trees they waved an' waved in glory, an' every little bit o' stone on the ground shone like glass; an' I shouted an' said, 'Praise, praise, praise to the Lord!' An' I begun to feel such a love in my soul as I never felt before,--love to all creatures. An' then, all of a sudden, it stopped, an' I said, 'Dar's de white folks, that have abused you an' beat you an' abused your people,--think o' them!' But then there came another rush of love through my soul, an' I cried out loud,--'Lord, Lord, I can love EVEN DE WHITE FOLKS!'

"Honey, I jes' walked round an' round in a dream. Jesus loved me! I knowed it,--I felt it. Jesus was my Jesus. Jesus would love me always. I didn't dare tell nobody; 't was a great secret. Everything had been got away from me that I ever had; an' I thought that ef I let white folks know about this, maybe they'd get HIM away,--so I said, 'I'll keep this close. I won't let any one know.'"

"But, Sojourner, had you never been told about Jesus Christ?"

"No, honey. I hadn't heerd no preachin',--been to no meetin'. Nobody hadn't told me. I'd kind o' heerd of Jesus, but thought he was like Gineral Lafayette, or some o' them. But one night there was a Methodist meetin' somewhere in our parts, an' I went; an' they got up an' begun for to tell der 'speriences; an' de fust one begun to speak. I started, 'cause he told about Jesus. 'Why,' says I to myself, 'dat man's found him, too!' An' another got up an' spoke, an I said, 'He's found him, too!' An' finally I said, 'Why, they all know him!' I was so happy! An' then they sung this hymn": (Here Sojourner sang, in a strange, cracked voice, but evidently with all her soul and might, mispronouncing the English, but seeming to derive as much elevation and comfort from bad English as from good):--

'There is a holy city, A world of light above, Above the stairs and regions,* Built by the God of Love.

"An Everlasting temple, And saints arrayed in white There serve their great Redeemer And dwell with him in light.

"The meanest child of glory Outshines the radiant sun; But who can speak the splendor Of Jesus on his throne?

"Is this the man of sorrows Who stood at Pilate's bar, Condemned by haughty Herod And by his men of war?

"He seems a mighty conqueror, Who spoiled the powers below, And ransomed many captives From everlasting woe.

"The hosts of saints around him Proclaim his work of grace, The patriarchs and prophets, And all the godly race,

"Who speak of fiery trials And tortures on their way; They came from tribulation To everlasting day.

"And what shall be my journey, How long I'll stay below, Or what shall be my trials, Are not for me to know.

"In every day of trouble I'll raise my thoughts on high, I'll think of that bright temple And crowns above the sky."

* Starry regions.

I put in this whole hymn, because Sojourner, carried away with her own feeling, sang it from beginning to end with a triumphant energy that held the whole circle around her intently listening. She sang with the strong barbaric accent of the native African, and with those indescribable upward turns and those deep gutturals which give such a wild, peculiar power to the negro singing,--but above all, with such an overwhelming energy of personal appropriation that the hymn seemed to be fused in the furnace of her feelings and come out recrystallized as a production of her own.

It is said that Rachel was wont to chant the "Marseillaise" in a manner that made her seem, for the time, the very spirit and impersonation of the gaunt, wild, hungry, avenging mob which rose against aristocratic oppression; and in like manner, Sojourner, singing this hymn, seemed to impersonate the fervor of Ethiopia, wild, savage, hunted of all nations, but burning after God in her tropic heart, and stretching her scarred hands towards the glory to be revealed.

"Well, den ye see, after a while, I thought I'd go back an' see de folks on de ole place. Well, you know, de law had passed dat de culled folks was all free; an' my old missis, she had a daughter married about dis time who went to live in Alabama,--an' what did she do but give her my son, a boy about de age of dis yer, for her to take down to Alabama? When I got back to de ole place, they told me about it, an' I went right up to see ole missis, an' says I,--

"'Missis, have you been an' sent my son away down to Alabama?'

"'Yes, I have,' says she; 'he's gone to live with your young missis.'

"'Oh, Missis,' says I, 'how could you do it?'

"'Poh!' says she, 'what a fuss you make about a little nigger! Got more of 'em now than you know what to do with.'

"I tell you, I stretched up. I felt as tall as the world!

"'Missis,' says I, 'I'LL HAVE MY SON BACK AGIN!'

"She laughed.

"'YOU will, you nigger? How you goin' to do it? You ha'n't got no money."

"'No, Missis,--but GOD has,--an' you'll see He'll help me!'--an' I turned round an' went out.

"Oh, but I WAS angry to have her speak to me so haughty an' so scornful, as ef my chile wasn't worth anything. I said to God, 'O Lord, render unto her double!' It was a dreadful prayer, an' I didn't know how true it would come.

"Well, I didn't rightly know which way to turn; but I went to the Lord, an' I said to Him, 'O Lord, ef I was as rich as you be, an' you was as poor as I be, I'd help you,--you KNOW I would; and, oh, do help me!' An' I felt sure then that He would.

"Well, I talked with people, an' they said I must git the case before a grand jury. So I went into the town when they was holdin' a court, to see ef I could find any grand jury. An' I stood round the court-house, an' when they was a-comin' out, I walked right up to the grandest-lookin' one I could see, an' says I to him,--

"'Sir, be you a grand jury?'

"An' then he wanted to know why I asked, an' I told him all about it; an' he asked me all sorts of questions, an' finally he says to me,--

"'I think, ef you pay me ten dollars, that I'd agree to git your son for you.' An' says he, pointin' to a house over the way, 'You go 'long an' tell your story to the folks in that house, an' I guess they'll give you the money.'

"Well, I went, an' I told them, an' they gave me twenty dollars; an' then I thought to myself, 'Ef ten dollars will git him, twenty dollars will git him SARTIN.' So I carried it to the man all out, an' said,--

"'Take it all,--only be sure an' git him.'

"Well, finally they got the boy brought back; an' then they tried to frighten him, an' to make him say that I wasn't his mammy, an' that he didn't know me; but they couldn't make it out. They gave him to me, an' I took him an' carried him home; an' when I came to take off his clothes, there was his poor little back all covered with scars an' hard lumps, where they'd flogged him.

"Well, you see, honey, I told you how I prayed the Lord to render unto her double. Well, it came true; for I was up at ole missis' house not long after, an' I heerd 'em readin' a letter to her how her daughter's husband had murdered her,--how he'd thrown her down an' stamped the life out of her, when he was in liquor; an' my ole missis, she giv a screech, an' fell flat on the floor. Then says I, 'O Lord, I didn't mean all that! You took me up too quick.'

"Well, I went in an' tended that poor critter all night. She was out of her mind,--a-cryin', an' callin' for her daughter; an' I held her poor ole head on my arm, an' watched for her as ef she'd been my babby. An' I watched by her, an' took care on her all through her sickness after that, an' she died in my arms, poor thing!"

"Well, Sojourner, did you always go by this name?"

"No, 'deed! My name was Isabella; but when I left the house of bondage, I left everything behind. I wa'n't goin' to keep nothin' of Egypt on me, an' so I went to the Lord an' asked Him to give me a new name. And the Lord gave me Sojourner, because I was to travel up an' down the land, showin' the people their sins, an' bein' a sign unto them. Afterwards I told the Lord I wanted another name, 'cause everybody else had two names; and the Lord gave me Truth, because I was to declare the truth to the people.

"Ye see some ladies have given me a white satin banner," she said, pulling out of her pocket and unfolding a white banner, printed with many texts, such as, "Proclaim liberty throughout all the land unto all the inhabitants thereof," and others of like nature. "Well," she said, "I journeys round to camp-meetins, an' wherever folks is, an' I sets up my banner, an' then I sings, an' then folks always comes up round me, an' then I preaches to 'em. I tells 'em about Jesus, an' I tells 'em about the sins of this people. A great many always comes to hear me; an' they're right good to me, too, an' say they want to hear me agin."

We all thought it likely; and as the company left her, they shook hands with her, and thanked her for her very original sermon; and one of the ministers was overheard to say to another, "There's more of the gospel in that story than in most sermons."

Sojourner stayed several days with us, a welcome guest. Her conversation was so strong, simple, shrewd, and with such a droll flavoring of humor, that the Professor was wont to say of an evening, "Come, I am dull, can't you get Sojourner up here to talk a little?" She would come up into the parlor, and sit among pictures and ornaments, in her simple stuff gown, with her heavy travelling-shoes, the central object of attention both to parents and children, always ready to talk or to sing, and putting into the common flow of conversation the keen edge of some shrewd remark.

"Sojourner, what do you think of Women's Rights?"

"Well, honey, I's ben to der meetins, an' harked a good deal. Dey wanted me for to speak. So I got up. Says I,--'Sisters, I a'n't clear what you'd be after. Ef women want any rights more 'n dey's got, why don't dey jes' TAKE 'EM, an' not be talkin' about it?' Some on 'em came round me, an' asked why I didn't wear Bloomers. An' I told 'em I had Bloomers enough when I was in bondage. You see," she said, "dey used to weave what dey called nigger-cloth, an' each one of us got jes' sech a strip, an' had to wear it width-wise. Them that was short got along pretty well, but as for me"--She gave an indescribably droll glance at her long limbs and then at us, and added,--"Tell YOU, I had enough of Bloomers in them days."

Sojourner then proceeded to give her views of the relative capacity of the sexes, in her own way.

"S'pose a man's mind holds a quart, an' a woman's don't hold but a pint; ef her pint is FULL, it's as good as his quart."

Sojourner was fond of singing an extraordinary lyric, commencing,--

"I'm on my way to Canada, That cold, but happy land; The dire effects of Slavery I can no longer stand. O righteous Father, Do look down on me, And help me on to Canada, Where colored folks are free!"

The lyric ran on to state, that, when the fugitive crosses the Canada line,

"The Queen comes down unto the shore, With arms extended wide, To welcome the poor fugitive Safe onto Freedom's side."

In the truth thus set forth she seemed to have the most simple faith.

But her chief delight was to talk of "glory," and to sing hymns whose burden was,--

"O glory, glory, glory, Won't you come along with me?"

and when left to herself, she would often hum these with great delight, nodding her head.

On one occasion, I remember her sitting at a window singing and fervently keeping time with her head, the little black Puck of a grandson meanwhile amusing himself with ornamenting her red-and-yellow turban with green dandelion-curls, which shook and trembled with her emotions, causing him perfect convulsions of delight.

"Sojourner," said the Professor to her, one day, when he heard her singing, "you seem to be very sure about heaven."

"Well, I be," she answered, triumphantly.

"What makes you so sure there is any heaven?"

"Well, 'cause I got such a hankerin' arter it in here," she said,--giving a thump on her breast with her usual energy.

There was at the time an invalid in the house, and Sojourner, on learning it, felt a mission to go and comfort her. It was curious to see the tall, gaunt, dusky figure stalk up to the bed with such an air of conscious authority, and take on herself the office of consoler with such a mixture of authority and tenderness. She talked as from above,--and at the same time, if a pillow needed changing or any office to be rendered, she did it with a strength and handiness that inspired trust. One felt as if the dark, strange woman were quite able to take up the invalid in her bosom, and bear her as a lamb, both physically and spiritually. There was both power and sweetness in that great warm soul and that vigorous frame.

At length, Sojourner, true to her name, departed. She had her mission elsewhere. Where now she is I know not; but she left deep memories behind her.

To these recollections of my own I will add one more anecdote, related by Wendell Phillips.

Speaking of the power of Rachel to move and bear down a whole audience by a few simple words, he said he never knew but one other human being that had that power, and that other was Sojourner Truth. He related a scene of which he was witness. It was at a crowded public meeting in Faneuil Hall, where Frederick Douglas was one of the chief speakers. Douglas had been describing the wrongs of the black race, and as he proceeded, he grew more and more excited, and finally ended by saying that they had no hope of justice from the whites, no possible hope except in their own right arms. It must come to blood; they must fight for themselves, and redeem themselves, or it would never be done.

Sojourner was sitting, tall and dark, on the very front seat, facing the platform; and in the hush of deep feeling, after Douglas sat down, she spoke out in her deep, peculiar voice, heard all over the house,--

"Frederick, IS GOD DEAD?"

The effect was perfectly electrical, and thrilled through the whole house, changing as by a flash the whole feeling of the audience. Not another word she said or needed to say; it was enough.

It is with a sad feeling that one contemplates noble minds and bodies, nobly and grandly formed human beings, that have come to us cramped, scarred, maimed, out of the prison-house of bondage. One longs to know what such beings might have become, if suffered to unfold and expand under the kindly developing influences of education.

It is the theory of some writers, that to the African is reserved, in the later and palmier days of the earth, the full and harmonious development of the religious element in man. The African seems to seize on the tropical fervor and luxuriance of Scripture imagery as something native; he appears to feel himself to be of the same blood with those old burning, simple souls, the patriarchs, prophets, and seers, whose impassioned words seem only grafted as foreign plants on the cooler stock of the Occidental mind.

I cannot but think that Sojourner with the same culture might have spoken words as eloquent and undying as those of the African Saint Augustine or Tertullian. How grand and queenly a woman she might have been, with her wonderful physical vigor, her great heaving sea of emotion, her power of spiritual conception, her quick penetration, and her boundless energy! We might conceive an African type of woman so largely made and moulded, so much fuller in all the elements of life, physical and spiritual, that the dark hue of the skin should seem only to add an appropriate charm,--as Milton says of his Penseroso, whom he imagines

"Black, but such as in esteem Prince Memnon's sister might beseem, Or that starred Ethiop queen that strove To set her beauty's praise above The sea-nymph's."

But though Sojourner Truth has passed away from among us as a wave of the sea, her memory still lives in one of the loftiest and most original works of modern art, the Libyan Sibyl, by Mr. Story, which attracted so much attention in the late World's Exhibition. Some years ago, when visiting Rome, I related Sojourner's history to Mr. Story at a breakfast at his house. Already had his mind begun to turn to Egypt in search of a type of art which should represent a larger and more vigorous development of nature than the cold elegance of Greek lines. His glorious Cleopatra was then in process of evolution, and his mind was working out the problem of her broadly developed nature, of all that slumbering weight and fulness of passion with which this statue seems charged, as a heavy thunder-cloud is charged with electricity.

The history of Sojourner Truth worked in his mind and led him into the deeper recesses of the African nature,--those unexplored depths of being and feeling, mighty and dark as the gigantic depths of tropical forests, mysterious as the hidden rivers and mines of that burning continent whose life-history is yet to be. A few days after, he told me that he had conceived the idea of a statue which he should call the Libyan Sibyl. Two years subsequently, I revisited Rome, and found the gorgeous Cleopatra finished, a thing to marvel at, as the creation of a new style of beauty, a new manner of art. Mr. Story requested me to come and repeat to him the history of Sojourner Truth, saying that the conception had never left him. I did so; and a day or two after, he showed me the clay model of the Libyan Sibyl. I have never seen the marble statue; but am told by those who have, that it was by far the most impressive work of art at the Exhibition.

A notice of the two statues from the London "Athenaeum" must supply a description which I cannot give.

"The Cleopatra and the Sibyl are seated, partly draped, with the characteristic Egyptian gown, that gathers about the torso and falls freely around the limbs; the first is covered to the bosom, the second bare to the hips. Queenly Cleopatra rests back against her chair in meditative ease, leaning her cheek against one hand, whose elbow the rail of the seat sustains; the other is outstretched upon her knee, nipping its forefinger upon the thumb thoughtfully, as though some firm, wilful purpose filled her brain, as it seems to

set those luxurious features to a smile as if the whole woman 'would.' Upon her head is the coif, bearing in front the mystic uraeus, or twining basilisk of sovereignty, while from its sides depend the wide Egyptian lappels, or wings, that fall upon her shoulders. The Sibilla Libica has crossed her knees,--an action universally held amongst the ancients as indicative of reticence or secrecy, and of power to bind. A secret-keeping looking dame she is, in the full-bloom proportions of ripe womanhood, wherein choosing to place his figure the sculptor has deftly gone between the disputed point whether these women were blooming and wise in youth, or deeply furrowed with age and burdened with the knowledge of centuries, as Virgil, Livy, and Gellius say. Good artistic example might be quoted on both sides. Her forward elbow is propped upon one knee; and to keep her secrets close, for this Libyan woman is the closest of all the Sibyls, she rests her shut mouth upon one closed palm, as if holding the African mystery deep in the brooding brain that looks out through mournful, warning eyes, seen under the wide shade of the strange horned (ammonite) crest, that bears the mystery of the Tetragrammaton upon its upturned front. Over her full bosom, mother of myriads as she was, hangs the same symbol. Her face has a Nubian cast, her hair wavy and plaited, as is meet."

We hope to see the day when copies both of the Cleopatra and the Libyan Sibyl shall adorn the Capitol at Washington.

RECONSTRUCTION by Frederick Douglass

The assembling of the Second Session of the Thirty-ninth Congress may very properly be made the occasion of a few earnest words on the already much-worn topic of reconstruction.

Seldom has any legislative body been the subject of a solicitude more intense, or of aspirations more sincere and ardent. There are the best of reasons for this profound interest. Questions of vast moment, left undecided by the last session of Congress, must be manfully grappled with by this. No political skirmishing will avail. The occasion demands statesmanship.

Whether the tremendous war so heroically fought and so victoriously ended shall pass into history a miserable failure, barren of permanent results,--a scandalous and shocking waste of blood and treasure,--a strife for empire, as Earl Russell characterized it, of no value to liberty or civilization,--an attempt to re-establish a Union by force, which must be the merest mockery of a Union,--an effort to bring under Federal authority States into which no loyal man from the North may safely enter, and to bring men into the national councils who deliberate with daggers and vote with revolvers, and who do not even conceal their deadly hate of the country that conquered them; or whether, on the other hand, we shall, as the rightful reward of victory over treason, have a solid nation, entirely delivered from all contradictions and social antagonisms, based upon loyalty, liberty, and equality, must be determined one way or the other by the present session of Congress. The last session really did nothing which can be considered final as to these questions. The Civil Rights Bill and the Freedmen's Bureau Bill and the proposed constitutional amendments, with the amendment already adopted and recognized as the law of the land, do not reach the difficulty, and cannot, unless the whole structure of the government is changed from a government by States to something like a despotic central government, with power to control even the municipal regulations of States, and to make them conform to its own despotic will. While there remains such an idea as the right of each State to control its own local affairs,--an idea, by the way, more deeply rooted in the minds of men of all sections of the country than perhaps any one other political idea,--no general assertion of human rights can be of any practical value. To change the character of the government at this point is neither possible nor desirable. All that is necessary to be done is to make the government consistent with itself, and render the rights of the States compatible with the sacred rights of human nature.

The arm of the Federal government is long, but it is far too short to protect the rights of individuals in the interior of distant States. They must have the power to protect themselves, or they will go unprotected, spite of all the laws the Federal government can put upon the national statute-book.

Slavery, like all other great systems of wrong, founded in the depths of human selfishness, and existing for ages, has not neglected its own conservation. It has steadily exerted an influence upon all around it favorable to its own continuance. And to-day it is so strong that it could exist, not only without law, but even against law. Custom, manners, morals, religion, are all on its side everywhere in the South; and when you add the ignorance and servility of the ex-slave to the intelligence and accustomed authority of the master, you have the conditions, not out of which slavery will again grow, but under which it is impossible for the Federal government to wholly destroy it, unless the Federal government be armed with despotic power, to blot out State authority, and to station a Federal officer at every cross-road. This, of course, cannot be done, and ought not even if it could. The true way and the easiest way is to make our government entirely consistent with itself, and give to every loyal citizen the elective franchise,--a right and power which will be ever present, and will form a wall of fire for his protection.

One of the invaluable compensations of the late Rebellion is the highly instructive disclosure it made of the true source of danger to republican government. Whatever may be tolerated in monarchical and despotic governments, no republic is safe that tolerates a privileged class, or denies to any of its citizens equal rights and equal means to maintain them. What was theory before the war has been made fact by the war.

There is cause to be thankful even for rebellion. It is an impressive teacher, though a stern and terrible one. In both characters it has come to us, and it was perhaps needed in both. It is an instructor never a day before its time, for it comes only when all other means of progress and enlightenment have failed. Whether the oppressed and despairing bondman, no longer able to repress his deep yearnings for manhood, or the tyrant, in his pride and impatience, takes the initiative, and strikes the blow for a firmer hold and a longer lease of oppression, the result is the same,--society is instructed, or may be.

Such are the limitations of the common mind, and so thoroughly engrossing are the cares of common life, that only the few among men can discern through the glitter and dazzle of present prosperity the dark outlines of approaching disasters, even though they may have come up to our very gates, and are already within striking distance. The yawning seam and corroded bolt conceal their defects from the mariner until the storm calls all hands to the pumps. Prophets, indeed, were abundant before the war; but who cares for prophets while their predictions remain unfulfilled, and the calamities of which they tell are masked behind a blinding blaze of national prosperity?

It is asked, said Henry Clay, on a memorable occasion, Will slavery never come to an end? That question, said he, was asked fifty years ago, and it has been answered by fifty years of unprecedented prosperity. Spite of the eloquence of the earnest Abolitionists,--poured out against slavery during thirty years,--even they must confess, that, in all the probabilities of the case, that system of barbarism would have continued its horrors far beyond the limits of the nineteenth century but for the Rebellion, and perhaps only have disappeared at last in a fiery conflict, even more fierce and bloody than that which has now been suppressed.

It is no disparagement to truth, that it can only prevail where reason prevails. War begins where reason ends. The thing worse than rebellion is the thing that causes rebellion. What that thing is, we have been taught to our cost. It remains now to be seen whether we have the needed courage to have that cause entirely removed from the Republic. At any rate, to this grand work of national regeneration and entire purification Congress must now address Itself, with full purpose that the work shall this time be thoroughly done. The deadly upas, root and branch, leaf and fibre, body and sap, must be utterly destroyed. The country is evidently not in a condition to listen patiently to pleas for postponement, however plausible, nor will it permit the responsibility to be shifted to other shoulders. Authority and power are here commensurate with the duty imposed. There are no cloud-flung shadows to obscure the way. Truth shines with brighter light and intenser heat at every moment, and a country torn and rent and bleeding implores relief from its distress and agony.

If time was at first needed, Congress has now had time. All the requisite materials from which to form an intelligent judgment are now before it. Whether its members look at the origin, the progress, the termination of the war, or at the mockery of a peace now existing, they will find only one unbroken chain of argument in favor of a radical policy of reconstruction. For the omissions of the last session, some excuses may be allowed. A treacherous President stood in the way; and it can be easily seen how reluctant good men might be to admit an apostasy which involved so much of baseness and ingratitude. It was natural that they should seek to save him by bending to him even when he leaned to the side of error. But all is changed now. Congress knows now that it must go on without his aid, and even against his machinations. The advantage of the present session over the last is immense. Where that investigated, this has the facts. Where that walked by faith, this may walk by sight. Where that halted, this must go forward, and where that failed, this must succeed, giving the country whole measures where that gave us half-measures, merely as a means of saving the elections in a few doubtful districts. That Congress saw what was right, but distrusted the enlightenment of the loyal masses; but what was forborne in distrust of the people must now be done with a full knowledge that the people expect and require it. The members go to Washington fresh from the inspiring presence of the people. In every considerable public meeting, and in almost every conceivable way, whether at court-house, school-house, or cross-roads, in doors and out, the subject has been discussed, and the people have emphatically pronounced in favor of a radical policy. Listening to the doctrines of expediency and compromise with pity, impatience, and disgust, they have everywhere broken into demonstrations of the wildest enthusiasm when a brave word has been spoken in favor of equal rights and impartial suffrage. Radicalism, so far from being odious, is not the popular passport to power. The men most bitterly charged with it go to Congress with the largest majorities, while the timid and doubtful are sent by lean majorities, or else left at home. The strange controversy between the President and the Congress, at one time so threatening, is disposed of by the people. The high reconstructive powers which he so confidently, ostentatiously, and haughtily

claimed, have been disallowed, denounced, and utterly repudiated; while those claimed by Congress have been confirmed.

Of the spirit and magnitude of the canvass nothing need be said. The appeal was to the people, and the verdict was worthy of the tribunal. Upon an occasion of his own selection, with the advice and approval of his astute Secretary, soon after the members of the Congress had returned to their constituents, the President quitted the executive mansion, sandwiched himself between two recognized heroes,--men whom the whole country delighted to honor,--and, with all the advantage which such company could give him, stumped the country from the Atlantic to the Mississippi, advocating everywhere his policy as against that of Congress. It was a strange sight, and perhaps the most disgraceful exhibition ever made by any President; but, as no evil is entirely unmixed, good has come of this, as from many others. Ambitious, unscrupulous, energetic, indefatigable, voluble, and plausible,--a political gladiator, ready for a "set-to" in any crowd,--he is beaten in his own chosen field, and stands to-day before the country as a convicted usurper, a political criminal, guilty of a bold and persistent attempt to possess himself of the legislative powers solemnly secured to Congress by the Constitution. No vindication could be more complete, no condemnation could be more absolute and humiliating. Unless reopened by the sword, as recklessly threatened in some circles, this question is now closed for all time.

Without attempting to settle here the metaphysical and somewhat theological question (about which so much has already been said and written), whether once in the Union means always in the Union,--agreeably to the formula, Once in grace always in grace,--it is obvious to common sense that the rebellious States stand to-day, in point of law, precisely where they stood when, exhausted, beaten, conquered, they fell powerless at the feet of Federal authority. Their State governments were overthrown, and the lives and property of the leaders of the Rebellion were forfeited. In reconstructing the institutions of these shattered and overthrown States, Congress should begin with a clean slate, and make clean work of it. Let there be no hesitation. It would be a cowardly deference to a defeated and treacherous President, if any account were made of the illegitimate, one-sided, sham governments hurried into existence for a malign purpose in the absence of Congress. These pretended governments, which were never submitted to the people, and from participation in which four millions of the loyal people were excluded by Presidential order, should now be treated according to their true character, as shams and impositions, and supplanted by true and legitimate governments, in the formation of which loyal men, black and white, shall participate.

It is not, however, within the scope of this paper to point out the precise steps to be taken, and the means to be employed. The people are less concerned about these than the grand end to be attained. They demand such a reconstruction as shall put an end to the present anarchical state of things in the late rebellious States,--where frightful murders and wholesale massacres are perpetrated in the very presence of Federal soldiers. This horrible business they require shall cease. They want a reconstruction such as will protect loyal men, black and white, in their persons and property; such a one as will cause Northern industry, Northern capital, and Northern civilization to flow into the South, and make a man from New England as much at home in Carolina as elsewhere in the Republic. No Chinese wall can now be tolerated. The South must be opened to the light of law and liberty, and this session of Congress is relied upon to accomplish this important work.

The plain, common-sense way of doing this work, as intimated at the beginning, is simply to establish in the South one law, one government, one administration of justice, one condition to the exercise of the elective franchise, for men of all races and colors alike. This great measure is sought as earnestly by loyal white men as by loyal blacks, and is needed alike by both. Let sound political prescience but take the place of an unreasoning prejudice, and this will be done.

Men denounce the negro for his prominence in this discussion; but it is no fault of his that in peace as in war, that in conquering Rebel armies as in reconstructing the rebellious States, the right of the negro is the true solution of our national troubles. The stern logic of events, which goes directly to the point, disdaining all concern for the color or features of men, has determined the interests of the country as identical with and inseparable from those of the negro.

The policy that emancipated and armed the negro--now seen to have been wise and proper by the dullest--was not certainly more sternly demanded than is now the policy of enfranchisement. If with the negro was success in war, and without him failure, so in peace it will be found that the nation must fall or flourish with the negro.

Fortunately, the Constitution of the United States knows no distinction between citizens on account of color. Neither does it know any difference between a citizen of a State and a citizen of the United States. Citizenship evidently includes all the rights of citizens, whether State or national. If the Constitution knows none, it is clearly no part of the duty of a Republican Congress now to institute one. The mistake of the last session was the attempt to do this very thing, by a renunciation of its power to secure political rights to any class of citizens, with the obvious purpose to allow the rebellious States to disfranchise, if they should see fit, their colored

citizens. This unfortunate blunder must now be retrieved, and the emasculated citizenship given to the negro supplanted by that contemplated in the Constitution of the United States, which declares that the citizens of each State shall enjoy all the rights and immunities of citizens of the several States,--so that a legal voter in any State shall be a legal voter in all the States.

AN APPEAL TO CONGRESS FOR IMPARTIAL SUFFRAGE by Frederick Douglas

A very limited statement of the argument for impartial suffrage, and for including the negro in the body politic, would require more space than can be reasonably asked here. It is supported by reasons as broad as the nature of man, and as numerous as the wants of society. Man is the only government-making animal in the world. His right to a participation in the production and operation of government is an inference from his nature, as direct and self-evident as is his right to acquire property or education. It is no less a crime against the manhood of a man, to declare that he shall not share in the making and directing of the government under which he lives, than to say that he shall not acquire property and education. The fundamental and unanswerable argument in favor of the enfranchisement of the negro is found in the undisputed fact of his manhood. He is a man, and by every fact and argument by which any man can sustain his right to vote, the negro can sustain his right equally. It is plain that, if the right belongs to any, it belongs to all. The doctrine that some men have no rights that others are bound to respect, is a doctrine which we must banish as we have banished slavery, from which it emanated. If black men have no rights in the eyes of white men, of course the whites can have none in the eyes of the blacks. The result is a war of races, and the annihilation of all proper human relations.

But suffrage for the negro, while easily sustained upon abstract principles, demands consideration upon what are recognized as the urgent necessities of the case. It is a measure of relief,--a shield to break the force of a blow already descending with violence, and render it harmless. The work of destruction has already been set in motion all over the South. Peace to the country has literally meant war to the loyal men of the South, white and black; and negro suffrage is the measure to arrest and put an end to that dreadful strife.

Something then, not by way of argument, (for that has been done by Charles Sumner, Thaddeus Stevens, Wendell Phillips, Gerrit Smith, and other able men,) but rather of statement and appeal.

For better or for worse, (as in some of the old marriage ceremonies,) the negroes are evidently a permanent part of the American population. They are too numerous and useful to be colonized, and too enduring and self-perpetuating to disappear by natural causes. Here they are, four millions of them, and, for weal or for woe, here they must remain. Their history is parallel to that of the country; but while the history of the latter has been cheerful and bright with blessings, theirs has been heavy and dark with agonies and curses. What O'Connell said of the history of Ireland may with greater truth be said of the negro's. It may be "traced like a wounded man through a crowd, by the blood." Yet the negroes have marvellously survived all the exterminating forces of slavery, and have emerged at the end of two hundred and fifty years of bondage, not morose, misanthropic, and revengeful, but cheerful, hopeful, and forgiving. They now stand before Congress and the country, not complaining of the past, but simply asking for a better future. The spectacle of these dusky millions thus imploring, not demanding, is touching; and if American statesmen could be moved by a simple appeal to the nobler elements of human nature, if they had not fallen, seemingly, into the incurable habit of weighing and measuring every proposition of reform by some standard of profit and loss, doing wrong from choice, and right only from necessity or some urgent demand of human selfishness, it would be enough to plead for the negroes on the score of past services and sufferings. But no such appeal shall be relied on here. Hardships, services, sufferings, and sacrifices are all waived. It is true that they came to the relief of the country at the hour of its extremest need. It is true that, in many of the rebellious States, they were almost the only reliable friends the nation had throughout the whole tremendous war. It is true that, notwithstanding their alleged ignorance, they were wiser than their masters, and knew enough to be loyal, while those masters only knew enough to be rebels and traitors. It is true that they fought side by side in the loyal cause with our gallant and patriotic white soldiers, and that, but for their help,--divided as the loyal States were,--the Rebels might have succeeded in breaking up the Union, thereby entailing border wars and troubles of unknown duration and incalculable calamity. All this and more is true of these loyal negroes. Many daring exploits will be told to their credit. Impartial history will paint them as men who deserved well of their country. It will tell how they forded and swam rivers, with what consummate address they evaded the sharp-eyed Rebel pickets, how they toiled in the darkness of night through the tangled marshes of briers and thorns, barefooted and weary, running the risk of losing their lives, to warn our generals of Rebel schemes to surprise and destroy our loyal army. It will tell how these poor people, whose rights we still despised, behaved to our wounded soldiers, when found cold, hungry, and bleeding on the deserted battle-field; how they assisted our escaping prisoners from Andersonville, Belle Isle, Castle Thunder, and elsewhere, sharing with them their wretched crusts, and otherwise affording them aid and comfort; how they promptly responded to the trumpet call for their services, fighting against a foe

that denied them the rights of civilized warfare, and for a government which was without the courage to assert those rights and avenge their violation in their behalf; with what gallantry they flung themselves upon Rebel fortifications, meeting death as fearlessly as any other troops in the service. But upon none of these things is reliance placed. These facts speak to the better dispositions of the human heart; but they seem of little weight with the opponents of impartial suffrage.

It is true that a strong plea for equal suffrage might be addressed to the national sense of honor. Something, too, might be said of national gratitude. A nation might well hesitate before the temptation to betray its allies. There is something immeasurably mean, to say nothing of the cruelty, in placing the loyal negroes of the South under the political power of their Rebel masters. To make peace with our enemies is all well enough; but to prefer our enemies and sacrifice our friends,--to exalt our enemies and cast down our friends,--to clothe our enemies, who sought the destruction of the government, with all political power, and leave our friends powerless in their hands,--is an act which need not be characterized here. We asked the negroes to espouse our cause, to be our friends, to fight for us, and against their masters; and now, after they have done all that we asked them to do,--helped us to conquer their masters, and thereby directed toward themselves the furious hate of the vanquished,--it is proposed in some quarters to turn them over to the political control of the common enemy of the government and of the negro. But of this let nothing be said in this place. Waiving humanity, national honor, the claims of gratitude, the precious satisfaction arising from deeds of charity and justice to the weak and defenceless,--the appeal for impartial suffrage addresses itself with great pertinency to the darkest, coldest, and flintiest side of the human heart, and would wring righteousness from the unfeeling calculations of human selfishness.

For in respect to this grand measure it is the good fortune of the negro that enlightened selfishness, not less than justice, fights on his side. National interest and national duty, if elsewhere separated, are firmly united here. The American people can, perhaps, afford to brave the censure of surrounding nations for the manifest injustice and meanness of excluding its faithful black soldiers from the ballot-box, but it cannot afford to allow the moral and mental energies of rapidly increasing millions to be consigned to hopeless degradation.

Strong as we are, we need the energy that slumbers in the black man's arm to make us stronger. We want no longer any heavy-footed, melancholy service from the negro. We want the cheerful activity of the quickened manhood of these sable millions. Nor can we afford to endure the moral blight which the existence of a degraded and hated class must necessarily inflict upon any people among whom such a class may exist. Exclude the negroes as a class from political rights,--teach them that the high and manly privilege of suffrage is to be enjoyed by white citizens only,--that they may bear the burdens of the state, but that they are to have no part in its direction or its honors,--and you at once deprive them of one of the main incentives to manly character and patriotic devotion to the interests of the government; in a word, you stamp them as a degraded caste,--you teach them to despise themselves, and all others to despise them. Men are so constituted that they largely derive their ideas of their abilities and their possibilities from the settled judgments of their fellow-men, and especially from such as they read in the institutions under which they live. If these bless them, they are blest indeed; but if these blast them, they are blasted indeed. Give the negro the elective franchise, and you give him at once a powerful motive for all noble exertion, and make him a man among men. A character is demanded of him, and here as elsewhere demand favors supply. It is nothing against this reasoning that all men who vote are not good men or good citizens. It is enough that the possession and exercise of the elective franchise is in itself an appeal to the nobler elements of manhood, and imposes education as essential to the safety of society.

To appreciate the full force of this argument, it must be observed, that disfranchisement in a republican government based upon the idea of human equality and universal suffrage, is a very different thing from disfranchisement in governments based upon the idea of the divine right of kings, or the entire subjugation of the masses. Masses of men can take care of themselves. Besides, the disabilities imposed upon all are necessarily without that bitter and stinging element of invidiousness which attaches to disfranchisement in a republic. What is common to all works no special sense of degradation to any. But in a country like ours, where men of all nations, kindred, and tongues are freely enfranchised, and allowed to vote, to say to the negro, You shall not vote, is to deal his manhood a staggering blow, and to burn into his soul a bitter and goading sense of wrong, or else work in him a stupid indifference to all the elements of a manly character. As a nation, we cannot afford to have amongst us either this indifference and stupidity, or that burning sense of wrong. These sable millions are too powerful to be allowed to remain either indifferent or discontented. Enfranchise them, and they become self-respecting and country-loving citizens. Disfranchise them, and the mark of Cain is set upon them less mercifully than upon the first murderer, for no man was to hurt him. But this mark of inferiority--all the more palpable because of a difference of color--not only dooms the negro to be a vagabond, but makes him the prey of insult and outrage everywhere. While nothing may be urged here as to the past services of the negro, it is quite within the line of this appeal to remind the nation of the possibility that a time may come when the services of the negro may be a second time required. History is

said to repeat itself, and, if so, having wanted the negro once, we may want him again. Can that statesmanship be wise which would leave the negro good ground to hesitate, when the exigencies of the country required his prompt assistance? Can that be sound statesmanship which leaves millions of men in gloomy discontent, and possibly in a state of alienation in the day of national trouble? Was not the nation stronger when two hundred thousand sable soldiers were hurled against the Rebel fortifications, than it would have been without them? Arming the negro was an urgent military necessity three years ago,--are we sure that another quite as pressing may not await us? Casting aside all thought of justice and magnanimity, is it wise to impose upon the negro all the burdens involved in sustaining government against foes within and foes without, to make him equal sharer in all sacrifices for the public good, to tax him in peace and conscript him in war, and then coldly exclude him from the ballot-box?

Look across the sea. Is Ireland, in her present condition, fretful, discontented, compelled to support an establishment in which she does not believe, and which the vast majority of her people abhor, a source of power or of weakness to Great Britain? Is not Austria wise in removing all ground of complaint against her on the part of Hungary? And does not the Emperor of Russia act wisely, as well as generously, when he not only breaks up the bondage of the serf, but extends him all the advantages of Russian citizenship? Is the present movement in England in favor of manhood suffrage--for the purpose of bringing four millions of British subjects into full sympathy and co-operation with the British government--a wise and humane movement, or otherwise? Is the existence of a rebellious element in our borders--which New Orleans, Memphis, and Texas show to be only disarmed, but at heart as malignant as ever, only waiting for an opportunity to reassert itself with fire and sword--a reason for leaving four millions of the nation's truest friends with just cause of complaint against the Federal government? If the doctrine that taxation should go hand in hand with representation can be appealed to in behalf of recent traitors and rebels, may it not properly be asserted in behalf of a people who have ever been loyal and faithful to the government? The answers to these questions are too obvious to require statement. Disguise it as we may, we are still a divided nation. The Rebel States have still an anti-national policy. Massachusetts and South Carolina may draw tears from the eyes of our tender-hearted President by walking arm in arm into his Philadelphia Convention, but a citizen of Massachusetts is still an alien in the Palmetto State. There is that, all over the South, which frightens Yankee industry, capital, and skill from its borders. We have crushed the Rebellion, but not its hopes or its malign purposes. The South fought for perfect and permanent control over the Southern laborer. It was a war of the rich against the poor. They who waged it had no objection to the government, while they could use it as a means of confirming their power over the laborer. They fought the government, not because they hated the government as such, but because they found it, as they thought, in the way between them and their one grand purpose of rendering permanent and indestructible their authority and power over the Southern laborer. Though the battle is for the present lost, the hope of gaining this object still exists, and pervades the whole South with a feverish excitement. We have thus far only gained a Union without unity, marriage without love, victory without peace. The hope of gaining by politics what they lost by the sword, is the secret of all this Southern unrest; and that hope must be extinguished before national ideas and objects can take full possession of the Southern mind. There is but one safe and constitutional way to banish that mischievous hope from the South, and that is by lifting the laborer beyond the unfriendly political designs of his former master. Give the negro the elective franchise, and you at once destroy the purely sectional policy, and wheel the Southern States into line with national interests and national objects. The last and shrewdest turn of Southern politics is a recognition of the necessity of getting into Congress immediately, and at any price. The South will comply with any conditions but suffrage for the negro. It will swallow all the unconstitutional test oaths, repeal all the ordinances of Secession, repudiate the Rebel debt, promise to pay the debt incurred in conquering its people, pass all the constitutional amendments, if only it can have the negro left under its political control. The proposition is as modest as that made on the mountain: "All these things will I give unto thee if thou wilt fall down and worship me."

But why are the Southerners so willing to make these sacrifices? The answer plainly is, they see in this policy the only hope of saving something of their old sectional peculiarities and power. Once firmly seated in Congress, their alliance with Northern Democrats re-established, their States restored to their former position inside the Union, they can easily find means of keeping the Federal government entirely too busy with other important matters to pay much attention to the local affairs of the Southern States. Under the potent shield of State Rights, the game would be in their own hands. Does any sane man doubt for a moment that the men who followed Jefferson Davis through the late terrible Rebellion, often marching barefooted and hungry, naked and penniless, and who now only profess an enforced loyalty, would plunge this country into a foreign war to-day, if they could thereby gain their coveted independence, and their still more coveted mastery over the negroes? Plainly enough, the peace not less than the prosperity of this country is involved in the great measure of impartial suffrage. King Cotton is deposed, but only deposed, and is ready to-day to reassert all his ancient pretensions upon the first favorable opportunity. Foreign countries abound with his agents. They are able, vigilant, devoted. The young men of the South burn with the desire to regain what they call the lost cause; the women are noisily malignant towards the Federal government. In fact, all the elements of treason and rebellion are there under the

thinnest disguise which necessity can impose.

What, then, is the work before Congress? It is to save the people of the South from themselves, and the nation from detriment on their account. Congress must supplant the evident sectional tendencies of the South by national dispositions and tendencies. It must cause national ideas and objects to take the lead and control the politics of those States. It must cease to recognize the old slave-masters as the only competent persons to rule the South. In a word, it must enfranchise the negro, and by means of the loyal negroes and the loyal white men of the South build up a national party there, and in time bridge the chasm between North and South, so that our country may have a common liberty and a common civilization. The new wine must be put into new bottles. The lamb may not be trusted with the wolf. Loyalty is hardly safe with traitors.

Statesmen of America! beware what you do. The ploughshare of rebellion has gone through the land beam-deep. The soil is in readiness, and the seed-time has come. Nations, not less than individuals, reap as they sow. The dreadful calamities of the past few years came not by accident, nor unbidden, from the ground. You shudder to-day at the harvest of blood sown in the spring-time of the Republic by your patriot fathers. The principle of slavery, which they tolerated under the erroneous impression that it would soon die out, became at last the dominant principle and power at the South. It early mastered the Constitution, became superior to the Union, and enthroned itself above the law.

Freedom of speech and of the press it slowly but successfully banished from the South, dictated its own code of honor and manners to the nation, brandished the bludgeon and the bowie-knife over Congressional debate, sapped the foundations of loyalty, dried up the springs of patriotism, blotted out the testimonies of the fathers against oppression, padlocked the pulpit, expelled liberty from its literature, invented nonsensical theories about master-races and slave-races of men, and in due season produced a Rebellion fierce, foul, and bloody.

This evil principle again seeks admission into our body politic. It comes now in shape of a denial of political rights to four million loyal colored people. The South does not now ask for slavery. It only asks for a large degraded caste, which shall have no political rights. This ends the case. Statesmen, beware what you do. The destiny of unborn and unnumbered generations is in your hands. Will you repeat the mistake of your fathers, who sinned ignorantly? or will you profit by the blood-bought wisdom all round you, and forever expel every vestige of the old abomination from our national borders? As you members of the Thirty-ninth Congress decide, will the country be peaceful, united, and happy, or troubled, divided, and miserable.

THE NEGRO EXODUS by James B. Runnion

A recent sojourn in the South for a few weeks, chiefly in Louisiana and Mississippi, gave the writer an opportunity to inquire into what has been so aptly called "the negro exodus." The emigration of blacks to Kansas began early in the spring of this year. For a time there was a stampede from two or three of the river parishes in Louisiana and as many counties opposite in Mississippi. Several thousand negroes (certainly not fewer than five thousand, and variously estimated as high as ten thousand) had left their cabins before the rush could be stayed or the excitement lulled. Early in May most of the negroes who had quit work for the purpose of emigrating, but had not succeeded in getting off, were persuaded to return to the plantations, and from that time on there have been only straggling families and groups that have watched for and seized the first opportunity for transportation to the North. There is no doubt, however, that there is still a consuming desire among the negroes of the cotton districts in these two States to seek new homes, and there are the best reasons for believing that the exodus will take a new start next spring, after the gathering and conversion of the growing crop. Hundreds of negroes who returned from the river-banks for lack of transportation, and thousands of others infected with the ruling discontent, are working harder in the fields this summer, and practicing more economy and self-denial than ever before, in order to have the means next winter and spring to pay their way to the "promised land."

"We've been working for fourteen long years," said an intelligent negro, in reply to a question as to the cause of the prevailing discontent, "and we ain't no better off than we was when we commenced." This is the negro version of the trouble, which is elaborated on occasion into a harrowing story of oppression and plunder.

"I tell you it's all owing to the radical politicians at the North," explained a representative of the type known as the Bourbons; "they've had their emissaries down here, and deluded the 'niggers' into a very fever of emigration, with the purpose of reducing our basis of representation in Congress and increasing that of the Northern States."

These are the two extremes of opinion at the South. The first is certainly the more reasonable and truthful, though it implies that all the blame rests upon the whites, which is not the case; the second, preposterous as it will appear to Northern readers, is religiously believed by large numbers of the "unreconciled." Between these two extremes there is an infinite variety of theories, all more or less governed by the political faction to which the various theorizers belong; there are at least a dozen of these factions, such as the Bourbons, the conservatives, the native white republicans, the carpet-bag republicans, the negro republicans, etc. There is a political tinge in almost everything in the extreme Southern States. The fact seems to be that the emigration movement among the blacks was spontaneous to the extent that they were ready and anxious to go. The immediate notion of going may have been inculcated by such circulars, issued by railroads and land companies, as are common enough at emigrant centres in the North and West, and the exaggeration characteristic of such literature may have stimulated the imagination of the negroes far beyond anything they are likely to realize in their new homes. Kansas was naturally the favorite goal of the negro emigre, for it was associated in his mind with the names of Jim Lane and John Brown, which are hallowed to him. The timid learned that they could escape what they have come to regard as a second bondage, and they flocked together to gain the moral support which comes from numbers.

Diligent inquiry among representative men, of all classes and from all parts of Louisiana, who were in attendance at the constitutional convention in New Orleans, and careful observation along the river among the land owners and field hands in both Louisiana and Mississippi, left a vivid impression of some material and political conditions which fully account for the negro exodus. I have dropped the social conditions out of the consideration, because I became convinced that the race troubles at the South can be solved to the satisfaction of both whites and blacks without cultivating any closer social relations than those which now prevail. The material conditions which I have in mind are less familiar than the political conditions; they are mainly the land-tenure and credit systems, and mere modifications (scarcely for the better) of the peculiar plantation system of slavery days.

The cotton lands at the South are owned now, as they were before the war, in large tracts. The land was about all that most of the Southern whites had left to them after the war, and they kept it when they could, at the first, in the hope that it would yield them a living through the labor of the blacks; of late years they have not been able to sell their plantations at any fair price, if they desired to do so. The white men with capital who went to the South from the North after the war seemed to acquire the true Southern ambition to be large land owners and planters; and when the ante-bellum owners lost their plantations the land usually went in bulk to the city factors who had made them advances from year to year, and had taken mortgages on their crops and broad acres. As a consequence, the land has never been distributed among the people who inhabit and cultivate it, and agricultural labor in the Southern States approaches the condition of the factory labor in England and the Eastern States more nearly than it does the farm labor of the North and West. Nearly every agricultural laborer north of Mason and Dixon's line, if not the actual possessor of the land he plows, looks forward to owning a farm some time; at the South such an ambition is rare, and small ownership still more an exception. The practice of paying day wages was first tried after the war; this practice is still in vogue in the sugar and rice districts, where laborers are paid from fifty to seventy cents per day, with quarters furnished and living guaranteed them at nine or ten cents a day. In sections where the wages system prevails, and where there have been no political disturbances, the negroes seem to be perfectly contented; at all events, the emigration fever has not spread among them. But it was found impracticable to maintain the wage system in the cotton districts. The negroes themselves fought against it, because it reminded them too much of the slave-gang, driven out at daybreak and home at sundown. In many cases the planters were forced to abandon it, because they had not the means to carry on such huge farming, and they could not secure the same liberal advances from capitalists as when they were able to mortgage a growing "crop of niggers." Then the system of working on shares was tried. This was reasonably fair, and the negro laborers were satisfied as long as it lasted. The owners of the land, under this system, would furnish the indispensable mule and the farming implements, and take one half the product. The planters themselves relinquished this system. Some of them contend that the laziness and indifference of the negro made the partnership undesirable; many others admit that they were not able to advance the negro tenant his supplies pending the growth of the year's crop, as it was necessary they should do under the sharing system. Now the renting system is almost universal. It yields the land owner a certainty, endangered only by the death, sickness, or desertion of the negro tenant; but it throws the latter upon his own responsibility, and frequently makes him the victim of his own ignorance and the rapacity of the white man. The rent of land, on a money basis, varies from six to ten dollars an acre per year, while the same land can be bought in large quantities all the way from fifteen to thirty dollars per acre, according to location, clearing, improvement, richness, etc. When paid in product, the rent varies from eighty to one hundred pounds of lint cotton per acre for land that produces from two hundred to four hundred pounds of cotton per acre; the tenant undertakes to pay from one quarter to one half--perhaps an average of one third--of his crop for the use of the land, without stock, tools, or assistance of any kind. The land owners usually claim that they make no money even at these exorbitant figures. If they do not, it is because

only a portion of their vast possessions is under cultivation, because they do no work themselves, and in some cases because the negroes do not cultivate and gather as large a crop as they could and ought to harvest. It is very certain that the negro tenants, as a class, make no money; if they are out of debt at the end of a season, they have reason to rejoice.

The credit system, which is as universal as the renting system, is even more illogical and oppressive. The utter viciousness of both systems in their mutual dependence is sufficiently illustrated by the single fact that, after fourteen years of freedom and labor on their own account, the great mass of the negroes depend for their living on an advance of supplies (as they need food, clothing, or tools during the year) upon the pledge of their growing crop. This is a generic imitation of the white man's improvidence during the slavery times; then the planters mortgaged their crops and negroes, and where one used the advances to extend his plantation, ten squandered the money. The negro's necessities have developed an offensive race, called merchants by courtesy, who keep supply stores at the cross-roads and steamboat landings, and live upon extortion. These people would be called sharks, harpies, and vampires in any Northwestern agricultural community, and they would not survive more than one season. The country merchant advances the negro tenant such supplies as the negro wants up to a certain amount, previously fixed by contract, and charges the negro at least double the value of every article sold to him. There is no concealment about the extortion; every store-keeper has his cash price and his credit price, and in nearly all cases the latter is one hundred per cent. higher than the former. The extortion is justified by those who practice it on the ground that their losses by bad debts, though their advances are always secured by mortgage on the growing crop, overbalance the profits; this assertion is scarcely borne out by the comparative opulence of the "merchant" and the pitiful poverty of the laborer. Some of the largest and wealthiest planters have sought to protect their tenants from the merciless clutches of the contrary merchant, who is more frequently than not an Israelite, by advancing supplies of necessary articles at reasonable prices. But the necessities of the planter, if not his greed, often betray him into plundering the negro. The planter himself is generally a victim to usury. He still draws on the city factor to the extent of ten dollars a bale upon his estimated crop. He pays this factor two and one half per cent. commission for the advance, eight per cent. interest for the money, two and one half per cent. more for disposing of the crop when consigned to him, and sometimes still another commission for the purchase of the supplies. The planter who furnishes his tenants with supplies on credit is usually paying an interest of fifteen to eighteen per cent. himself, and necessarily takes some risk in advancing upon an uncertain crop and to a laborer whom he believes to be neither scrupulous nor industrious; these conditions necessitate more than the ordinary profit, and in many cases suggest exorbitant and unreasonable charges. But whether the negro deals with the merchant or the land owner, his extravagance almost invariably exhausts his credit, even if it be large. The negro is a sensuous creature, and luxurious in his way. The male is an enormous consumer of tobacco and whisky; the female has an inordinate love for flummery; both are fond of sardines, potted meats, and canned goods generally, and they indulge themselves without any other restraint than the refusal of their merchant to sell to them. The man who advances supplies watches his negro customers constantly; if they are working well and their crop promises to be large, he will permit and even encourage them to draw upon him liberally; it is only a partial failure of the crop, or some intimation of the negro's intention to shirk his obligations, that induces his country factor to preach the virtue of self-restraint, or moralize upon the advantages of economy.

The land owner's rent and the merchant's advances are both secured by a chattel mortgage on the tenant's personal property, and by a pledge of the growing crop. The hired laborer (for it is common for negroes to work for wages for other negroes who rent lands) has also a lien upon the growing crops second only to the land owner's; but as the law requires that the liens shall be recorded, which the ignorant laborer usually neglects and the shrewd merchant never fails to do, the former is generally cheated of his security. Among those who usually work for hire are the women, who are expert cotton pickers, and the loss of wages which so many of them have suffered by reason of the prior lien gained by landlord and merchant has helped to make them earnest and effective advocates of emigration. The Western farmer considers it hard enough to struggle under one mortgage at a reasonable interest; the negro tenant begins his season with three mortgages, covering all he owns, his labor for the coming year, and all he expects to acquire during that period. He pays one third his product for the use of the land; he pays double the value of all he consumes; he pays an exorbitant fee for recording the contract by which he pledges his pound of flesh; he is charged two or three times as much as he ought to pay for ginning his cotton; and, finally, he turns over his crop to be eaten up in commissions, if anything still be left to him. It is easy to understand why the negro rarely gets ahead in the world. This mortgaging of future services, which is practically what a pledge of the growing crop amounts to, is in the nature of bondage. It has a tendency to make the negro extravagant, reckless, and unscrupulous; he has become convinced from previous experience that nothing will be coming to him on the day of settlement, and he is frequently actuated by the purpose of getting as much as possible and working as little as possible. Cases are numerous in which the negro abandons his own crop at picking time, because he knows that he has already eaten up its full value; and so he goes to picking for wages on some other plantation. In other cases, where negroes have

acquired mules and farming implements upon which a merchant has secured a mortgage in the manner described, they are practically bound to that merchant from year to year, in order to retain their property; if he removes from one section to another, they must follow him, and rent and cultivate lands in his neighborhood. It is only the ignorance, the improvidence, and the happy disposition of the negro, under the influence of the lazy, drowsy climate, to which he is so well adapted physically, that have enabled him to endure these hardships so long. And, though the negro is the loser, the white man is not often the gainer, from this false plantation and mercantile system. The incidental risk may not be so large as the planter and merchant pretend, but the condition of the people is an evidence that the extortion they practice yields no better profit in the long run than would be gained by competition in fair prices on a cash system; and in leading up to a general emigration of the laboring population the abuses described will eventually ruin and impoverish those who have heretofore been the only beneficiaries thereof. The decay of improvements inevitable under annual rentings, the lack of sufficient labor to cultivate all the good land, and the universal idleness of the rural whites have kept the land owners comparatively poor; the partial failure of crops and the unscrupulousness of the negro debtor, engendered by the infamous exactions of his creditor, have prevented the merchants, as a class, from prospering as much as might be supposed; and, finally, the uniform injustice to the laborers induces them to fly to ills they know not of, rather than bear those they have. It is a blessing to the negro that the laws do not yet provide for a detention of the person in the case of debt, or escape would be shut off entirely; as it is, various influences and circumstances appertaining to the system in vogue have been used to prevent the easy flight of those who desire to go, and have detained thousands of blacks for a time who are fretting to quit the country.

Political oppression has contributed largely to the discontent which is the prime cause of the exodus. "Bulldozing" is the term by which all forms of this oppression are known. The native whites are generally indisposed to confess that the negroes are quitting the country on account of political injustice and persecution; even those who freely admit and fitly characterize the abuses already described seek to deny, or at least belittle, the political abuses. The fact that a large number of negroes have emigrated from Madison Parish, Louisiana, where there has never been any bulldozing, and where the negroes are in full and undisputed political control, is cited as proof that political disturbances cut no figure in the case. But the town of Delta, in Madison Parish, is at once on the river and the terminus of a railroad that runs back through the interior of the State; thus Madison Parish would furnish the natural exit for the fugitives from the adjoining counties, where there have been political disturbances. It would be just as reasonable to contend that the plundering of the negroes has had no influence in driving them away, since many of those who have emigrated were among the most prosperous of the blacks, as to deny the agency of political persecution. Families that had been able to accumulate a certain amount of personal property, in spite of the extortionate practices, sold their mules, their implements, their cows, their pigs, their sheep, and their household goods for anything they would bring,--frequently as low as one sixth of their value,--in order that they might improve an immediate opportunity to go away; it is evident that there must have been some cause outside of extortion in their case. There are candid native whites who do not deny, but justify, the violent methods which have been employed to disfranchise the negroes, or compel them to vote under white dictation, in many parts of Louisiana and Mississippi, on the ground that the men who pay the taxes should vote them and control the disbursement of the public moneys. The gentlemen who advance this argument seem to ignore the fact that the very Northerner whom they are seeking to convert to "the Mississippi plan" may himself be a taxpayer in some Northern city, where public affairs are controlled by a class of voters in every way as ignorant and irresponsible as the blacks, but where bulldozing has never yet been suggested as a remedy. For the rest, the evidences of political oppression are abundant and convincing. The bulldozers as a class are more impecunious and irresponsible than the negroes, and, unlike the negroes, they will not work. There has been more of the "night-riding," the whippings, the mysterious disappearances, the hangings, and the terrorism comprehended in the term bulldozing than has been reported by those "abstracts and brief chronicles of the time," the Southern newspapers, which are now all of one party, and defer to the ruling sentiment among the whites. The exodus has wrung from two or three of the more candid and independent journals, however, a virtual confession of the fiendish practices of bulldozing in their insistance that these practices must be abandoned. The non-resident land owners and the resident planters, the city factors and the country merchants of means and respectability, have taken no personal part in the terrorizing of the negro, but they have tolerated it, and sometimes encouraged it, in order to gratify their preference for "white government." The negroes have suffered the more because they have not resisted and defended themselves; now they have begun to convince those who have persecuted them that, if they will not strike back, they can and will run away. No one who is at all familiar with the freedman can doubt that the abridgment of his political rights has been one of the main causes of the exodus. Voting is widely regarded at the North as a disagreeable duty, but the negro looks upon it as the highest privilege in life; to be frightened out of the exercise of this privilege, or compelled to exercise it in conflict with his convictions and preferences, is to suffer from a cruel injustice, which the negro will now try to escape, since he has learned that escape is possible. The women, though free from personal assaults, suffer from the terrorism that prevails in certain districts as much as the

men. "We might as well starve or freeze to death in Kansas," they say, "as to be shot-gunned here." If they talk to you in confidence, they declare that the ruling purpose is to escape from the "slaughter-pens" of the South. Political persecution, and not the extortion they suffer, is the refrain of all the speakers at negro meetings that are held in encouragement and aid of the emigration. It is idle to deny that the varied injustice which the negroes have suffered as voters is accountable for a large part of their universal yearning for new homes, and it will be folly for the responsible classes at the South to ignore this fact.

As it is the negroes who are fleeing from the South, it is natural to look among the dominant class for the injustice which is driving them away; but it would be unfair to conclude that the blame rests entirely upon the whites, and still more so to leave the impression that there is no extenuation for the mistakes and abuses for which the whites are responsible. Much of the intimidation of the blacks has been tolerated, if not suggested, by a fear of negro uprisings. The apprehension is a legacy from the days of slavery, and is more unreasonable now than it was then; but still it exists. This is not an excuse, but an explanation. The Pharaohs of the time of Moses were in constant dread lest the Hebrews under their rule should go over to their enemies, and their dread doubtless increased the cruelty of the Egyptians; but, while this dread was an extenuation in the eyes of the persecutors, it did not prevent the Hebrews from fleeing the persecution. So the blacks are going without regard to the justification which the whites may set up for their treatment; the only difference between the old and new exodus is that, as the writer heard one negro speaker express it, "every black man is his own Moses in this exodus." The negro may be lazy; it seems impossible to be otherwise in the Southern climate. He may not be willing to work on Saturdays, no matter how urgent the necessity; the indulgence in holidays is said to be one of the chief drawbacks to the advancement of the emancipated serfs of Russia. The blacks are certainly extravagant in their way, though the word seems to be almost misused in connection with a race who live largely on pork and molasses, and rarely wear more than half a dollar's worth of clothes at one time. They have not the instinct of home as it prevails among the whites, but incline to a crude and unsystematic communism; the negro quarters of the old plantations are all huddled together in the centre, and, except where the land owners have interfered to encourage a different life, there is still too much promiscuousness in the relation of the sexes. The negro, as a rule, has no ambition to become a land owner; he prefers to invest his surplus money, when he has any, in personal and movable property. In most cases where the blacks have been given the opportunity of buying land on long time, and paying yearly installments out of the proceeds of their annual crops, they have tired of the bargain after a year or two, and abandoned the contract. The negro politicians and preachers are not all that reformers and moralists would have them; the imitative faculty of the African has betrayed the black politician into many of the vicious ways of the white politician, and the colored preacher is frequently not above "the pomps and vanity of this wicked world." All this is the more unfortunate, as the blacks have a child-like confidence in their chosen leaders, founded partly on their primitive character, and partly on their distrust of the native whites. Both their politicians and their preachers have given abundant evidence of their insincerity during the excitement of emigration by blowing hot and blowing cold; by talking to the negroes one way, and to the whites another; and even to the extent, in some instances, of taking money to use their influence for discouraging and impeding emigration. These are some of the faults and misfortunes on the part of the blacks which enter into the race troubles. The chief blame which attaches to the whites is the failure to make a persistent effort, by education and kind treatment, to overcome the distrust and cure the faults of the negroes. The whites control, because they constitute the "property and intelligence" of the South, to use the words of a democratic statesman; this power should have been used to gain the confidence of the blacks. Had such a course been taken, there would not have been the fear of reenslavement, which actually prevails to a considerable extent among the negroes. So long as a portion of the whites entertain the conviction that the war of the sections will be renewed within a few years, as is the case, the negroes will suspect and dread the class who would treat them as enemies in case the war should come, and will seek to escape to a section of the country where they would not be so treated. Perhaps, too, there would have been a voluntary political division among the black voters, had the whites used more pacific means to bring it about, and had they themselves set the example. And last, but not least, in making up the sum of blame that the whites must bear, is their own unwillingness to labor, which gives the rural population too much time for mischief and too little sympathy with the working classes.

As we have traced the causes that have led to the exodus, and described the conditions which warrant the belief that there will be a renewal of the emigration on a more extended scale next spring, and endeavored to distribute the responsibility for the troubles equitably among whites and blacks, remedies have naturally suggested themselves to the reader; in fact, they are more easily to be thought out than accomplished. A few general reflections may be added, however, in order to indicate the probable solution of the race troubles that have brought about the exodus, if, indeed, the whites and blacks of the South are ever going to live together in peace.

(1.) It is certain that negro labor is the best the South can have, and equally certain that the climate and natural conditions of the South are better suited to the negro than any others on this continent. The alluvial lands, which many persons believe the negroes

alone can cultivate, on account of climatic conditions, are so rich that it might literally be said it is only necessary to tickle them with a hoe to make them laugh back a harvest. The common prosperity of the country--the agricultural interests of the South and the commercial interests of the North--will be best served, therefore, by the continued residence and labor of the blacks in the cotton States.

(2.) The fact stated in the foregoing paragraph is so well understood at the North that the Southern people should dismiss the idea that there is any scheming among the Northern people, political or otherwise, to draw the black labor away from its natural home. The same fact should also influence the people at the North not to be misled by any professional philanthropists who may have some self-interest in soliciting aid to facilitate negro emigration from the South. The duty of the North in this matter is simply to extend protection and assure safe-conduct to the negroes, if the Southern whites attempt to impede voluntary emigration by either law or violence. Any other course might be cruel to the negro in encouraging him to enter on a new life in a strange climate, as well as an injustice to the white land owners of the South.

(3.) There is danger that the Southern whites will, as a rule, misinterpret the meaning of the exodus. Many are inclined to underrate its importance, and those who appreciate its significance are apt to look for temporary and superficial remedies. The vague promises made at the Vicksburg convention, which was controlled by the whites, and called to consider the emigration movement, have had no influence with the negroes, because they have heard such promises before. Had the convention adopted some definite plan of action, such as ex-Governor Foote, of Mississippi, submitted, its session might not have been in vain. This plan was to establish a committee in every county, composed of men who have the confidence of both whites and blacks, that should be auxiliary to the public authorities, listen to complaints, and arbitrate, advise, conciliate, or prosecute, as each case should demand. It is short-sighted for the Southern people to make mere temporary concessions, such as have been made in some cases this year, for that course would establish an annual strike. It is folly for them to suppose they can stem the tide of emigration by influencing the regular lines of steamboats not to carry the refugees, for the people of the North will see that the blacks shall not be detained in the South against their will. It is unwise for them to devise schemes for importing Chinese, or encouraging the immigration of white labor as a substitute for negro labor, when they may much better bestir themselves to make the present effective labor content.

(4.) Education will be the most useful agent to employ in the permanent harmonizing of the two races, and the redemption of both from the faults and follies which constitute their troubles. It is not the education of the negro alone, whose ambition for learning is increasing notably with every new generation, but the education of the mass of the young whites, that is needed to inculcate more tolerance of color and opinion, to give them an aspiration beyond that of riding a horse and hanging a "nigger," and to enable them to set a better example to the imitative blacks in the way of work and frugality. The blacks need the education to protect them from designing white men; the whites need it to teach them that their own interests will be best served by abandoning bulldozing of all kinds.

(5.) Reform in the land tenure, by converting the plantation monopolies into small holdings; abolition of the credit system, by abandoning the laws which sustain it; a diversification of crops; and attention to new manufacturing, maritime, and commercial enterprises,--these are the material changes that are most needed. They can be secured only through the active and earnest efforts of the whites. The blacks will be found responsive.

(6.) The hope of the negro exodus at its present stage, or even if it shall continue another season, is that the actual loss of the valuable labor that has gone, and the prospective loss of more labor that is anxious to go, will induce the intelligent and responsible classes at the South to overcome their own prejudices, and to compel the extremists, irreconcilables, and politicians generally, of all parties, to abandon agitation, and give the South equal peace and equal chance for black and white.

MY ESCAPE FROM SLAVERY by Frederick Douglass

In the first narrative of my experience in slavery, written nearly forty years ago, and in various writings since, I have given the public what I considered very good reasons for withholding the manner of my escape. In substance these reasons were, first, that such publication at any time during the existence of slavery might be used by the master against the slave, and prevent the future escape of any who might adopt the same means that I did. The second reason was, if possible, still more binding to silence: the publication of details would certainly have put in peril the persons and property of those who assisted. Murder itself was not more sternly and certainly punished in the State of Maryland than that of aiding and abetting the escape of a slave. Many colored men, for no other crime than that of giving aid to a fugitive slave, have, like Charles T. Torrey, perished in prison. The abolition of slavery in my native State and throughout the country, and the lapse of time, render the caution hitherto observed no longer necessary. But

even since the abolition of slavery, I have sometimes thought it well enough to baffle curiosity by saying that while slavery existed there were good reasons for not telling the manner of my escape, and since slavery had ceased to exist, there was no reason for telling it. I shall now, however, cease to avail myself of this formula, and, as far as I can, endeavor to satisfy this very natural curiosity. I should, perhaps, have yielded to that feeling sooner, had there been anything very heroic or thrilling in the incidents connected with my escape, for I am sorry to say I have nothing of that sort to tell; and yet the courage that could risk betrayal and the bravery which was ready to encounter death, if need be, in pursuit of freedom, were essential features in the undertaking. My success was due to address rather than courage, to good luck rather than bravery. My means of escape were provided for me by the very men who were making laws to hold and bind me more securely in slavery.

It was the custom in the State of Maryland to require the free colored people to have what were called free papers. These instruments they were required to renew very often, and by charging a fee for this writing, considerable sums from time to time were collected by the State. In these papers the name, age, color, height, and form of the freeman were described, together with any scars or other marks upon his person which could assist in his identification. This device in some measure defeated itself--since more than one man could be found to answer the same general description. Hence many slaves could escape by personating the owner of one set of papers; and this was often done as follows: A slave, nearly or sufficiently answering the description set forth in the papers, would borrow or hire them till by means of them he could escape to a free State, and then, by mail or otherwise, would return them to the owner. The operation was a hazardous one for the lender as well as for the borrower. A failure on the part of the fugitive to send back the papers would imperil his benefactor, and the discovery of the papers in possession of the wrong man would imperil both the fugitive and his friend. It was, therefore, an act of supreme trust on the part of a freeman of color thus to put in jeopardy his own liberty that another might be free. It was, however, not unfrequently bravely done, and was seldom discovered. I was not so fortunate as to resemble any of my free acquaintances sufficiently to answer the description of their papers. But I had a friend--a sailor--who owned a sailor's protection, which answered somewhat the purpose of free papers--describing his person, and certifying to the fact that he was a free American sailor. The instrument had at its head the American eagle, which gave it the appearance at once of an authorized document. This protection, when in my hands, did not describe its bearer very accurately. Indeed, it called for a man much darker than myself, and close examination of it would have caused my arrest at the start.

In order to avoid this fatal scrutiny on the part of railroad officials, I arranged with Isaac Rolls, a Baltimore hackman, to bring my baggage to the Philadelphia train just on the moment of starting, and jumped upon the car myself when the train was in motion. Had I gone into the station and offered to purchase a ticket, I should have been instantly and carefully examined, and undoubtedly arrested. In choosing this plan I considered the jostle of the train, and the natural haste of the conductor, in a train crowded with passengers, and relied upon my skill and address in playing the sailor, as described in my protection, to do the rest. One element in my favor was the kind feeling which prevailed in Baltimore and other sea-ports at the time, toward "those who go down to the sea in ships." "Free trade and sailors' rights" just then expressed the sentiment of the country. In my clothing I was rigged out in sailor style. I had on a red shirt and a tarpaulin hat, and a black cravat tied in sailor fashion carelessly and loosely about my neck. My knowledge of ships and sailor's talk came much to my assistance, for I knew a ship from stem to stern, and from keelson to cross-trees, and could talk sailor like an "old salt." I was well on the way to Havre de Grace before the conductor came into the negro car to collect tickets and examine the papers of his black passengers. This was a critical moment in the drama. My whole future depended upon the decision of this conductor. Agitated though I was while this ceremony was proceeding, still, externally, at least, I was apparently calm and self-possessed. He went on with his duty--examining several colored passengers before reaching me. He was somewhat harsh in tome and peremptory in manner until he reached me, when, strange enough, and to my surprise and relief, his whole manner changed. Seeing that I did not readily produce my free papers, as the other colored persons in the car had done, he said to me, in friendly contrast with his bearing toward the others:

"I suppose you have your free papers?"

To which I answered:

"No sir; I never carry my free papers to sea with me."

"But you have something to show that you are a freeman, haven't you?"

"Yes, sir," I answered; "I have a paper with the American Eagle on it, and that will carry me around the world."

With this I drew from my deep sailor's pocket my seaman's protection, as before described. The merest glance at the paper satisfied him, and he took my fare and went on about his business. This moment of time was one of the most anxious I ever experienced. Had the conductor looked closely at the paper, he could not have failed to discover that it called for a very different-looking person from myself, and in that case it would have been his duty to arrest me on the instant, and send me back to Baltimore from the first station. When he left me with the assurance that I was all right, though much relieved, I realized that I was still in great danger: I was still in Maryland, and subject to arrest at any moment. I saw on the train several persons who would have known me in any other clothes, and I feared they might recognize me, even in my sailor "rig," and report me to the conductor, who would then subject me to a closer examination, which I knew well would be fatal to me.

Though I was not a murderer fleeing from justice, I felt perhaps quite as miserable as such a criminal. The train was moving at a very high rate of speed for that epoch of railroad travel, but to my anxious mind it was moving far too slowly. Minutes were hours, and hours were days during this part of my flight. After Maryland, I was to pass through Delaware--another slave State, where slave-catchers generally awaited their prey, for it was not in the interior of the State, but on its borders, that these human hounds were most vigilant and active. The border lines between slavery and freedom were the dangerous ones for the fugitives. The heart of no fox or deer, with hungry hounds on his trail in full chase, could have beaten more anxiously or noisily than did mine from the time I left Baltimore till I reached Philadelphia. The passage of the Susquehanna River at Havre de Grace was at that time made by ferry-boat, on board of which I met a young colored man by the name of Nichols, who came very near betraying me. He was a "hand" on the boat, but, instead of minding his business, he insisted upon knowing me, and asking me dangerous questions as to where I was going, when I was coming back, etc. I got away from my old and inconvenient acquaintance as soon as I could decently do so, and went to another part of the boat. Once across the river, I encountered a new danger. Only a few days before, I had been at work on a revenue cutter, in Mr. Price's ship-yard in Baltimore, under the care of Captain McGowan. On the meeting at this point of the two trains, the one going south stopped on the track just opposite to the one going north, and it so happened that this Captain McGowan sat at a window where he could see me very distinctly, and would certainly have recognized me had he looked at me but for a second. Fortunately, in the hurry of the moment, he did not see me; and the trains soon passed each other on their respective ways. But this was not my only hair-breadth escape. A German blacksmith whom I knew well was on the train with me, and looked at me very intently, as if he thought he had seen me somewhere before in his travels. I really believe he knew me, but had no heart to betray me. At any rate, he saw me escaping and held his peace.

The last point of imminent danger, and the one I dreaded most, was Wilmington. Here we left the train and took the steam-boat for Philadelphia. In making the change here I again apprehended arrest, but no one disturbed me, and I was soon on the broad and beautiful Delaware, speeding away to the Quaker City. On reaching Philadelphia in the afternoon, I inquired of a colored man how I could get on to New York. He directed me to the William-street depot, and thither I went, taking the train that night. I reached New York Tuesday morning, having completed the journey in less than twenty-four hours.

My free life began on the third of September, 1838. On the morning of the fourth of that month, after an anxious and most perilous but safe journey, I found myself in the big city of New York, a FREE MAN--one more added to the mighty throng which, like the confused waves of the troubled sea, surged to and fro between the lofty walls of Broadway. Though dazzled with the wonders which met me on every hand, my thoughts could not be much withdrawn from my strange situation. For the moment, the dreams of my youth and the hopes of my manhood were completely fulfilled. The bonds that had held me to "old master" were broken. No man now had a right to call me his slave or assert mastery over me. I was in the rough and tumble of an outdoor world, to take my chance with the rest of its busy number. I have often been asked how I felt when first I found myself on free soil. There is scarcely anything in my experience about which I could not give a more satisfactory answer. A new world had opened upon me. If life is more than breath and the "quick round of blood," I lived more in that one day than in a year of my slave life. It was a time of joyous excitement which words can but tamely describe. In a letter written to a friend soon after reaching New York, I said: "I felt as one might feel upon escape from a den of hungry lions." Anguish and grief, like darkness and rain, may be depicted; but gladness and joy, like the rainbow, defy the skill of pen or pencil. During ten or fifteen years I had been, as it were, dragging a heavy chain which no strength of mine could break; I was not only a slave, but a slave for life. I might become a husband, a father, an aged man, but through all, from birth to death, from the cradle to the grave, I had felt myself doomed. All efforts I had previously made to secure my freedom had not only failed, but had seemed only to rivet my fetters the more firmly, and to render my escape more difficult. Baffled, entangled, and discouraged, I had at times asked myself the question, May not my condition after all be God's work, and ordered for a wise purpose, and if so, Is not submission my duty? A contest had in fact been going on in my mind for a long time, between the clear consciousness of right and the plausible make-shifts of theology and superstition. The one held me an abject slave--a prisoner for life, punished for some transgression in which I had no lot nor part; and the other counseled me to manly

endeavor to secure my freedom. This contest was now ended; my chains were broken, and the victory brought me unspeakable joy.

But my gladness was short-lived, for I was not yet out of the reach and power of the slave-holders. I soon found that New York was not quite so free or so safe a refuge as I had supposed, and a sense of loneliness and insecurity again oppressed me most sadly. I chanced to meet on the street, a few hours after my landing, a fugitive slave whom I had once known well in slavery. The information received from him alarmed me. The fugitive in question was known in Baltimore as "Allender's Jake," but in New York he wore the more respectable name of "William Dixon." Jake, in law, was the property of Doctor Allender, and Tolly Allender, the son of the doctor, had once made an effort to recapture MR. DIXON, but had failed for want of evidence to support his claim. Jake told me the circumstances of this attempt, and how narrowly he escaped being sent back to slavery and torture. He told me that New York was then full of Southerners returning from the Northern watering-places; that the colored people of New York were not to be trusted; that there were hired men of my own color who would betray me for a few dollars; that there were hired men ever on the lookout for fugitives; that I must trust no man with my secret; that I must not think of going either upon the wharves or into any colored boarding-house, for all such places were closely watched; that he was himself unable to help me; and, in fact, he seemed while speaking to me to fear lest I myself might be a spy and a betrayer. Under this apprehension, as I suppose, he showed signs of wishing to be rid of me, and with whitewash brush in hand, in search of work, he soon disappeared.

This picture, given by poor "Jake," of New York, was a damper to my enthusiasm. My little store of money would soon be exhausted, and since it would be unsafe for me to go on the wharves for work, and I had no introductions elsewhere, the prospect for me was far from cheerful. I saw the wisdom of keeping away from the ship-yards, for, if pursued, as I felt certain I should be, Mr. Auld, my "master," would naturally seek me there among the calkers. Every door seemed closed against me. I was in the midst of an ocean of my fellow-men, and yet a perfect stranger to every one. I was without home, without acquaintance, without money, without credit, without work, and without any definite knowledge as to what course to take, or where to look for succor. In such an extremity, a man had something besides his new-born freedom to think of. While wandering about the streets of New York, and lodging at least one night among the barrels on one of the wharves, I was indeed free--from slavery, but free from food and shelter as well. I kept my secret to myself as long as I could, but I was compelled at last to seek some one who would befriend me without taking advantage of my destitution to betray me. Such a person I found in a sailor named Stuart, a warm-hearted and generous fellow, who, from his humble home on Centre street, saw me standing on the opposite sidewalk, near the Tombs prison. As he approached me, I ventured a remark to him which at once enlisted his interest in me. He took me to his home to spend the night, and in the morning went with me to Mr. David Ruggles, the secretary of the New York Vigilance Committee, a co-worker with Isaac T. Hopper, Lewis and Arthur Tappan, Theodore S. Wright, Samuel Cornish, Thomas Downing, Philip A. Bell, and other true men of their time. All these (save Mr. Bell, who still lives, and is editor and publisher of a paper called the "Elevator," in San Francisco) have finished their work on earth. Once in the hands of these brave and wise men, I felt comparatively safe. With Mr. Ruggles, on the corner of Lispenard and Church streets, I was hidden several days, during which time my intended wife came on from Baltimore at my call, to share the burdens of life with me. She was a free woman, and came at once on getting the good news of my safety. We were married by Rev. J. W. C. Pennington, then a well-known and respected Presbyterian minister. I had no money with which to pay the marriage fee, but he seemed well pleased with our thanks.

Mr. Ruggles was the first officer on the "Underground Railroad" whom I met after coming North, and was, indeed, the only one with whom I had anything to do till I became such an officer myself. Learning that my trade was that of a calker, he promptly decided that the best place for me was in New Bedford, Mass. He told me that many ships for whaling voyages were fitted out there, and that I might there find work at my trade and make a good living. So, on the day of the marriage ceremony, we took our little luggage to the steamer JOHN W. RICHMOND, which, at that time, was one of the line running between New York and Newport, R. I. Forty-three years ago colored travelers were not permitted in the cabin, nor allowed abaft the paddle-wheels of a steam vessel. They were compelled, whatever the weather might be,--whether cold or hot, wet or dry,--to spend the night on deck. Unjust as this regulation was, it did not trouble us much; we had fared much harder before. We arrived at Newport the next morning, and soon after an old fashioned stage-coach, with "New Bedford" in large yellow letters on its sides, came down to the wharf. I had not money enough to pay our fare, and stood hesitating what to do. Fortunately for us, there were two Quaker gentlemen who were about to take passage on the stage,--Friends William C. Taber and Joseph Ricketson,--who at once discerned our true situation, and, in a peculiarly quiet way, addressing me, Mr. Taber said: "Thee get in." I never obeyed an order with more alacrity, and we were soon on our way to our new home. When we reached "Stone Bridge" the passengers alighted for breakfast, and paid their fares to the driver. We took no breakfast, and, when asked for our fares, I told the driver I would make it right with him when we reached New Bedford. I expected some objection to this on his part, but he made none. When, however, we reached New Bedford,

he took our baggage, including three music-books,--two of them collections by Dyer, and one by Shaw,--and held them until I was able to redeem them by paying to him the amount due for our rides. This was soon done, for Mr. Nathan Johnson not only received me kindly and hospitably, but, on being informed about our baggage, at once loaned me the two dollars with which to square accounts with the stage-driver. Mr. and Mrs. Nathan Johnson reached a good old age, and now rest from their labors. I am under many grateful obligations to them. They not only "took me in when a stranger" and "fed me when hungry," but taught me how to make an honest living. Thus, in a fortnight after my flight from Maryland, I was safe in New Bedford, a citizen of the grand old commonwealth of Massachusetts.

Once initiated into my new life of freedom and assured by Mr. Johnson that I need not fear recapture in that city, a comparatively unimportant question arose as to the name by which I should be known thereafter in my new relation as a free man. The name given me by my dear mother was no less pretentious and long than Frederick Augustus Washington Bailey. I had, however, while living in Maryland, dispensed with the Augustus Washington, and retained only Frederick Bailey. Between Baltimore and New Bedford, the better to conceal myself from the slave-hunters, I had parted with Bailey and called myself Johnson; but in New Bedford I found that the Johnson family was already so numerous as to cause some confusion in distinguishing them, hence a change in this name seemed desirable. Nathan Johnson, mine host, placed great emphasis upon this necessity, and wished me to allow him to select a name for me. I consented, and he called me by my present name--the one by which I have been known for three and forty years--Frederick Douglass. Mr. Johnson had just been reading the "Lady of the Lake," and so pleased was he with its great character that he wished me to bear his name. Since reading that charming poem myself, I have often thought that, considering the noble hospitality and manly character of Nathan Johnson--black man though he was--he, far more than I, illustrated the virtues of the Douglas of Scotland. Sure am I that, if any slave-catcher had entered his domicile with a view to my recapture, Johnson would have shown himself like him of the "stalwart hand."

The reader may be surprised at the impressions I had in some way conceived of the social and material condition of the people at the North. I had no proper idea of the wealth, refinement, enterprise, and high civilization of this section of the country. My "Columbian Orator," almost my only book, had done nothing to enlighten me concerning Northern society. I had been taught that slavery was the bottom fact of all wealth. With this foundation idea, I came naturally to the conclusion that poverty must be the general condition of the people of the free States. In the country from which I came, a white man holding no slaves was usually an ignorant and poverty-stricken man, and men of this class were contemptuously called "poor white trash." Hence I supposed that, since the non-slave-holders at the South were ignorant, poor, and degraded as a class, the non-slave-holders at the North must be in a similar condition. I could have landed in no part of the United States where I should have found a more striking and gratifying contrast, not only to life generally in the South, but in the condition of the colored people there, than in New Bedford. I was amazed when Mr. Johnson told me that there was nothing in the laws or constitution of Massachusetts that would prevent a colored man from being governor of the State, if the people should see fit to elect him. There, too, the black man's children attended the public schools with the white man's children, and apparently without objection from any quarter. To impress me with my security from recapture and return to slavery, Mr. Johnson assured me that no slave-holder could take a slave out of New Bedford; that there were men there who would lay down their lives to save me from such a fate.

The fifth day after my arrival, I put on the clothes of a common laborer, and went upon the wharves in search of work. On my way down Union street I saw a large pile of coal in front of the house of Rev. Ephraim Peabody, the Unitarian minister. I went to the kitchen door and asked the privilege of bringing in and putting away this coal. "What will you charge?" said the lady. "I will leave that to you, madam." "You may put it away," she said. I was not long in accomplishing the job, when the dear lady put into my hand TWO SILVER HALF-DOLLARS. To understand the emotion which swelled my heart as I clasped this money, realizing that I had no master who could take it from me,--THAT IT WAS MINE--THAT MY HANDS WERE MY OWN, and could earn more of the precious coin,--one must have been in some sense himself a slave. My next job was stowing a sloop at Uncle Gid. Howland's wharf with a cargo of oil for New York. I was not only a freeman, but a free working-man, and no "master" stood ready at the end of the week to seize my hard earnings.

The season was growing late and work was plenty. Ships were being fitted out for whaling, and much wood was used in storing them. The sawing this wood was considered a good job. With the help of old Friend Johnson (blessings on his memory) I got a saw and "buck," and went at it. When I went into a store to buy a cord with which to brace up my saw in the frame, I asked for a "fip's" worth of cord. The man behind the counter looked rather sharply at me, and said with equal sharpness, "You don't belong about here." I was alarmed, and thought I had betrayed myself. A fip in Maryland was six and a quarter cents, called fourpence in Massachusetts. But no harm came from the "fi'penny-bit" blunder, and I confidently and cheerfully went to work with my saw and

buck. It was new business to me, but I never did better work, or more of it, in the same space of time on the plantation for Covey, the negro-breaker, than I did for myself in these earliest years of my freedom.

Notwithstanding the just and humane sentiment of New Bedford three and forty years ago, the place was not entirely free from race and color prejudice. The good influence of the Roaches, Rodmans, Arnolds, Grinnells, and Robesons did not pervade all classes of its people. The test of the real civilization of the community came when I applied for work at my trade, and then my repulse was emphatic and decisive. It so happened that Mr. Rodney French, a wealthy and enterprising citizen, distinguished as an anti-slavery man, was fitting out a vessel for a whaling voyage, upon which there was a heavy job of calking and coppering to be done. I had some skill in both branches, and applied to Mr. French for work. He, generous man that he was, told me he would employ me, and I might go at once to the vessel. I obeyed him, but upon reaching the float-stage, where others [sic] calkers were at work, I was told that every white man would leave the ship, in her unfinished condition, if I struck a blow at my trade upon her. This uncivil, inhuman, and selfish treatment was not so shocking and scandalous in my eyes at the time as it now appears to me. Slavery had inured me to hardships that made ordinary trouble sit lightly upon me. Could I have worked at my trade I could have earned two dollars a day, but as a common laborer I received but one dollar. The difference was of great importance to me, but if I could not get two dollars, I was glad to get one; and so I went to work for Mr. French as a common laborer. The consciousness that I was free--no longer a slave--kept me cheerful under this, and many similar proscriptions, which I was destined to meet in New Bedford and elsewhere on the free soil of Massachusetts. For instance, though colored children attended the schools, and were treated kindly by their teachers, the New Bedford Lyceum refused, till several years after my residence in that city, to allow any colored person to attend the lectures delivered in its hall. Not until such men as Charles Sumner, Theodore Parker, Ralph Waldo Emerson, and Horace Mann refused to lecture in their course while there was such a restriction, was it abandoned.

Becoming satisfied that I could not rely on my trade in New Bedford to give me a living, I prepared myself to do any kind of work that came to hand. I sawed wood, shoveled coal, dug cellars, moved rubbish from back yards, worked on the wharves, loaded and unloaded vessels, and scoured their cabins.

I afterward got steady work at the brass-foundry owned by Mr. Richmond. My duty here was to blow the bellows, swing the crane, and empty the flasks in which castings were made; and at times this was hot and heavy work. The articles produced here were mostly for ship work, and in the busy season the foundry was in operation night and day. I have often worked two nights and every working day of the week. My foreman, Mr. Cobb, was a good man, and more than once protected me from abuse that one or more of the hands was disposed to throw upon me. While in this situation I had little time for mental improvement. Hard work, night and day, over a furnace hot enough to keep the metal running like water, was more favorable to action than thought; yet here I often nailed a newspaper to the post near my bellows, and read while I was performing the up and down motion of the heavy beam by which the bellows was inflated and discharged. It was the pursuit of knowledge under difficulties, and I look back to it now, after so many years, with some complacency and a little wonder that I could have been so earnest and persevering in any pursuit other than for my daily bread. I certainly saw nothing in the conduct of those around to inspire me with such interest: they were all devoted exclusively to what their hands found to do. I am glad to be able to say that, during my engagement in this foundry, no complaint was ever made against me that I did not do my work, and do it well. The bellows which I worked by main strength was, after I left, moved by a steam-engine.

THE GOOPHERED GRAPEVINE by Charles W. Chesnutt

About ten years ago my wife was in poor health, and our family doctor, in whose skill and honesty I had implicit confidence, advised a change of climate. I was engaged in grape-culture in northern Ohio, and decided to look for a locality suitable for carrying on the same business in some Southern State. I wrote to a cousin who had gone into the turpentine business in central North Carolina, and he assured me that no better place could be found in the South than the State and neighborhood in which he lived: climate and soil were all that could be asked for, and land could be bought for a mere song. A cordial invitation to visit him while I looked into the matter was accepted. We found the weather delightful at that season, the end of the summer, and were most hospitably entertained. Our host placed a horse and buggy at our disposal, and himself acted as guide until I got somewhat familiar with the country.

I went several times to look at a place which I thought might suit me. It had been at one time a thriving plantation, but shiftless cultivation had well-night exhausted the soil. There had been a vineyard of some extent on the place, but it had not been attended to since the war, and had fallen into utter neglect. The vines--here partly supported by decayed and broken-down arbors, there

twining themselves among the branches of the slender saplings which had sprung up among them--grew in wild and unpruned luxuriance, and the few scanty grapes which they bore were the undisputed prey of the first comer. The site was admirably adapted to grape-raising; the soil, with a little attention, could not have been better; and with the native grape, the luscious scuppernong, mainly to rely upon, I felt sure that I could introduce and cultivate successfully a number of other varieties.

One day I went over with my wife, to show her the place. We drove between the decayed gate-posts--the gate itself had long since disappeared--and up the straight, sandy lane to the open space where a dwelling-house had once stood. But the house had fallen a victim to the fortunes of war, and nothing remained of it except the brick pillars upon which the sills had rested. We alighted, and walked about the place for a while; but on Annie's complaining of weariness I led the way back to the yard, where a pine log, lying under a spreading elm, formed a shady though somewhat hard seat. One end of the log was already occupied by a venerable-looking colored man. He held on his knees a hat full of grapes, over which he was smacking his lips with great gusto, and a pile of grape-skins near him indicated that the performance was no new thing. He respectfully rose as we approached, and was moving away, when I begged him to keep his seat.

"Don't let us disturb you," I said. "There's plenty of room for us all."

He resumed his seat with somewhat of embarrassment.

"Do you live around here?" I asked, anxious to put him at his ease.

"Yas, suh. I lives des ober yander, behine de nex' san'-hill, on de Lumberton plank-road."

"Do you know anything about the time when this vineyard was cultivated?"

"Lawd bless yer, suh, I knows all about it. Dey ain' na'er a man in dis settlement w'at won' tell yer ole Julius McAdoo 'uz bawn an' raise' on dis yer same plantation. Is you de Norv'n gemman w'at's gwine ter buy de ole vimya'd?"

"I am looking at it," I replied; "but I don't know that I shall care to buy unless I can be reasonably sure of making something out of it."

"Well, suh, you is a stranger ter me, en I is a stranger ter you, en we is bofe strangers ter one anudder, but 'f I 'uz in yo' place, I wouldn' buy dis vimya'd."

"Why not?" I asked.

"Well, I dunner whe'r you b'lieves in cunj'in er not,--some er de w'ite folks don't, er says dey don't,--but de truf er de matter is dat dis yer ole vimya'd is goophered."

"Is what?" I asked, not grasping the meaning of this unfamiliar word.

"Is goophered, cunju'd, bewitch'."

He imparted this information with such solemn earnestness, and with such an air of confidential mystery, that I felt somewhat interested, while Annie was evidently much impressed, and drew closer to me.

"How do you know it is bewitched?" I asked.

"I wouldn' spec' fer you ter b'lieve me 'less you know all 'bout de fac's. But ef you en young miss dere doan' min' lis'n'in' ter a ole nigger run on a minute er two w'ile you er restin', I kin 'splain to yer how it all happen'."

We assured him that we would be glad to hear how it all happened, and he began to tell us. At first the current of his memory--or imagination--seemed somewhat sluggish; but as his embarrassment wore off, his language flowed more freely, and the story acquired perspective and coherence. As he became more and more absorbed in the narrative, his eyes assumed a dreamy expression, and he seemed to lose sight of his auditors, and to be living over again in monologue his life on the old plantation.

"Ole Mars Dugal' McAdoo bought dis place long many years befo' de wah, en I 'member well w'en he sot out all dis yer part er de plantation in scuppernon's. De vimes growed monst'us fas', en Mars Dugal' made a thousan' gallon er scuppernon' wine eve'y year.

"Now, ef dey's an'thing a nigger lub, nex' ter 'possum, en chick'n, en watermillyums, it's scuppernon's. Dey ain' nuffin dat kin stan' up side'n de scuppernon' fer sweetness; sugar ain't a suckumstance ter scuppernon'. W'en de season is nigh 'bout ober, en de grapes begin ter swivel up des a little wid de wrinkles er ole age,--w'en de skin git sof' en brown,--den de scuppernon' make you

smack yo' lip en roll yo' eye en wush fer mo'; so I reckon it ain' very 'stonishin' dat niggers lub scuppernon'.

"Dey wuz a sight er niggers in de naberhood er de vimya'd. Dere wuz ole Mars Henry Brayboy's niggers, en ole Mars Dunkin McLean's niggers, en Mars Dugal's own niggers; den dey wuz a settlement er free niggers en po' buckrahs down by de Wim'l'ton Road, en Mars Dugal' had de only vimya'd in de naberhood. I reckon it ain' so much so nowadays, but befo' de wah, in slab'ry times, er nigger didn' mine goin' fi' er ten mile in a night, w'en dey wuz sump'n good ter eat at de yuther een.

"So atter a w'ile Mars Dugal' begin ter miss his scuppernon's. Co'se he 'cuse' de niggers er it, but dey all 'nied it ter de las'. Mars Dugal' sot spring guns en steel traps, en he en de oberseah sot up nights once't er twice't, tel one night Mars Dugal'--he 'uz a monst'us keerless man--got his leg shot full er cow-peas. But somehow er nudder dey couldn' nebber ketch none er de niggers. I dunner how it happen, but it happen des like I tell yer, en de grapes kep' on a-goin des de same.

"But bimeby ole Mars Dugal' fix' up a plan ter stop it. Dey 'uz a cunjuh 'ooman livin' down mongs' de free niggers on de Wim'l'ton Road, en all de darkies fum Rockfish ter Beaver Crick wuz feared uv her. She could wuk de mos' powerfulles' kind er goopher,--could make people hab fits er rheumatiz, er make 'em des dwinel away en die; en dey say she went out ridin' de niggers at night, for she wuz a witch 'sides bein' a cunjuh 'ooman. Mars Dugal' hearn 'bout Aun' Peggy's doin's, en begun ter 'flect whe'r er no he couldn' git her ter he'p him keep de niggers off'n de grapevimes. One day in de spring er de year, ole miss pack' up a basket er chick'n en poun'-cake, en a bottle er scuppernon' wine, en Mars Dugal' tuk it in his buggy en driv ober ter Aun' Peggy's cabin. He tuk de basket in, en had a long talk wid Aun' Peggy. De nex' day Aun' Peggy come up ter de vimya'd. De niggers seed her slippin' 'roun', en dey soon foun' out what she 'uz doin' dere. Mars Dugal' had hi'ed her ter goopher de grapevimes. She sa'ntered 'roun' mongs' de vimes, en tuk a leaf fum dis one, en a grape-hull fum dat one, en a grape-seed fum anudder one; en den a little twig fum here, en a little pinch er dirt fum dere,--en put it all in a big black bottle, wid a snake's toof en a speckle' hen's gall en some ha'rs fum a black cat's tail, en den fill' de bottle wid scuppernon' wine. W'en she got de goopher all ready en fix', she tuk 'n went out in de woods en buried it under de root uv a red oak tree, en den come back en tole one er de niggers she done goopher de grapevimes, en a'er a nigger w'at eat dem grapes 'ud be sho ter die inside'n twel' mont's.

"Atter dat de niggers let de scuppernon's 'lone, en Mars Dugal' didn' hab no 'casion ter fine no mo' fault; en de season wuz mos' gone, w'en a strange gemman stop at de plantation one night ter see Mars Dugal' on some business; en his coachman, seein' de scuppernon's growin' so nice en sweet, slip 'roun' behine de smoke-house, en et all de scuppernon's he could hole. Nobody didn' notice it at de time, but dat night, on de way home, de gemman's hoss runned away en kill' de coachman. W'en we hearn de noos, Aun' Lucy, de cook, she up 'n say she seed de strange nigger eat'n' er de scuppernon's behine de smoke-house; en den we knowed de goopher had b'en er wukkin. Den one er de nigger chilluns runned away fum de quarters one day, en got in de scuppernon's, en died de nex' week. W'ite folks say he die' er de fevuh, but de niggers knowed it wuz de goopher. So you k'n be sho de darkies didn' hab much ter do wid dem scuppernon' vimes.

"W'en de scuppernon' season 'uz ober fer dat year, Mars Dugal' foun' he had made fifteen hund'ed gallon er wine; en one er de niggers hearn him laffin' wid de oberseah fit ter kill, en sayin' dem fifteen hund'ed gallon er wine wuz monst'us good intrus' on de ten dollars he laid out on de vimya'd. So I 'low ez he paid Aun' Peggy ten dollars fer to goopher de grapevimes.

"De goopher didn' wuk no mo' tel de nex' summer, w'en 'long to'ds de middle er de season one er de fiel' han's died; en ez dat lef' Mars Dugal' sho't er han's, he went off ter town fer ter buy anudder. He fotch de noo nigger home wid 'im. He wuz er ole nigger, er de color er a gingy-cake, en ball ez a hoss-apple on de top er his head. He wuz a peart ole nigger, do', en could do a big day's wuk.

"Now it happen dat one er de niggers on de nex' plantation, one er ole Mars Henry Brayboy's niggers, had runned away de day befo', en tuk ter de swamp, en ole Mars Dugal' en some er de yuther nabor w'ite folks had gone out wid dere guns en dere dogs fer ter he'p 'em hunt fer de nigger; en de han's on our own plantation wuz all so flusterated dat we fuhgot ter tell de noo han' 'bout de goopher on de scuppernon' vimes. Co'se he smell de grapes en see de vimes, an atter dahk de fus' thing he done wuz ter slip off ter de grapevimes 'dout sayin' nuffin ter nobody. Nex' mawnin' he tole some er de niggers 'bout de fine bait er scuppernon' he et de night befo'.

"W'en dey tole 'im 'bout de goopher on de grapevimes, he 'uz dat tarrified dat he turn pale, en look des like he gwine ter die right in his tracks. De oberseah come up en axed w'at 'uz de matter; en w'en dey tole 'im Henry be'n eatin' er de scuppernon's, en got de goopher on 'im, he gin Henry a big drink er w'iskey, en 'low dat de nex' rainy day he take 'im ober ter Aun' Peggy's, en see ef she wouldn' take de goopher off'n him, seein' ez he didn' know nuffin erbout it tel he done et de grapes.

"Sho nuff, it rain de nex' day, en de oberseah went ober ter Aun' Peggy's wid Henry. En Aun' Peggy say dat bein' ez Henry didn' know 'bout de goopher, en et de grapes in ign'ance er de quinseconces, she reckon she mought be able fer ter take de goopher off'n him. So she fotch out er bottle wid some cunjuh medicine in it, en po'd some out in a go'd fer Henry ter drink. He manage ter git it down; he say it tas'e like whiskey wid sump'n bitter in it. She 'lowed dat 'ud keep de goopher off'n him tel de spring; but w'en de sap begin ter rise in de grapevimes he ha' ter come en see her agin, en she tell him w'at e's ter do.

"Nex' spring, w'en de sap commence' ter rise in de scuppernon' vime, Henry tuk a ham one night. Whar'd he git de ham? I doan know; dey wa'nt no hams on de plantation 'cep'n' w'at 'uz in de smoke-house, but I never see Henry 'bout de smoke-house. But ez I wuz a-sayin', he tuk de ham ober ter Aun' Peggy's; en Aun' Peggy tole 'im dat w'en Mars Dugal' begin ter prume de grapevimes, he mus' go en take 'n scrape off de sap whar it ooze out'n de cut een's er de vimes, en 'n'int his ball head wid it; en ef he do dat once't a year de goopher wouldn' wuk agin 'im long ez he done it. En bein' ez he fotch her de ham, she fix' it so he kin eat all de scuppernon' he want.

"So Henry 'n'int his head wid de sap out'n de big grapevime des ha'f way 'twix' de quarters en de big house, en de goopher nebber wuk agin him dat summer. But de beatenes' thing you eber see happen ter Henry. Up ter dat time he wuz ez ball ez a sweeten' 'tater, but des ez soon ez de young leaves begun ter come out on de grapevimes de ha'r begun ter grow out on Henry's head, en by de middle er de summer he had de bigges' head er ha'r on de plantation. Befo' dat, Henry had tol'able good ha'r 'roun de aidges, but soon ez de young grapes begun ter come Henry's ha'r begun ter quirl all up in little balls, des like dis yer reg'lar grapy ha'r, en by de time de grapes got ripe his head look des like a bunch er grapes. Combin' it didn' do no good; he wuk at it ha'f de night wid er Jim Crow [1], en think he git it straighten' out, but in de mawnin' de grapes 'ud be dere des de same. So he gin it up, en tried ter keep de grapes down by havin' his ha'r cut sho't."

[Footnote 1: A small card, resembling a curry-comb in construction, and used by negroes in the rural districts instead of a comb.]

"But dat wa'nt de quares' thing 'bout de goopher. When Henry come ter de plantation, he wuz gittin' a little ole an stiff in de j'ints. But dat summer he got des ez spry en libely ez any young nigger on de plantation; fac' he got so biggity dat Mars Jackson, de oberseah, ha' ter th'eaten ter whip 'im, ef he didn' stop cuttin' up his didos en behave hisse'f. But de mos' cur'ouses' thing happen' in de fall, when de sap begin ter go down in de grapevimes. Fus', when de grapes 'uz gethered, de knots begun ter straighten out'n Henry's h'ar; en w'en de leaves begin ter fall, Henry's ha'r begin ter drap out; en w'en de vimes 'uz b'ar, Henry's head wuz baller 'n it wuz in de spring, en he begin ter git ole en stiff in de j'ints ag'in, en paid no mo' tention ter de gals dyoin' er de whole winter. En nex' spring, w'en he rub de sap on ag'in, he got young ag'in, en so soopl en libely dat none er de young niggers on de plantation couldn' jump, ner dance, ner hoe ez much cotton ez Henry. But in de fall er de year his grapes begun ter straighten out, en his j'ints ter git stiff, en his ha'r drap off, en de rheumatiz begin ter wrastle wid 'im.

"Now, ef you'd a knowed ole Mars Dugal' McAdoo, you'd a knowed dat it ha' ter be a mighty rainy day when he couldn' fine sump'n fer his niggers ter do, en it ha' ter be a mighty little hole he couldn' crawl thoo, en ha' ter be a monst'us cloudy night w'en a dollar git by him in de dahkness; en w'en he see how Henry git young in de spring en ole in de fall, he 'lowed ter hisse'f ez how he could make mo' money outen Henry dan by wukkin' him in de cotton fiel'. 'Long de nex' spring, atter de sap commence' ter rise, en Henry 'n'int 'is head en commence fer ter git young en soopl, Mars Dugal' up 'n tuk Henry ter town, en sole 'im fer fifteen hunder' dollars. Co'se de man w'at bought Henry didn' know nuffin 'bout de goopher, en Mars Dugal' didn' see no 'casion fer ter tell 'im. Long to'ds de fall, w'en de sap went down, Henry begin ter git ole again same ez yuzhal, en his noo marster begin ter git skeered les'n he gwine ter lose his fifteen-hunder'-dollar nigger. He sent fer a mighty fine doctor, but de med'cine didn' 'pear ter do no good; de goopher had a good holt. Henry tole de doctor 'bout de goopher, but de doctor des laff at 'im.

"One day in de winter Mars Dugal' went ter town, en wuz santerin' 'long de Main Street, when who should he meet but Henry's noo marster. Dey said 'Hoddy,' en Mars Dugal' ax 'im ter hab a seegyar; en atter dey run on awhile 'bout de craps en de weather, Mars Dugal' ax 'im, sorter keerless, like ez ef he des thought of it,--

"'How you like de nigger I sole you las' spring?'

"Henry's marster shuck his head en knock de ashes off'n his seegyar.

"'Spec' I made a bad bahgin when I bought dat nigger. Henry done good wuk all de summer, but sence de fall set in he 'pears ter be sorter pinin' away. Dey ain' nuffin pertickler de matter wid 'im--leastways de doctor say so--'cep'n' a tech er de rheumatiz; but his ha'r is all fell out, en ef he don't pick up his strenk mighty soon, I spec' I'm gwine ter lose 'im."

"Dey smoked on awhile, en bimeby ole mars say, 'Well, a bahgin's a bahgin, but you en me is good fren's, en I doan wan' ter see you lose all de money you paid fer dat digger [sic]; en ef w'at you say is so, en I ain't 'sputin' it, he ain't wuf much now. I spec's you wukked him too ha'd dis summer, er e'se de swamps down here don't agree wid de san'-hill nigger. So you des lemme know, en ef he gits any wusser I'll be willin' ter gib yer five hund'ed dollars fer 'im, en take my chances on his livin'.'

"Sho nuff, when Henry begun ter draw up wid de rheumatiz en it look like he gwine ter die fer sho, his noo marster sen' fer Mars Dugal', en Mars Dugal' gin him what he promus, en brung Henry home ag'in. He tuk good keer uv 'im dyoin' er de winter,--give 'im w'iskey ter rub his rheumatiz, en terbacker ter smoke, en all he want ter eat,--'caze a nigger w'at he could make a thousan' dollars a year off'n didn' grow on eve'y huckleberry bush.

"Nex' spring, w'en de sap ris en Henry's ha'r commence' ter sprout, Mars Dugal' sole 'im ag'in, down in Robeson County dis time; en he kep' dat sellin' business up fer five year er mo'. Henry nebber say nuffin 'bout de goopher ter his noo marsters, 'caze he know he gwine ter be tuk good keer uv de nex' winter, w'en Mars Dugal' buy him back. En Mars Dugal' made 'nuff money off'n Henry ter buy anudder plantation ober on Beaver Crick.

"But long 'bout de een' er dat five year dey come a stranger ter stop at de plantation. De fus' day he 'uz dere he went out wid Mars Dugal' en spent all de mawnin' lookin' ober de vimya'd, en atter dinner dey spent all de evenin' playin' kya'ds. De niggers soon 'skiver' dat he wuz a Yankee, en dat he come down ter Norf C'lina fer ter learn de w'ite folks how to raise grapes en make wine. He promus Mars Dugal' he cud make de grapevimes b'ar twice't ez many grapes, en dat de noo wine-press he wuz a-sellin' would make mo' d'n twice't ez many gallons er wine. En ole Mars Dugal' des drunk it all in, des 'peared ter be bewitched wit dat Yankee. W'en de darkies see dat Yankee runnin' 'roun de vimya'd en diggin' under de grapevimes, dey shuk dere heads, en 'lowed dat dey feared Mars Dugal' losin' his min'. Mars Dugal' had all de dirt dug away fum under de roots er all de scuppernon' vimes, an' let 'em stan' dat away fer a week er mo'. Den dat Yankee made de niggers fix up a mixtry er lime en ashes en manyo, en po' it roun' de roots er de grapevimes. Den he 'vise' Mars Dugal' fer ter trim de vimes close't, en Mars Dugal' tuck 'n done eve'ything de Yankee tole him ter do. Dyoin' all er dis time, mind yer, 'e wuz libbin' off'n de fat er de lan', at de big house, en playin' kyards wid Mars Dugal' eve'y night; en dey say Mars Dugal' los' mo'n a thousan' dollars dyoin' er de week dat Yankee wuz a runnin' de grapevimes.

"W'en de sap ris nex' spring, ole Henry 'n'inted his head ez yuzhal, en his ha'r commence' ter grow des de same ez it done eve'y year. De scuppernon' vimes growed monst's fas', en de leaves wuz greener en thicker dan dey eber be'n dyowin my rememb'ance; en Henry's ha'r growed out thicker dan eber, en he 'peared ter git younger 'n younger, en soopler 'n soopler; en seein' ez he wuz sho't er han's dat spring, havin' tuk in consid'able noo groun', Mars Dugal' 'cluded he wouldn' sell Henry 'tel he git de crap in en de cotton chop'. So he kep' Henry on de plantation.

"But 'long 'bout time fer de grapes ter come on de scuppernon' vimes, dey 'peared ter come a change ober dem; de leaves wivered en swivel' up, en de young grapes turn' yaller, en bimeby eve'ybody on de plantation could see dat de whole vimya'd wuz dyin'. Mars Dugal' tuck 'n water de vimes en done all he could, but 't wan' no use: dat Yankee done bus' de watermillyum. One time de vimes picked up a bit, en Mars Dugal' thought dey wuz gwine ter come out ag'in; but dat Yankee done dug too close unde' de roots, en prune de branches too close ter de vime, en all dat lime en ashes done burn' de life outen de vimes, en dey des kep' a with'in' en a swivelin'.

"All dis time de goopher wuz a-wukkin'. W'en de vimes commence' ter wither, Henry commence' ter complain er his rheumatiz, en when de leaves begin ter dry up his ha'r commence' ter drap out. When de vimes fresh up a bit Henry 'ud git peart agin, en when de vimes wither agin Henry 'ud git ole agin, en des kep' gittin' mo' en mo' fitten fer nuffin; he des pined away, en fine'ly tuk ter his cabin; en when de big vime whar he got de sap ter 'n'int his head withered en turned yaller en died, Henry died too,--des went out sorter like a cannel. Dey didn't 'pear ter be nuffin de matter wid 'im, 'cep'n de rheumatiz, but his strenk des dwinel' away 'tel he didn' hab ernuff lef' ter draw his bref. De goopher had got de under holt, en th'owed Henry fer good en all dat time.

"Mars Dugal' tuk on might'ly 'bout losin' his vimes en his nigger in de same year; en he swo' dat ef he could git hold er dat Yankee he'd wear 'im ter a frazzle, en den chaw up de frazzle; en he'd done it, too, for Mars Dugal' 'uz a monst'us brash man w'en he once git started. He sot de vimya'd out ober agin, but it wuz th'ee er fo' year befo' de vimes got ter b'arin' any scuppernon's.

"W'en de wah broke out, Mars Dugal' raise' a comp'ny, en went off ter fight de Yankees. He saw he wuz mighty glad dat wah come, en he des want ter kill a Yankee fer eve'y dollar he los' 'long er dat grape-raisin' Yankee. En I 'spec' he would a done it, too, ef de Yankees hadn' s'picioned sump'n, en killed him fus'. Atter de s'render ole miss move' ter town, de niggers all scattered 'way fum de plantation, en de vimya'd ain' be'n cultervated sence."

"Is that story true?" asked Annie, doubtfully, but seriously, as the old man concluded his narrative.

"It's des ez true ez I'm a-settin' here, miss. Dey's a easy way ter prove it: I kin lead de way right ter Henry's grave ober yander in de plantation buryin'-groun'. En I tell yer w'at, marster, I wouldn' 'vise yer to buy dis yer ole vimya'd, 'caze de goopher's on it yit, en dey ain' no tellin' w'en it's gwine ter crap out."

"But I thought you said all the old vines died."

"Dey did 'pear ter die, but a few ov 'em come out ag'in, en is mixed in mongs' de yuthers. I ain' skeered ter eat de grapes, 'caze I knows de old vimes fum de noo ones; but wid strangers dey ain' no tellin' w'at might happen. I wouldn' 'vise yer ter buy dis vimya'd."

I bought the vineyard, nevertheless, and it has been for a long time in a thriving condition, and is referred to by the local press as a striking illustration of the opportunities open to Northern capital in the development of Southern industries. The luscious scuppernong holds first rank among our grapes, though we cultivate a great many other varieties, and our income from grapes packed and shipped to the Northern markets is quite considerable. I have not noticed any developments of the goopher in the vineyard, although I have a mild suspicion that our colored assistants do not suffer from want of grapes during the season.

I found, when I bought the vineyard, that Uncle Julius had occupied a cabin on the place for many years, and derived a respectable revenue from the neglected grapevines. This, doubtless, accounted for his advice to me not to buy the vineyard, though whether it inspired the goopher story I am unable to state. I believe, however, that the wages I pay him for his services are more than an equivalent for anything he lost by the sale of the vineyard.

PO' SANDY by Charles W. Chesnutt

On the northeast corner of my vineyard in central North Carolina, and fronting on the Lumberton plank-road, there stood a small frame house, of the simplest construction. It was built of pine lumber, and contained but one room, to which one window gave light and one door admission. Its weather-beaten sides revealed a virgin innocence of paint. Against one end of the house, and occupying half its width, there stood a huge brick chimney: the crumbling mortar had left large cracks between the bricks; the bricks themselves had begun to scale off in large flakes, leaving the chimney sprinkled with unsightly blotches. These evidences of decay were but partially concealed by a creeping vine, which extended its slender branches hither and thither in an ambitious but futile attempt to cover the whole chimney. The wooden shutter, which had once protected the unglazed window, had fallen from its hinges, and lay rotting in the rank grass and jimson-weeds beneath. This building, I learned when I bought the place, had been used as a school-house for several years prior to the breaking out of the war, since which time it had remained unoccupied, save when some stray cow or vagrant hog had sought shelter within its walls from the chill rains and nipping winds of winter.

One day my wife requested me to build her a new kitchen. The house erected by us, when we first came to live upon the vineyard, contained a very conveniently arranged kitchen; but for some occult reason my wife wanted a kitchen in the back yard, apart from the dwelling-house, after the usual Southern fashion. Of course I had to build it.

To save expense, I decided to tear down the old school-house, and use the lumber, which was in a good state of preservation, in the construction of the new kitchen. Before demolishing the old house, however, I made an estimate of the amount of material contained in it, and found that I would have to buy several hundred feet of new lumber in order to build the new kitchen according to my wife's plan.

One morning old Julius McAdoo, our colored coachman, harnessed the gray mare to the rockaway, and drove my wife and me over to the saw-mill from which I meant to order the new lumber. We drove down the long lane which led from our house to the plank-road; following the plank-road for about a mile, we turned into a road running through the forest and across the swamp to the sawmill beyond. Our carriage jolted over the half-rotted corduroy road which traversed the swamp, and then climbed the long hill leading to the saw-mill. When we reached the mill, the foreman had gone over to a neighboring farm-house, probably to smoke or gossip, and we were compelled to await his return before we could transact our business. We remained seated in the carriage, a few rods from the mill, and watched the leisurely movements of the mill-hands. We had not waited long before a huge pine log was placed in position, the machinery of the mill was set in motion, and the circular saw began to eat its way through the log, with a loud whirr which resounded throughout the vicinity of the mill. The sound rose and fell in a sort of rhythmic cadence, which, heard from where we sat, was not unpleasing, and not loud enough to prevent conversation. When the saw started on its second journey through the log, Julius observed, in a lugubrious tone, and with a perceptible shudder:--

"Ugh! but dat des do cuddle my blood!"

"What's the matter, Uncle Julius?" inquired my wife, who is of a very sympathetic turn of mind. "Does the noise affect your nerves?"

"No, Miss Annie," replied the old man, with emotion, "I ain' narvous; but dat saw, a-cuttin' en grindin' thoo dat stick er timber, en moanin', en groanin', en sweekin', kyars my 'memb'ance back ter ole times, en 'min's me er po' Sandy." The pathetic intonation with which he lengthened out the "po' Sandy" touched a responsive chord in our own hearts.

"And who was poor Sandy?" asked my wife, who takes a deep interest in the stories of plantation life which she hears from the lips of the older colored people. Some of these stories are quaintly humorous; others wildly extravagant, revealing the Oriental cast of the negro's imagination; while others, poured freely into the sympathetic ear of a Northern-bred woman, disclose many a tragic incident of the darker side of slavery.

"Sandy," said Julius, in reply to my wife's question, "was a nigger w'at useter b'long ter ole Mars Marrabo McSwayne. Mars Marrabo's place wuz on de yuther side'n de swamp, right nex' ter yo' place. Sandy wuz a monst'us good nigger, en could do so many things erbout a plantation, en alluz 'ten ter his wuk so well, dat w'en Mars Marrabo's chilluns growed up en married off, dey all un 'em wanted dey daddy fer ter gin 'em Sandy fer a weddin' present. But Mars Marrabo knowed de res' wouldn' be satisfied ef he gin Sandy ter a'er one un 'em; so w'en dey wuz all done married, he fix it by 'lowin' one er his chilluns ter take Sandy fer a mont' er so, en den ernudder for a mont' er so, en so on dat erway tel dey had all had 'im de same lenk er time; en den dey would all take him roun' ag'in, 'cep'n oncet in a w'ile w'en Mars Marrabo would len' 'im ter some er his yuther kinfolks 'roun' de country, w'en dey wuz short er han's; tel bimeby it go so Sandy didn' hardly knowed whar he wuz gwine ter stay fum one week's een ter de yuther.

"One time w'en Sandy wuz lent out ez yushal, a spekilater come erlong wid a lot er niggers, en Mars Marrabo swap' Sandy's wife off fer a noo 'oman. W'en Sandy come back, Mars Marrabo gin 'im a dollar, en 'lowed he wuz monst'us sorry fer ter break up de fambly, but de spekilater had gin 'im big boot, en times wuz hard en money skase, en so he wuz bleedst ter make de trade. Sandy tuk on some 'bout losin' his wife, but he soon seed dey want no use cryin' ober spilt merlasses; en bein' ez he lacked de looks er de noo 'ooman, he tuk up wid her atter she b'n on de plantation a mont' er so.

"Sandy en his noo wife got on mighty well tergedder, en de niggers all 'mence' ter talk about how lovin' dey wuz. W'en Tenie wuz tuk sick oncet, Sandy useter set up all night wid 'er, en den go ter wuk in de mawnin' des lack he had his reg'lar sleep; en Tenie would 'a done anythin' in de worl' for her Sandy.

"Sandy en Tenie hadn' b'en libbin' tergedder fer mo' d'n two mont's befo' Mars Marrabo's old uncle, w'at libbed down in Robeson County, sent up ter fine out ef Mars Marrabo couldn' len' 'im er hire 'im a good han' fer a mont' er so. Sandy's marster wuz one er dese yer easy-gwine folks w'at wanter please eve'ybody, en he says yas, he could len' 'im Sandy. En Mars Marrabo tole Sandy fer ter git ready ter go down ter Robeson nex' day, fer ter stay a mont' er so.

"Hit wuz monst'us hard on Sandy fer ter take 'im 'way fum Tenie. Hit wuz so fur down ter Robeson dat he didn' hab no chance er comin' back ter see her tel de time wuz up; he wouldn' a' mine comin' ten er fifteen mile at night ter see Tenie, but Mars Marrabo's uncle's plantation wuz mo' d'n forty mile off. Sandy wuz mighty sad en cas' down atter w'at Mars Marrabo tole 'im, en he says ter Tenie, sezee:--

"'I'm gittin monstus ti'ed er dish yer gwine roun' so much. Here I is lent ter Mars Jeems dis mont', en I got ter do so-en-so; en ter Mars Archie de nex' mont', en I got ter do so-en-so; den I got ter go ter Miss Jinnie's: en hit's Sandy dis en Sandy dat, en Sandy yer en Sandy dere, tel it 'pears ter me I ain' got no home, ner no marster, ner no mistiss, ner no nuffin'. I can't eben keep a wife: my yuther ole 'oman wuz sole away widout my gittin' a chance fer ter tell her good-by; en now I got ter go off en leab you, Tenie, en I dunno whe'r I'm eber gwine ter see yer ag'in er no. I wisht I wuz a tree, er a stump, er a rock, er sump'n w'at could stay on de plantation fer a w'ile.'

"Atter Sandy got thoo talkin', Tenie didn' say naer word, but des sot dere by de fier, studyin' en studyin'. Bimeby she up'n says:--

"'Sandy, is I eber tole you I wuz a cunjuh-'ooman?'

"Co'se Sandy hadn' nebber dremp' er nuffin lack dat, en he made a great miration w'en he hear w'at Tenie say. Bimeby Tenie went on:--

"'I ain' goophered nobody, ner done no cunjuh-wuk fer fifteen yer er mo; en w'en I got religion I made up my mine I wouldn' wuk no mo' goopher. But dey is some things I doan b'lieve it's no sin fer ter do; en ef you doan wanter be sent roun' fum pillar ter pos', en ef you doan wanter go down ter Robeson, I kin fix things so yer won't haf ter. Ef you'll des say de word, I kin turn yer ter w'ateber yer wanter be, en yer kin stay right whar yer wanter, ez long ez yer mineter.'

"Sandy say he doan keer; he's willin' fer ter do anythin' fer ter stay close ter Tenie. Den Tenie ax 'im ef he doan wanter be turnt inter a rabbit.

"Sandy say, 'No, de dogs mout git atter me.'

"'Shill I turn yer ter a wolf?' sez Tenie.

"'No, eve'ybody's skeered er a wolf, en I doan want nobody ter be skeered er me.'

"'Shill I turn yer ter a mawkin'-bird?'

"'No, a hawk mout ketch me. I wanter be turnt inter sump'n w'at'll stay in one place.'

"'I kin turn yer ter a tree,' sez Tenie. 'You won't hab no mouf ner years, but I kin turn yer back oncet in a w'ile, so yer kin git sump'n ter eat, en hear w'at's gwine on.'

"Well, Sandy say dat'll do. En so Tenie tuk 'im down by de aidge er de swamp, not fur fum de quarters, en turnt 'im inter a big pine-tree, en sot 'im out mongs' some yuther trees. En de nex' mawnin', ez some er de fiel' han's wuz gwine long dere, dey seed a tree w'at dey didn' 'member er habbin' seed befo; it wuz monst'us quare, en dey wuz bleedst ter 'low dat dey hadn' 'membered right, er e'se one er de saplin's had be'n growin' monst'us fas'.

"W'en Mars Marrabo 'skiver' dat Sandy wuz gone, he 'lowed Sandy had runned away. He got de dogs out, but de las' place dey could track Sandy ter wuz de foot er dat pine-tree. En dere de dogs stood en barked, en bayed, en pawed at de tree, en tried ter climb up on it; en w'en dey wuz tuk roun' thoo de swamp ter look fer de scent, dey broke loose en made fer dat tree ag'in. It wuz de beatenis' thing de w'ite folks eber hearn of, en Mars Marrabo 'lowed dat Sandy must a' clim' up on de tree en jump' off on a mule er sump'n, en rid fur 'nuff fer ter spile de scent. Mars Marrabo wanted ter 'cuse some er de yuther niggers er heppin Sandy off, but dey all 'nied it ter de las'; en eve'ybody knowed Tenie sot too much by Sandy fer ter he'p 'im run away whar she couldn' nebber see 'im no mo'.

"W'en Sandy had be'n gone long 'nuff fer folks ter think he done got clean away, Tenie useter go down ter de woods at night en turn 'im back, en den dey'd slip up ter de cabin en set by de fire en talk. But dey ha' ter be monst'us keerful, er e'se somebody would a seed 'em, en dat would a spile de whole thing; so Tenie alluz turnt Sandy back in de mawnin' early, befo' anybody wuz a'stirrin'.

"But Sandy didn' git erlong widout his trials en tribberlations. One day a woodpecker come erlong en 'mence' ter peck at de tree; en de nex' time Sandy wuz turnt back he had a little roun' hole in his arm, des lack a sharp stick be'n stuck in it. Atter dat Tenie sot a sparrer-hawk fer ter watch de tree; en w'en de woodpecker come erlong nex' mawnin' fer ter finish his nes', he got gobble' up mos' fo' he stuck his bill in de bark.

"Nudder time, Mars Marrabo sent a nigger out in de woods fer ter chop tuppentime boxes. De man chop a box in dish yer tree, en hack' de bark up two er th'ee feet, fer ter let de tuppentime run. De nex' time Sandy wuz turnt back he had a big skyar on his lef' leg, des lack it be'n skunt; en it tuk Tenie nigh 'bout all night fer ter fix a mixtry ter kyo it up. Atter dat, Tenie sot a hawnet fer ter watch de tree; en w'en de nigger come back ag'in fer ter cut ernudder box on de yuther side'n de tree, de hawnet stung 'im so hard dat de ax slip en cut his foot nigh 'bout off.

"W'en Tenie see so many things happenin' ter de tree, she 'cluded she'd ha' ter turn Sandy ter sump'n e'se; en atter studyin' de matter ober, en talkin' wid Sandy one ebenin', she made up her mine fer ter fix up a goopher mixtry w'at would turn herse'f en Sandy ter foxes, er sump'n, so dey could run away en go some'rs whar dey could be free en lib lack w'ite folks.

"But dey ain' no tellin' w'at's gwine ter happen in dis worl'. Tenie had got de night sot fer her en Sandy ter run away, w'en dat ve'y day one er Mars Marrabo's sons rid up ter de big house in his buggy, en say his wife wuz monst'us sick, en he want his mammy ter len' 'im a 'ooman fer ter nuss his wife. Tenie's mistiss say sen Tenie; she wuz a good nuss. Young mars wuz in a tarrible hurry fer ter git back home. Tenie wuz washin' at de big house dat day, en her mistiss say she should go right 'long wid her young marster. Tenie tried ter make some 'scuse fer ter git away en hide tel night, w'en she would have eve'ything fix' up fer her en Sandy; she say

she wanter go ter her cabin fer ter git her bonnet. Her mistiss say it doan matter 'bout de bonnet; her head-hankcher wuz good 'nuff. Den Tenie say she wanter git her bes' frock; her mistiss say no, she doan need no mo' frock, en w'en dat one got dirty she could git a clean one whar she wuz gwine. So Tenie had ter git in de buggy en go 'long wid young Mars Dunkin ter his plantation, w'ich wuz mo' d'n twenty mile away; en dey want no chance er her seein' Sandy no mo' tel she come back home. De po' gal felt monst'us bad erbout de way things wuz gwine on, en she knowed Sandy mus' be a wond'rin' why she didn' come en turn 'im back no mo'.

"W'iles Tenie wuz away nussin' young Mars Dunkin's wife, Mars Marrabo tuk a notion fer ter buil' 'im a noo kitchen; en bein' ez he had lots er timber on his place, he begun ter look 'roun' fer a tree ter hab de lumber sawed out'n. En I dunno how it come to be so, but he happen fer ter hit on de ve'y tree w'at Sandy wuz turnt inter. Tenie wuz gone, en dey wa'n't nobody ner nuffin' fer ter watch de tree.

"De two men w'at cut de tree down say dey nebber had sech a time wid a tree befo': dey axes would glansh off, en didn' 'pear ter make no progress thoo de wood; en of all de creakin', en shakin', en wobblin' you eber see, dat tree done it w'en it commence' ter fall. It wuz de beatenis' thing!

"W'en dey got de tree all trim' up, dey chain it up ter a timber waggin, en start fer de saw-mill. But dey had a hard time gittin' de log dere: fus' dey got stuck in de mud w'en dey wuz gwine crosst de swamp, en it wuz two er th'ee hours befo' dey could git out. W'en dey start' on ag'in, de chain kep' a-comin' loose, en dey had ter keep a-stoppin' en a-stoppin' fer ter hitch de log up ag'in. W'en dey commence' ter climb de hill ter de saw-mill, de log broke loose, en roll down de hill en in mongs' de trees, en hit tuk nigh 'bout half a day mo' ter git it haul' up ter de saw-mill.

"De nex' mawnin' atter de day de tree wuz haul' ter de saw-mill, Tenie come home. W'en she got back ter her cabin, de fus' thing she done wuz ter run down ter de woods en see how Sandy wuz gittin' on. W'en she seed de stump standin' dere, wid de sap runnin' out'n it, en de limbs layin' scattered roun', she nigh 'bout went out'n her mine. She run ter her cabin, en got her goopher mixtry, en den foller de track er de timber waggin ter de saw-mill. She knowed Sandy couldn' lib mo' d'n a minute er so ef she turn' him back, fer he wuz all chop' up so he'd a be'n bleedst ter die. But she wanted ter turn 'im back long ernuff fer ter 'splain ter 'im dat she hadn' went off a-purpose, en lef' 'im ter be chop' down en sawed up. She didn' want Sandy ter die wid no hard feelin's to'ds her.

"De han's at de saw-mill had des got de big log on de kerridge, en wuz startin' up de saw, w'en dey seed a 'oman runnin up de hill, all out er bref, cryin' en gwine on des lack she wuz plumb 'stracted. It wuz Tenie; she come right inter de mill, en th'owed herse'f on de log, right in front er de saw, a-hollerin' en cryin' ter her Sandy ter fergib her, en not ter think hard er her, fer it wa'n't no fault er hern. Den Tenie 'membered de tree didn' hab no years, en she wuz gittin' ready fer ter wuk her goopher mixtry so ez ter turn Sandy back, w'en de mill-hands kotch holt er her en tied her arms wid a rope, en fasten' her to one er de posts in de saw-mill; en den dey started de saw up ag'in, en cut de log up inter bo'ds en scantlin's right befo' her eyes. But it wuz mighty hard wuk; fer of all de sweekin', en moanin', en groanin', dat log done it w'iles de saw wuz a-cuttin' thoo it. De saw wuz one er dese yer ole-timey, up-en-down saws, en hit tuk longer dem days ter saw a log 'en it do now. Dey greased de saw, but dat didn' stop de fuss; hit kep' right on, tel finely dey got de log all sawed up.

"W'en de oberseah w'at run de saw-mill come fum brekfas', de han's up en tell him 'bout de crazy 'ooman--ez dey s'posed she wuz--w'at had come runnin' in de saw-mill, a-hollerin' en gwine on, en tried ter th'ow herse'f befo' de saw. En de oberseah sent two er th'ee er de han's fer ter take Tenie back ter her marster's plantation.

"Tenie 'peared ter be out'n her mine fer a long time, en her marster ha' ter lock her up in de smoke-'ouse tel she got ober her spells. Mars Marrabo wuz monst'us mad, en hit would a made yo' flesh crawl fer ter hear him cuss, caze he say de spekilater w'at he got Tenie fum had fooled 'im by wukkin' a crazy 'oman off on him. Wiles Tenie wuz lock up in de smoke-'ouse, Mars Marrabo tuk'n' haul de lumber fum de saw-mill, en put up his noo kitchen.

"W'en Tenie got quiet' down, so she could be 'lowed ter go 'roun' de plantation, she up'n tole her marster all erbout Sandy en de pine-tree; en w'en Mars Marrabo hearn it, he 'lowed she wuz de wuss 'stracted nigger he eber hearn of. He didn' know w'at ter do wid Tenie: fus' he thought he'd put her in de po'-house; but finely, seein' ez she didn' do no harm ter nobody ner nuffin', but des went roun' moanin', en groanin', en shakin' her head, he 'cluded ter let her stay on de plantation en nuss de little nigger chilluns w'en dey mammies wuz ter wuk in de cotton-fiel'.

"De noo kitchen Mars Marrabo buil' wuzn' much use, fer it hadn' be'n put up long befo' de niggers 'mence' ter notice quare things erbout it. Dey could hear sump'n moanin' en groanin' 'bout de kitchen in de night-time, en w'en de win' would blow dey could hear

sump'n a-hollerin' en sweekin' lack hit wuz in great pain en sufferin'. En hit got so atter a w'ile dat hit wuz all Mars Marrabo's wife could do ter git a 'ooman ter stay in de kitchen in de daytime long ernuff ter do de cookin'; en dey wa'n't naer nigger on de plantation w'at wouldn' rudder take forty dan ter go 'bout dat kitchen atter dark,--dat is, 'cep'n Tenie; she didn' pear ter mine de ha'nts. She useter slip 'roun' at night, en set on de kitchen steps, en lean up agin de do'-jamb, en run on ter herse'f wid some kine er foolishness w'at nobody couldn' make out; fer Mars Marrabo had th'eaten' ter sen' her off'n de plantation ef she say anything ter any er de yuther niggers 'bout de pine-tree. But somehow er nudder de niggers foun' out all 'bout it, en dey knowed de kitchen wuz ha'anted by Sandy's sperrit. En bimeby hit got so Mars Marrabo's wife herse'f wuz skeered ter go out in de yard atter dark.

"W'en it come ter dat, Mars Marrabo tuk 'n' to' de kitchen down, en use' de lumber fer ter buil' dat ole school-'ouse w'at youer talkin' 'bout pullin' down. De school-'ouse wuzn' use' 'cep'n' in de daytime, en on dark nights folks gwine 'long de road would hear quare soun's en see quare things. Po' ole Tenie useter go down dere at night, en wander 'roun' de school-'ouse; en de niggers all 'lowed she went fer ter talk wid Sandy's sperrit. En one winter mawnin', w'en one er de boys went ter school early fer ter start de fire, w'at should he fine but po' ole Tenie, layin' on de flo', stiff, en cole, en dead. Dere didn' 'pear ter be nuffin' pertickler de matter wid her,--she had des grieve' herse'f ter def fer her Sandy. Mars Marrabo didn' shed no tears. He thought Tenie wuz crazy, en dey wa'n't no tellin' w'at she mout do nex'; en dey ain' much room in dis worl' fer crazy w'ite folks, let 'lone a crazy nigger.

"Hit wa'n't long atter dat befo' Mars Marrabo sole a piece er his track er lan' ter Mars Dugal' McAdoo,--MY ole marster,--en dat's how de ole school-house happen to be on yo' place. W'en de wah broke out, de school stop', en de ole school-'ouse be'n stannin' empty ever sence,--dat is, 'cep'n' fer de ha'nts. En folks sez dat de ole school-'ouse, er any yuther house w'at got any er dat lumber in it w'at wuz sawed out'n de tree w'at Sandy wuz turnt inter, is gwine ter be ha'nted tel de las' piece er plank is rotted en crumble' inter dus'."

Annie had listened to this gruesome narrative with strained attention.

"What a system it was," she exclaimed, when Julius had finished, "under which such things were possible!"

"What things?" I asked, in amazement. "Are you seriously considering the possibility of a man's being turned into a tree?"

"Oh, no," she replied quickly, "not that;" and then she added absently, and with a dim look in her fine eyes, "Poor Tenie!"

We ordered the lumber, and returned home. That night, after we had gone to bed, and my wife had to all appearances been sound asleep for half an hour, she startled me out of an incipient doze by exclaiming suddenly,--

"John, I don't believe I want my new kitchen built out of the lumber in that old school-house."

"You wouldn't for a moment allow yourself," I replied, with some asperity, "to be influenced by that absurdly impossible yarn which Julius was spinning to-day?"

"I know the story is absurd," she replied dreamily, "and I am not so silly as to believe it. But I don't think I should ever be able to take any pleasure in that kitchen if it were built out of that lumber. Besides, I think the kitchen would look better and last longer if the lumber were all new."

Of course she had her way. I bought the new lumber, though not without grumbling. A week or two later I was called away from home on business. On my return, after an absence of several days, my wife remarked to me,--

"John, there has been a split in the Sandy Run Colored Baptist Church, on the temperance question. About half the members have come out from the main body, and set up for themselves. Uncle Julius is one of the seceders, and he came to me yesterday and asked if they might not hold their meetings in the old school-house for the present."

"I hope you didn't let the old rascal have it," I returned, with some warmth. I had just received a bill for the new lumber I had bought.

"Well," she replied, "I could not refuse him the use of the house for so good a purpose."

"And I'll venture to say," I continued, "that you subscribed something toward the support of the new church?"

She did not attempt to deny it.

"What are they going to do about the ghost?" I asked, somewhat curious to know how Julius would get around this obstacle.

"Oh," replied Annie, "Uncle Julius says that ghosts never disturb religious worship, but that if Sandy's spirit SHOULD happen to stray into meeting by mistake, no doubt the preaching would do it good."

DAVE'S NECKLISS by Charles W. Chesnutt

"Have some dinner, Uncle Julius?" said my wife.

It was a Sunday afternoon in early autumn. Our two women-servants had gone to a camp-meeting some miles away, and would not return until evening. My wife had served the dinner, and we were just rising from the table, when Julius came up the lane, and, taking off his hat, seated himself on the piazza.

The old man glanced through the open door at the dinner-table, and his eyes rested lovingly upon a large sugar-cured ham, from which several slices had been cut, exposing a rich pink expanse that would have appealed strongly to the appetite of any hungry Christian.

"Thanky, Miss Annie," he said, after a momentary hesitation, "I dunno ez I keers ef I does tas'e a piece er dat ham, ef yer'll cut me off a slice un it."

"No," said Annie, "I won't. Just sit down to the table and help yourself; eat all you want, and don't be bashful."

Julius drew a chair up to the table, while my wife and I went out on the piazza. Julius was in my employment; he took his meals with his own family, but when he happened to be about our house at meal-times, my wife never let him go away hungry.

I threw myself into a hammock, from which I could see Julius through an open window. He ate with evident relish, devoting his attention chiefly to the ham, slice after slice of which disappeared in the spacious cavity of his mouth. At first the old man ate rapidly, but after the edge of his appetite had been taken off he proceeded in a more leisurely manner. When he had cut the sixth slice of ham (I kept count of them from a lazy curiosity to see how much he COULD eat) I saw him lay it on his plate; as he adjusted the knife and fork to cut it into smaller pieces, he paused, as if struck by a sudden thought, and a tear rolled down his rugged cheek and fell upon the slice of ham before him. But the emotion, whatever the thought that caused it, was transitory, and in a moment he continued his dinner. When he was through eating, he came out on the porch, and resumed his seat with the satisfied expression of countenance that usually follows a good dinner.

"Julius," I said, "you seemed to be affected by something, a moment ago. Was the mustard so strong that it moved you to tears?"

"No, suh, it wa'n't de mustard; I wuz studyin' 'bout Dave."

"Who was Dave, and what about him?" I asked.

The conditions were all favorable to story-telling. There was an autumnal languor in the air, and a dreamy haze softened the dark green of the distant pines and the deep blue of the Southern sky. The generous meal he had made had put the old man in a very good humor. He was not always so, for his curiously undeveloped nature was subject to moods which were almost childish in their variableness. It was only now and then that we were able to study, through the medium of his recollection, the simple but intensely human inner life of slavery. His way of looking at the past seemed very strange to us; his view of certain sides of life was essentially different from ours. He never indulged in any regrets for the Arcadian joyousness and irresponsibility which was a somewhat popular conception of slavery; his had not been the lot of the petted house-servant, but that of the toiling field-hand. While he mentioned with a warm appreciation the acts of kindness which those in authority had shown to him and his people, he would speak of a cruel deed, not with the indignation of one accustomed to quick feeling and spontaneous expression, but with a furtive disapproval which suggested to us a doubt in his own mind as to whether he had a right to think or to feel, and presented to us the curious psychological spectacle of a mind enslaved long after the shackles had been struck off from the limbs of its possessor. Whether the sacred name of liberty ever set his soul aglow with a generous fire; whether he had more than the most elementary ideas of love, friendship, patriotism, religion,--things which are half, and the better half, of life to us; whether he even realized, except in a vague, uncertain way, his own degradation, I do not know. I fear not; and if not, then centuries of repression had borne their legitimate fruit. But in the simple human feeling, and still more in the undertone of sadness, which pervaded his stories, I thought I could see a spark which, fanned by favoring breezes and fed by the memories of the past, might become in his children's children a glowing flame of sensibility, alive to every thrill of human happiness or human woe.

"Dave use' ter b'long ter my ole marster," said Julius; "he wuz raise' on dis yer plantation, en I kin 'member all erbout 'im, fer I wuz ole 'nuff ter chop cotton w'en it all happen'. Dave wuz a tall man, en monst'us strong: he could do mo' wuk in a day dan any yuther two niggers on de plantation. He wuz one er dese yer solemn kine er men, en nebber run on wid much foolishness, like de yuther darkies. He use' ter go out in de woods en pray; en w'en he hear de han's on de plantation cussin' en gwine on wid dere dancin' en foolishness, he use' ter tell 'em 'bout religion en jedgmen'-day, w'en dey would haf ter gin account fer eve'y idle word en all dey yuther sinful kyarin's-on.

"Dave had l'arn' how ter read de Bible. Dey wuz a free nigger boy in de settlement w'at wuz monst'us smart, en could write en cipher, en wuz alluz readin' books er papers. En Dave had hi'ed dis free boy fer ter l'arn 'im how ter read. Hit wuz 'g'in de law, but co'se none er de niggers didn' say nuffin ter de w'ite folks 'bout it. Howsomedever, one day Mars Walker--he wuz de oberseah--foun' out Dave could read. Mars Walker wa'n't nuffin but a po' bockrah, en folks said he couldn' read ner write hisse'f, en co'se he didn' lack ter see a nigger w'at knowed mo' d'n he did; so he went en tole Mars Dugal'. Mars Dugal' sont fer Dave, en ax' 'im 'bout it.

"Dave didn't hardly knowed w'at ter do; but he couldn' tell no lie, so he 'fessed he could read de Bible a little by spellin' out de words. Mars Dugal' look' mighty solemn.

"'Dis yer is a se'ious matter,' sezee; 'it's 'g'in de law ter l'arn niggers how ter read, er 'low 'em ter hab books. But w'at yer l'arn out'n dat Bible, Dave?'

"Dave wa'n't no fool, ef he wuz a nigger, en sezee:--

"'Marster, I l'arns dat it's a sin fer ter steal, er ter lie, er fer ter want w'at doan b'long ter yer; en I l'arns fer ter love de Lawd en ter 'bey my marster.'

"Mars Dugal' sorter smile' en laf' ter hisse'f, like he 'uz might'ly tickle' 'bout sump'n, en sezee:--

"'Doan 'pear ter me lack readin' de Bible done yer much harm, Dave. Dat's w'at I wants all my niggers fer ter know. Yer keep right on readin', en tell de yuther han's w'at yer be'n tellin' me. How would yer lack fer ter preach ter de niggers on Sunday?'

"Dave say he'd be glad fer ter do w'at he could. So Mars Dugal' tole de oberseah fer ter let Dave preach ter de niggers, en tell 'em w'at wuz in de Bible, en it would he'p ter keep 'em fum stealin' er runnin' erway.

"So Dave 'mence' ter preach, en done de han's on de plantation a heap er good, en most un 'em lef' off dey wicked ways, en 'mence' ter love ter hear 'bout God, en religion, en de Bible; en dey done dey wuk better, en didn' gib de oberseah but mighty little trouble fer ter manage 'em.

"Dave wuz one er dese yer men w'at didn' keer much fer de gals,--leastways he didn' tel Dilsey come ter de plantation. Dilsey wuz a monst'us peart, good-lookin', gingybread-colored gal,--one er dese yer high-steppin' gals w'at hol's dey heads up, en won' stan' no foolishness fum no man. She had b'long' ter a gemman over on Rockfish, w'at died, en whose 'state ha' ter be sol' fer ter pay his debts. En Mars Dugal' had b'en ter de oction, en w'en he seed dis gal a-cryin' en gwine on 'bout bein' sol' erway fum her ole mammy, Aun' Mahaly, Mars Dugal' bid 'em bofe in, en fotch 'em ober ter our plantation.

"De young nigger men on de plantation wuz des wil' atter Dilsey, but it didn' do no good, en none un 'em couldn' git Dilsey fer dey junesey,[2] 'tel Dave 'mence' fer ter go roun' Aun' Mahaly's cabin. Dey wuz a fine-lookin' couple, Dave en Dilsey wuz, bofe tall, en well-shape', en soopl'. En dey sot a heap by one ernudder. Mars Dugal' seed 'em tergedder one Sunday, en de nex' time he seed Dave atter dat, sezee:--

"Dave, w'en yer en Dilsey gits ready fer ter git married, I ain' got no rejections. Dey's a poun' er so er chawin'-terbacker up at de house, en I reckon yo' mist'iss kin fine a frock en a ribbin er two fer Dilsey. Youer bofe good niggers, en yer neenter be feared er bein' sol' 'way fum one ernudder long ez I owns dis plantation; en I 'spec's ter own it fer a long time yit.'"

[Footnote 2: Sweetheart.]

"But dere wuz one man on de plantation w'at didn' lack ter see Dave en Dilsey tergedder ez much ez ole marster did. W'en Mars Dugal' went ter de sale whar he got Dilsey en Mahaly, he bought ernudder han', by de name er Wiley. Wiley wuz one er dese yer shiny-eyed, double-headed little niggers, sha'p ez a steel trap, en sly ez de fox w'at keep out'n it. Dis yer Wiley had be'n pesterin' Dilsey 'fo' she come ter our plantation, en had nigh 'bout worried de life out'n her. She didn' keer nuffin fer 'im, but he pestered her

so she ha' ter th'eaten ter tell her marster fer ter make Wiley let her 'lone. W'en he come ober to our place it wuz des ez bad, 'tel bimeby Wiley seed dat Dilsey had got ter thinkin' a heap 'bout Dave, en den he sorter hilt off aw'ile, en purten' lack he gin Dilsey up. But he wuz one er dese yer 'ceitful niggers, en w'ile he wuz laffin' en jokin' wid de yuther han's 'bout Dave en Dilsey, he wuz settin' a trap fer ter ketch Dave en git Dilsey back fer hisse'f.

"Dave en Dilsey made up dere min's fer ter git married long 'bout Christmas time, w'en dey'd hab mo' time fer a weddin'. But 'long 'bout two weeks befo' dat time ole mars 'mence' ter lose a heap er bacon. Eve'y night er so somebody 'ud steal a side er bacon, er a ham, er a shoulder, er sump'n, fum one er de smoke-'ouses. De smoke-'ouses wuz lock', but somebody had a key, en manage' ter git in some way er 'nudder. Dey's mo' ways 'n one ter skin a cat, en dey's mo' d'n one way ter git in a smoke-'ouse,--leastways dat's w'at I hearn say. Folks w'at had bacon fer ter sell didn' hab no trouble 'bout gittin' rid un it. Hit wuz 'g'in' de law fer ter buy things fum slabes; but Lawd! dat law didn' 'mount ter a hill er peas. Eve'y week er so one er dese yer big covered waggins would come 'long de road, peddlin' terbacker en w'iskey. Dey wuz a sight er room in one er dem big waggins, en it wuz monst'us easy fer ter swop off bacon fer sump'n ter chaw er ter wa'm yer up in de winter-time. I s'pose de peddlers didn' knowed dey wuz breakin' de law, caze de niggers alluz went at night, en stayed on de dark side er de waggin; en it wuz mighty hard fer ter tell W'AT kine er folks dey wuz.

"Atter two er th'ee hund'ed er meat had be'n stole', Mars Walker call all de niggers up one ebenin', en tol' 'em dat de fus' nigger he cot stealin' bacon on dat plantation would git sump'n fer ter 'member it by long ez he lib'. En he say he'd gin fi' dollars ter de nigger w'at 'skiver' de rogue. Mars Walker say he s'picion' one er two er de niggers, but he couldn' tell fer sho, en co'se dey all 'nied it w'en he 'cuse em un it.

"Dey wa'n't no bacon stole' fer a week er so, 'tel one dark night w'en somebody tuk a ham fum one er de smoke-'ouses. Mars Walker des cusst awful w'en he foun' out de ham wuz gone, en say he gwine ter sarch all de niggers' cabins; w'en dis yer Wiley I wuz tellin' yer 'bout up'n say he s'picion' who tuk de ham, fer he seed Dave comin' 'cross de plantation fum to'ds de smoke-'ouse de night befo'. W'en Mars Walker hearn dis fum Wiley, he went en sarch' Dave's cabin, en foun' de ham hid under de flo'.

"Eve'ybody wuz 'stonish'; but dere wuz de ham. Co'se Dave 'nied it ter de las', but dere wuz de ham. Mars Walker say it wuz des ez he 'spected: he didn' b'lieve in dese yer readin' en prayin' niggers; it wuz all 'pocrisy, en sarve' Mars Dugal' right fer 'lowin' Dave ter be readin' books w'en it wuz 'g'in de law.

"W'en Mars Dugal' hearn 'bout de ham, he say he wuz might'ly 'ceived en disapp'inted in Dave. He say he wouldn' nebber hab no mo' conferdence in no nigger, en Mars Walker could do des ez he wuz a mineter wid Dave er any er de res' er de niggers. So Mars Walker tuk'n tied Dave up en gin 'im forty; en den he got some er dis yer wire clof w'at dey uses fer ter make sifters out'n, en tuk'n wrap' it roun' de ham en fasten it tergedder at de little een'. Den he tuk Dave down ter de blacksmif-shop, en had Unker Silas, de plantation black-smif, fasten a chain ter de ham, en den fasten de yuther een' er de chain roun' Dave's neck. En den he says ter Dave, sezee:--

"'Now, suh, yer'll wear dat neckliss fer de nex' six mont's; en I 'spec's yer ner none er de yuther niggers on dis plantation won' steal no mo' bacon dyoin' er dat time.'

"Well, it des 'peared ez if fum dat time Dave didn' hab nuffin but trouble. De niggers all turnt ag'in' 'im, caze he be'n de 'casion er Mars Dugal' turnin' 'em all ober ter Mars Walker. Mars Dugal' wa'n't a bad marster hisse'f, but Mars Walker wuz hard ez a rock. Dave kep' on sayin' he didn' take de ham, but none un 'em didn' b'lieve 'im.

"Dilsey wa'n't on de plantation w'en Dave wuz 'cused er stealin' de bacon. Ole mist'iss had sont her ter town fer a week er so fer ter wait on one er her darters w'at had a young baby, en she didn' fine out nuffin 'bout Dave's trouble 'tel she got back ter de plantation. Dave had patien'ly endyoed de finger er scawn, en all de hard words w'at de niggers pile' on 'im, caze he wuz sho' Dilsey would stan' by 'im, en wouldn' b'lieve he wuz a rogue, ner none er de yuther tales de darkies wuz tellin' 'bout 'im.

"W'en Dilsey come back fum town, en got down fum behine de buggy whar she be'n ridin' wid ole mars, de fus' nigger 'ooman she met says ter her,--

"'Is yer seed Dave, Dilsey?'

"No, I ain' seed Dave,' says Dilsey.

"'Yer des oughter look at dat nigger; reckon yer wouldn' want 'im fer yo' junesey no mo'. Mars Walker cotch 'im stealin' bacon, en gone en fasten' a ham roun' his neck, so he can't git it off'n hisse'f. He sut'nly do look quare.' En den de 'ooman bus' out laffin' fit ter kill herse'f. W'en she got thoo laffin' she up'n tole Dilsey all 'bout de ham, en all de yuther lies w'at de niggers be'n tellin' on Dave.

"W'en Dilsey started down ter de quarters, who should she meet but Dave, comin' in fum de cotton-fiel'. She turnt her head ter one side, en purten' lack she didn' seed Dave.

"'Dilsey!' sezee.

"Dilsey walk' right on, en didn' notice 'im.

"'OH, Dilsey!'

"Dilsey didn' paid no 'tention ter 'im, en den Dave knowed some er de niggers be'n tellin' her 'bout de ham. He felt monst'us bad, but he 'lowed ef he could des git Dilsey fer ter listen ter 'im fer a minute er so, he could make her b'lieve he didn' stole de bacon. It wuz a week er two befo' he could git a chance ter speak ter her ag'in; but fine'ly he cotch her down by de spring one day, en sezee:--

"'Dilsey, w'at fer yer won' speak ter me, en purten' lack yer doan see me? Dilsey, yer knows me too well fer ter b'lieve I'd steal, er do dis yuther wick'ness de niggers is all layin' ter me,--yer KNOWS I wouldn' do dat, Dilsey. Yer ain' gwine back on yo' Dave, is yer?'

"But w'at Dave say didn' hab no 'fec' on Dilsey. Dem lies folks b'en tellin' her had p'isen' her min' 'g'in' Dave.

"'I doan wanter talk ter no nigger,' says she, 'w'at be'n whip' fer stealin', en w'at gwine roun' wid sich a lookin' thing ez dat hung roun' his neck. I's a 'spectable gal, I is. W'at yer call dat, Dave? Is dat a cha'm fer ter keep off witches, er is it a noo kine er neckliss yer got?'

"Po' Dave didn' knowed w'at ter do. De las' one he had 'pended on fer ter stan' by 'im had gone back on 'im, en dey didn' 'pear ter be nuffin mo' wuf libbin' fer. He couldn' hol' no mo' pra'r-meetin's, fer Mars Walker wouldn' 'low 'im ter preach, en de darkies wouldn' 'a' listen' ter 'im ef he had preach'. He didn' eben hab his Bible fer ter comfort hisse'f wid, fer Mars Walker had tuk it erway fum 'im en burnt it up, en say ef he ketch any mo' niggers wid Bibles on de plantation he'd do 'em wuss'n he done Dave.

"En ter make it still harder fer Dave, Dilsey tuk up wid Wiley. Dave could see him gwine up ter Aun' Mahaly's cabin, en settin' out on de bench in de moonlight wid Dilsey, en singin' sinful songs en playin' de banjer. Dave use' ter scrouch down behine de bushes, en wonder w'at de Lawd sen' 'im all dem tribberlations fer.

"But all er Dave's yuther troubles wa'n't nuffin side er dat ham. He had wrap' de chain roun' wid a rag, so it didn' hurt his neck; but w'eneber he went ter wuk, dat ham would be in his way; he had ter do his task, howsomedever, des de same ez ef he didn' hab de ham. W'eneber he went ter lay down, dat ham would be in de way. Ef he turn ober in his sleep, dat ham would be tuggin' at his neck. It wuz de las' thing he seed at night, en de fus' thing he seed in de mawnin'. W'eneber he met a stranger, de ham would be de fus' thing de stranger would see. Most un 'em would 'mence' ter laf, en whareber Dave went he could see folks p'intin' at him, en year 'em sayin:--

"'W'at kine er collar dat nigger got roun' his neck?' er, ef dey knowed 'im, 'Is yer stole any mo' hams lately?' er 'W'at yer take fer yo' neckliss, Dave?' er some joke er 'nuther 'bout dat ham.

"Fus' Dave didn' mine it so much, caze he knowed he hadn' done nuffin. But bimeby he got so he couldn' stan' it no longer, en he'd hide hisse'f in de bushes w'eneber he seed anybody comin', en alluz kep' hisse'f shet up in his cabin atter he come in fum wuk.

"It wuz monst'us hard on Dave, en bimeby, w'at wid dat ham eberlastin' en etarnally draggin' roun' his neck, he 'mence' fer ter do en say quare things, en make de niggers wonder ef he wa'n't gittin' out'n his mine. He got ter gwine roun' talkin' ter hisse'f, en singin' corn-shuckin' songs, en laffin' fit ter kill 'bout nuffin. En one day he tole one er de niggers he had 'skivered a noo way fer ter raise hams,--gwine ter pick 'em off'n trees, en save de expense er smoke-'ouses by kyoin' 'em in de sun. En one day he up'n tole Mars Walker he got sump'n pertickler fer ter say ter 'im; en he tuk Mars Walker off ter one side, en tole 'im he wuz gwine ter show 'im a place in de swamp whar dey wuz a whole trac' er lan' covered wid ham-trees.

"W'en Mars Walker hearn Dave talkin' dis kine er fool-talk, en w'en he seed how Dave wuz 'mencin' ter git behine in his wuk, en w'en he ax' de niggers en dey tole 'im how Dave be'n gwine on, he 'lowed he reckon' he'd punish' Dave ernuff, en it mou't do mo' harm dan good fer ter keep de ham on his neck any longer. So he sont Dave down ter de blacksmif-shop en had de ham tak off.

Dey wa'n't much er de ham lef' by dat time, fer de sun had melt all de fat, en de lean had all swivel' up, so dey wa'n't but th'ee er fo' poun's lef'.

"W'en de ham had be'n tuk off'n Dave, folks kinder stopped talkin' 'bout 'im so much. But de ham had be'n on his neck so long dat Dave had sorter got use' ter it. He look des lack he'd los' sump'n fer a day er so atter de ham wuz tuk off, en didn' 'pear ter know w'at ter do wid hisse'f; en fine'ly he up'n tuk'n tied a lightered-knot ter a string, en hid it under de flo' er his cabin, en w'en nobody wuzn' lookin' he'd take it out en hang it roun' his neck, en go off in de woods en holler en sing; en he allus tied it roun' his neck w'en he went ter sleep. Fac', it 'peared lack Dave done gone clean out'n his mine. En atter a w'ile he got one er de quarest notions you eber hearn tell un. It wuz 'bout dat time dat I come back ter de plantation fer ter wuk,--I had be'n out ter Mars Dugal's yuther place on Beaver Crick for a mont' er so. I had hearn 'bout Dave en de bacon, en 'bout w'at wuz gwine on on de plantation; but I didn' b'lieve w'at dey all say 'bout Dave, fer I knowed Dave wa'n't dat kine er man. One day atter I come back, me'n Dave wuz choppin' cotton tergedder, w'en Dave lean' on his hoe, en motion' fer me ter come ober close ter 'im; en den he retch' ober en w'ispered ter me.

"'Julius', [sic] sezee, 'did yer knowed yer wuz wukkin' long yer wid a ham?'

"I couldn 'magine w'at he meant. 'G'way fum yer, Dave,' says I. 'Yer ain' wearin' no ham no mo'; try en fergit 'bout dat; 't ain' gwine ter do yer no good fer ter 'member it.'

"Look a-yer, Julius,' sezee, 'kin yer keep a secret?'

"'Co'se I kin, Dave,' says I. 'I doan go roun' tellin' people w'at yuther folks says ter me.'

"'Kin I trus' yer, Julius? Will yer cross yo' heart?'

"I cross' my heart. 'Wush I may die ef I tells a soul,' says I.

"Dave look' at me des lack he wuz lookin' thoo me en 'way on de yuther side er me, en sezee:--

"'Did yer knowed I wuz turnin' ter a ham, Julius?'

"I tried ter 'suade Dave dat dat wuz all foolishness, en dat he oughtn't ter be talkin' dat-a-way,--hit wa'n't right. En I tole 'im ef he'd des be patien', de time would sho'ly come w'en eve'ything would be straighten' out, en folks would fine out who de rale rogue wuz w'at stole de bacon. Dave 'peared ter listen ter w'at I say, en promise' ter do better, en stop gwine on dat-a-way; en it seem lack he pick' up a bit w'en he seed dey wuz one pusson didn' b'lieve dem tales 'bout 'im.

"Hit wa'n't long atter dat befo' Mars Archie McIntyre, ober on de Wimbleton road, 'mence' ter complain 'bout somebody stealin' chickens fum his hen-'ouse. De chickens kip' on gwine, en at las' Mars Archie tole de han's on his plantation dat he gwine ter shoot de fus' man he ketch in his hen-'ouse. In less'n a week atter he gin dis warnin', he cotch a nigger in de hen-'ouse, en fill' 'im full er squir'l-shot. W'en he got a light, he 'skivered it wuz a strange nigger; en w'en he call' one er his own sarven's, de nigger tole 'im it wuz our Wiley. W'en Mars Archie foun' dat out, he sont ober ter our plantation fer ter tell Mars Dugal' he had shot one er his niggers, en dat he could sen' ober dere en git w'at wuz lef' un 'im.

"Mars Dugal' wuz mad at fus'; but w'en he got ober dere en hearn how it all happen', he didn' hab much ter say. Wiley wuz shot so bad he wuz sho' he wuz gwine ter die, so he up'n says ter ole marster:--

"'Mars Dugal',' sezee, 'I knows I's be'n a monst'us bad nigger, but befo' I go I wanter git sump'n off'n my mine. Dave didn' steal dat bacon w'at wuz tuk out'n de smoke-'ouse. I stole it all, en I hid de ham under Dave's cabin fer ter th'ow de blame on him--en may de good Lawd fergib me fer it.'

"Mars Dugal' had Wiley tuk back ter de plantation, en sont fer a doctor fer ter pick de shot out'n 'im. En de ve'y nex' mawnin' Mars Dugal' sont fer Dave ter come up ter de big house; he felt kinder sorry fer de way Dave had be'n treated. Co'se it wa'n't no fault er Mars Dugal's, but he wuz gwine ter do w'at he could fer ter make up fer it. So he sont word down ter de quarters fer Dave en all de yuther han's ter 'semble up in de yard befo' de big house at sun-up nex' mawnin'.

"Yearly in de mawnin' de niggers all swarm' up in de yard. Mars Dugal' wuz feelin' so kine dat he had brung up a bairl er cider, en tole de niggers all fer ter he'p deyselves.

"All dey han's on de plantation come but Dave; en bimeby, w'en it seem lack he wa'n't comin', Mars Dugal' sont a nigger down ter de quarters ter look fer 'im. De sun wuz gittin' up, en dey wuz a heap er wuk ter be done, en Mars Dugal' sorter got ti'ed waitin'; so he up'n says:--

"'Well, boys en gals, I sont fer yer all up yer fer ter tell yer dat all dat 'bout Dave's stealin' er de bacon wuz a mistake, ez I s'pose yer all done hearn befo' now, en I's mighty sorry it happen'. I wants ter treat all my niggers right, en I wants yer all ter know dat I sets a heap by all er my han's w'at is hones' en smart. En I want yer all ter treat Dave des lack yer did befo' dis thing happen', en mine w'at he preach ter yer; fer Dave is a good nigger, en has had a hard row ter hoe. En de fus' one I ketch sayin' anythin' 'g'in Dave, I'll tell Mister Walker ter gin 'im forty. Now take ernudder drink er cider all roun', en den git at dat cotton, fer I wanter git dat Persimmon Hill trac' all pick' ober ter-day.'

"W'en de niggers wuz gwine 'way, Mars Dugal' tole me fer ter go en hunt up Dave, en bring 'im up ter de house. I went down ter Dave's cabin, but couldn' fine 'im dere. Den I look' roun' de plantation, en in de aidge er de woods, en 'long de road; but I couldn' fine no sign er Dave. I wuz 'bout ter gin up de sarch, w'en I happen' fer ter run 'cross a foot-track w'at look' lack Dave's. I had wukked 'long wid Dave so much dat I knowed his tracks: he had a monst'us long foot, wid a holler instep, w'ich wuz sump'n skase 'mongs' black folks. So I follered dat track 'cross de fiel' fum de quarters 'tel I got ter de smoke-'ouse. De fus' thing I notice' wuz smoke comin' out'n de cracks: it wuz cu'ous, caze dey hadn' be'n no hogs kill' on de plantation fer six mont' er so, en all de bacon in de smoke-'ouse wuz done kyoed. I couldn' 'magine fer ter sabe my life w'at Dave wuz doin' in dat smoke-'ouse. I went up ter de do' en hollered:--

"'Dave!'

"Dey didn' nobody answer. I didn' wanter open de do', fer w'ite folks is monst'us pertickler 'bout dey smoke-'ouses; en ef de oberseah had a-come up en cotch me in dere, he mou't not wanter b'lieve I wuz des lookin' fer Dave. So I sorter knock at de do' en call' out ag'in:--

"'O Dave, hit's me--Julius! Doan be skeered. Mars Dugal' wants yer ter come up ter de big house,--he done 'skivered who stole de ham.'

"But Dave didn' answer. En w'en I look' roun' ag'in en didn' seed none er his tracks gwine way fum de smoke-'ouse, I knowed he wuz in dere yit, en I wuz 'termine' fer ter fetch 'im out; so I push de do' open en look in.

"Dey wuz a pile er bark burnin' in de middle er de flo', en right ober de fier, hangin' fum one er de rafters, wuz Dave; dey wuz a rope roun' his neck, en I didn' haf ter look at his face mo' d'n once fer ter see he wuz dead.

"Den I knowed how it all happen'. Dave had kep' on gittin' wusser en wusser in his mine, 'tel he des got ter b'lievin' he wuz all done turnt ter a ham; en den he had gone en built a fier, en tied a rope roun' his neck, des lack de hams wuz tied, en had hung hisse'f up in de smoke-'ouse fer ter kyo.

"Dave wuz buried down by de swamp, in de plantation buryin'-groun'. Wiley didn' died fum de woun' he got in Mars McIntyre's hen-'ouse; he got well atter a w'ile, but Dilsey wouldn' hab nuffin mo' ter do wid 'im, en 't wa'n't long 'fo' Mars Dugal' sol' 'im ter a spekilater on his way souf,--he say he didn' want no sich a nigger on de plantation, ner in de county, ef he could he'p it. En w'en de een' er de year come, Mars Dugal' turnt Mars Walker off, en run de plantation hisse'f atter dat.

"Eber sence den," said Julius in conclusion, "w'eneber I eats ham, it min's me er Dave. I lacks ham, but I nebber kin eat mo' d'n two er th'ee poun's befo' I gits ter studyin' 'bout Dave, en den I has ter stop en leab de res' fer ernudder time."

There was a short silence after the old man had finished his story, and then my wife began to talk to him about the weather, on which subject he was an authority. I went into the house. When I came out, half an hour later, I saw Julius disappearing down the lane, with a basket on his arm.

At breakfast, next morning, it occurred to me that I should like a slice of ham. I said as much to my wife.

"Oh, no, John," she responded, "you shouldn't eat anything so heavy for breakfast."

I insisted.

"The fact is," she said, pensively, "I couldn't have eaten any more of that ham, and so I gave it to Julius."

THE AWAKENING OF THE NEGRO by Booker T. Washington

When a mere boy, I saw a young colored man, who had spent several years in school, sitting in a common cabin in the South, studying a French grammar. I noted the poverty, the untidiness, the want of system and thrift, that existed about the cabin, notwithstanding his knowledge of French and other academic subjects. Another time, when riding on the outer edges of a town in the South, I heard the sound of a piano coming from a cabin of the same kind. Contriving some excuse, I entered, and began a conversation with the young colored woman who was playing, and who had recently returned from a boarding-school, where she had been studying instrumental music among other things. Despite the fact that her parents were living in a rented cabin, eating poorly cooked food, surrounded with poverty, and having almost none of the conveniences of life, she had persuaded them to rent a piano for four or five dollars per month. Many such instances as these, in connection with my own struggles, impressed upon me the importance of making a study of our needs as a race, and applying the remedy accordingly.

Some one may be tempted to ask, Has not the negro boy or girl as good a right to study a French grammar and instrumental music as the white youth? I answer, Yes, but in the present condition of the negro race in this country there is need of something more. Perhaps I may be forgiven for the seeming egotism if I mention the expansion of my own life partly as an example of what I mean. My earliest recollection is of a small one-room log hut on a large slave plantation in Virginia. After the close of the war, while working in the coal-mines of West Virginia for the support of my mother, I heart in some accidental way of the Hampton Institute. When I learned that it was an institution where a black boy could study, could have a chance to work for his board, and at the same time be taught how to work and to realize the dignity of labor, I resolved to go there. Bidding my mother good-by, I started out one morning to find my way to Hampton, though I was almost penniless and had no definite idea where Hampton was. By walking, begging rides, and paying for a portion of the journey on the steam-cars, I finally succeeded in reaching the city of Richmond, Virginia. I was without money or friends. I slept under a sidewalk, and by working on a vessel next day I earned money to continue my way to the institute, where I arrived with a surplus of fifty cents. At Hampton I found the opportunity--in the way of buildings, teachers, and industries provided by the generous--to get training in the class-room and by practical touch with industrial life, to learn thrift, economy, and push. I was surrounded by an atmosphere of business, Christian influence, and a spirit of self-help that seemed to have awakened every faculty in me, and caused me for the first time to realize what it meant to be a man instead of a piece of property.

While there I resolved that when I had finished the course of training I would go into the far South, into the Black Belt of the South, and give my life to providing the same kind of opportunity for self-reliance and self-awakening that I had found provided for me at Hampton. My work began at Tuskegee, Alabama, in 1881, in a small shanty and church, with one teacher and thirty students, without a dollar's worth of property. The spirit of work and of industrial thrift, with aid from the State and generosity from the North, has enabled us to develop an institution of eight hundred students gathered from nineteen States, with seventy-nine instructors, fourteen hundred acres of land, and thirty buildings, including large and small; in all, property valued at $280,000. Twenty-five industries have been organized, and the whole work is carried on at an annual cost of about $80,000 in cash; two fifths of the annual expense so far has gone into permanent plant.

What is the object of all this outlay? First, it must be borne in mind that we have in the South a peculiar and unprecedented state of things. It is of the utmost importance that our energy be given to meeting conditions that exist right about us rather than conditions that existed centuries ago or that exist in countries a thousand miles away. What are the cardinal needs among the seven millions of colored people in the South, most of whom are to be found on the plantations? Roughly, these needs may be stated as food, clothing, shelter, education, proper habits, and a settlement of race relations. The seven millions of colored people of the South cannot be reached directly by any missionary agency, but they can be reached by sending out among them strong selected young men and women, with the proper training of head, hand, and heart, who will live among these masses and show them how to lift themselves up.

The problem that the Tuskegee Institute keeps before itself constantly is how to prepare these leaders. From the outset, in connection with religious and academic training, it has emphasized industrial or hand training as a means of finding the way out of present conditions. First, we have found the industrial teaching useful in giving the student a chance to work out a portion of his expenses while in school. Second, the school furnishes labor that has an economic value, and at the same time gives the student a chance to acquire knowledge and skill while performing the labor. Most of all, we find the industrial system valuable in teaching economy, thrift, and the dignity of labor, and in giving moral backbone to students. The fact that a student goes out into the world conscious of his power to build a house or a wagon, or to make a harness, gives him a certain confidence and moral independence

that he would not possess without such training.

A more detailed example of our methods at Tuskegee may be of interest. For example, we cultivate by student labor six hundred and fifty acres of land. The object is not only to cultivate the land in a way to make it pay our boarding department, but at the same time to teach the students, in addition to the practical work, something of the chemistry of the soil, the best methods of drainage, dairying, the cultivation of fruit, the care of livestock and tools, and scores of other lessons needed by a people whose main dependence is on agriculture. Notwithstanding that eighty-five per cent of the colored people in the South live by agriculture in some form, aside from what has been done by Hampton, Tuskegee, and one or two other institutions practically nothing has been attempted in the direction of teaching them about the very industry from which the masses of our people must get their subsistence. Friends have recently provided means for the erection of a large new chapel at Tuskegee. Our students have made the bricks for this chapel. A large part of the timber is sawed by students at our own sawmill, the plans are drawn by our teacher of architecture and mechanical drawing, and students do the brick-masonry, plastering, painting, carpentry work, tinning, slating, and make most of the furniture. Practically, the whole chapel will be built and furnished by student labor; in the end the school will have the building for permanent use, and the students will have a knowledge of the trades employed in its construction. In this way all but three of the thirty buildings on the grounds have been erected. While the young men do the kinds of work I have mentioned, the young women to a large extent make, mend, and launder the clothing of the young men, and thus are taught important industries.

One of the objections sometimes urged against industrial education for the negro is that it aims merely to teach him to work on the same plan that he was made to follow when in slavery. This is far from being the object at Tuskegee. At the head of each of the twenty-five industrial departments we have an intelligent and competent instructor, just as we have in our history classes, so that the student is taught not only practical brick-masonry, for example, but also the underlying principles of that industry, the mathematics and the mechanical and architectural drawing. Or he is taught how to become master of the forces of nature so that, instead of cultivating corn in the old way, he can use a corn cultivator, that lays off the furrows, drops the corn into them, and covers it, and in this way he can do more work than three men by the old process of corn-planting; at the same time much of the toil is eliminated and labor is dignified. In a word, the constant aim is to show the student how to put brains into every process of labor; how to bring his knowledge of mathematics and the sciences into farming, carpentry, forging, foundry work; how to dispense as soon as possible with the old form of ante-bellum labor. In the erection of the chapel just referred to, instead of letting the money which was given us go into outside hands, we make it accomplish three objects: first, it provides the chapel; second, it gives the students a chance to get a practical knowledge of the trades connected with building; and third, it enables them to earn something toward the payment of board while receiving academic and industrial training.

Having been fortified at Tuskegee by education of mind, skill of hand, Christian character, ideas of thrift, economy, and push, and a spirit of independence, the student is sent out to become a centre of influence and light in showing the masses of our people in the Black Belt of the South how to lift themselves up. How can this be done? I give but one or two examples. Ten years ago a young colored man came to the institute from one of the large plantation districts; he studied in the class-room a portion of the time, and received practical and theoretical training on the farm the remainder of the time. Having finished his course at Tuskegee, he returned to his plantation home, which was in a county where the colored people outnumber the whites six to one, as is true of many of the counties in the Black Belt of the South. He found the negroes in debt. Ever since the war they had been mortgaging their crops for the food on which to live while the crops were growing. The majority of them were living from hand to mouth on rented land, in small, one-room log cabins, and attempting to pay a rate of interest on their advances that ranged from fifteen to forty per cent per annum. The school had been taught in a wreck of a log cabin, with no apparatus, and had never been in session longer than three months out of twelve. With as many as eight or ten persons of all ages and conditions and of both sexes huddled together in one cabin year after year, and with a minister whose only aim was to work upon the emotions of the people, one can imagine something of the moral and religious state of the community.

But the remedy. In spite of the evil, the negro got the habit of work from slavery. The rank and file of the race, especially those on the Southern plantations, work hard, but the trouble is, what they earn gets away from them in high rents, crop mortgages, whiskey, snuff, cheap jewelry, and the like. The young man just referred to had been trained at Tuskegee, as most of our graduates are, to meet just this condition of things. He took the three months' public school as a nucleus for his work. Then he organized the older people into a club, or conference, that held meetings every week. In these meetings he taught the people in a plain, simple manner how to save their money, how to farm in a better way, how to sacrifice,--to live on bread and potatoes, if need be, till they could get out of debt, and begin the buying of lands.

Soon a large proportion of the people were in condition to make contracts for the buying of homes (land is very cheap in the South), and to live without mortgaging their crops. Not only this: under the guidance and leadership of this teacher, the first year that he was among them they learned how, by contributions in money and labor, to build a neat, comfortable schoolhouse that replaced the wreck of a log cabin formerly used. The following year the weekly meetings were continued, and two months were added to the original three months of school. The next year two more months were added. The improvement has gone on, until now these people have every year an eight months' school.

I wish my readers could have the chance that I have had of going into this community. I wish they could look into the faces of the people and see them beaming with hope and delight. I wish they could see the two or three room cottages that have taken the place of the usual one-room cabin, the well-cultivated farms, and the religious life of the people that now means something more than the name. The teacher has a good cottage and a well-kept farm that serve as models. In a word, a complete revolution has been wrought in the industrial, educational, and religious life of this whole community by reason of the fact that they have had this leader, this guide and object-lesson, to show them how to take the money and effort that had hitherto been scattered to the wind in mortgages and high rents, in whiskey and gewgaws, and concentrate them in the direction of their own uplifting. One community on its feet presents an object-lesson for the adjoining communities, and soon improvements show themselves in other places.

Another student who received academic and industrial training at Tuskegee established himself, three years ago, as a blacksmith and wheelwright in a community, and, in addition to the influence of his successful business enterprise, he is fast making the same kind of changes in the life of the people about him that I have just recounted. It would be easy for me to fill many pages describing the influence of the Tuskegee graduates in every part of the South. We keep it constantly in the minds of our students and graduates that the industrial or material condition of the masses of our people must be improved, as well as the intellectual, before there can be any permanent change in their moral and religious life. We find it a pretty hard thing to make a good Christian of a hungry man. No matter how much our people "get happy" and "shout" in church, if they go home at night from church hungry, they are tempted to find something before morning. This is a principle of human nature, and is not confined to the negro.

The negro has within him immense power for self-uplifting, but for years it will be necessary to guide and stimulate him. The recognition of this power led us to organize, five years ago, what is now known as the Tuskegee Negro Conference,--a gathering that meets every February, and is composed of about eight hundred representative colored men and women from all sections of the Black Belt. They come in ox-carts, mule-carts, buggies, on muleback and horseback, on foot, by railroad: some traveling all night in order to be present. The matters considered at the conferences are those that the colored people have it within their own power to control: such as the evils of the mortgage system, the one-room cabin, buying on credit, the importance of owning a home and of putting money in the bank, how to build schoolhouses and prolong the school term, and how to improve their moral and religious condition.

As a single example of the results, one delegate reported that since the conferences were started five years ago eleven people in his neighborhood had bought homes, fourteen had got out of debt, and a number had stopped mortgaging their crops. Moreover, a schoolhouse had been built by the people themselves, and the school term had been extended from three to six months; and with a look of triumph he exclaimed, "We is done stopped libin' in de ashes!"

Besides this Negro Conference for the masses of the people, we now have a gathering at the same time known as the Workers' Conference, composed of the officers and instructors in the leading colored schools of the South. After listening to the story of the conditions and needs from the people themselves, the Workers' Conference finds much food for thought and discussion.

Nothing else so soon brings about right relations between the two races in the South as the industrial progress of the negro. Friction between the races will pass away in proportion as the black man, by reason of his skill, intelligence, and character, can produce something that the white man wants or respects in the commercial world. This is another reason why at Tuskegee we push the industrial training. We find that as every year we put into a Southern community colored men who can start a brick-yard, a sawmill, a tin-shop, or a printing-office,--men who produce something that makes the white man partly dependent upon the negro, instead of all the dependence being on the other side,--a change takes place in the relations of the races.

Let us go on for a few more years knitting our business and industrial relations into those of the white man, till a black man gets a mortgage on a white man's house that he can foreclose at will. The white man on whose house the mortgage rests will not try to prevent that negro from voting when he goes to the polls. It is through the dairy farm, the truck garden, the trades, and commercial life, largely, that the negro is to find his way to the enjoyment of all his rights. Whether he will or not, a white man respects a negro

who owns a two-story brick house.

What is the permanent value of the Tuskegee system of training to the South in a broader sense? In connection with this, it is well to bear in mind that slavery taught the white man that labor with the hands was something fit for the negro only, and something for the white man to come into contact with just as little as possible. It is true that there was a large class of poor white people who labored with the hands, but they did it because they were not able to secure negroes to work for them; and these poor whites were constantly trying to imitate the slave-holding class in escaping labor, and they too regarded it as anything but elevating. The negro in turn looked down upon the poor whites with a certain contempt because they had to work. The negro, it is to be borne in mind, worked under constant protest, because he felt that his labor was being unjustly required, and he spent almost as much effort in planning how to escape work as in learning how to work. Labor with him was a badge of degradation. The white man was held up before him as the highest type of civilization, but the negro noted that this highest type of civilization himself did no labor; hence he argued that the less work he did, the more nearly he would be like a white man. Then, in addition to these influences, the slave system discouraged labor-saving machinery. To use labor-saving machinery intelligence was required, and intelligence and slavery were not on friendly terms; hence the negro always associated labor with toil, drudgery, something to be escaped. When the negro first became free, his idea of education was that it was something that would soon put him in the same position as regards work that his recent master had occupied. Out of these conditions grew the Southern habit of putting off till to-morrow and the day after the duty that should be done promptly to-day. The leaky house was not repaired while the sun shone, for then the rain did not come through. While the rain was falling, no one cared to expose himself to stop the leak. The plough, on the same principle, was left where the last furrow was run, to rot and rust in the field during the winter. There was no need to repair the wooden chimney that was exposed to the fire, because water could be thrown on it when it was on fire. There was no need to trouble about the payment of a debt to-day, for it could just as well be paid next week or next year. Besides these conditions, the whole South, at the close of the war, was without proper food, clothing, and shelter,--was in need of habits of thrift and economy and of something laid up for a rainy day.

To me it seemed perfectly plain that here was a condition of things that could not be met by the ordinary process of education. At Tuskegee we became convinced that the thing to do was to make a careful systematic study of the condition and needs of the South, especially the Black Belt, and to bend our efforts in the direction of meeting these needs, whether we were following a well-beaten track, or were hewing out a new path to meet conditions probably without a parallel in the world. After fourteen years of experience and observation, what is the result? Gradually but surely, we find that all through the South the disposition to look upon labor as a disgrace is on the wane, and the parents who themselves sought to escape work are so anxious to give their children training in intelligent labor that every institution which gives training in the handicrafts is crowded, and many (among them Tuskegee) have to refuse admission to hundreds of applicants. The influence of the Tuskegee system is shown again by the fact that almost every little school at the remotest cross-roads is anxious to be known as an industrial school, or, as some of the colored people call it, an "industrus" school.

The social lines that were once sharply drawn between those who labored with the hand and those who did not are disappearing. Those who formerly sought to escape labor, now when they see that brains and skill rob labor of the toil and drudgery once associated with it, instead of trying to avoid it are willing to pay to be taught how to engage in it. The South is beginning to see labor raised up, dignified and beautified, and in this sees its salvation. In proportion as the love of labor grows, the large idle class which has long been one of the curses of the South disappears. As its members become absorbed in occupations, they have less time to attend to everybody else's business, and more time for their own.

The South is still an undeveloped and unsettled country, and for the next half century and more the greater part of the energy of the masses will be needed to develop its material opportunities. Any force that brings the rank and file of the people to a greater love of industry is therefore especially valuable. This result industrial education is surely bringing about. It stimulates production and increases trade,--trade between the races,--and in this new and engrossing relation both forget the past. The white man respects the vote of the colored man who does $10,000 worth of business, and the more business the colored man has, the more careful he is how he votes.

Immediately after the war, there was a large class of Southern people who feared that the opening of the free schools to the freedmen and the poor whites--the education of the head alone--would result merely in increasing the class who sought to escape labor, and that the South would soon be overrun by the idle and vicious. But as the results of industrial combined with academic training begin to show themselves in hundreds of communities that have been lifted up through the medium of the Tuskegee system, these former prejudices against education are being removed. Many of those who a few years ago opposed general

education are now among its warmest advocates.

This industrial training, emphasizing as it does the idea of economic production, is gradually bringing the South to the point where it is feeding itself. Before the war, and long after it, the South made what little profit was received from the cotton crop, and sent its earnings out of the South to purchase food supplies,--meat, bread, canned vegetables, and the like; but the improved methods of agriculture are fast changing this habit. With the newer methods of labor, which teach promptness and system, and emphasize the worth of the beautiful,--the moral value of the well-painted house, and the fence with every paling and nail in its place,--we are bringing to bear upon the South an influence that is making it a new country in industry, education, and religion.

THE STORY OF UNCLE TOM'S CABIN by Charles Dudley Warner

On the 29th of June, 1852, Henry Clay died. In that month the two great political parties, in their national conventions, had accepted as a finality all the compromise measures of 1850, and the last hours of the Kentucky statesman were brightened by the thought that his efforts had secured the perpetuity of the Union.

But on the 20th of March, 1852, there had been an event, the significance of which was not taken into account by the political conventions or by Clay, which was to test the conscience of the nation. This was the publication of Uncle Tom's Cabin. Was this only an "event," the advent of a new force in politics; was the book merely an abolition pamphlet, or was it a novel, one of the few great masterpieces of fiction that the world has produced? After the lapse of forty-four years and the disappearance of African slavery on this continent, it is perhaps possible to consider this question dispassionately.

The compromise of 1850 satisfied neither the North nor the South. The admission of California as a free State was regarded by Calhoun as fatal to the balance between the free and the slave States, and thereafter a fierce agitation sprang up for the recovery of this loss of balance, and ultimately for Southern preponderance, which resulted in the repeal of the Missouri Compromise, the Kansas-Nebraska war, and the civil war. The fugitive slave law was hateful to the North not only because it was cruel and degrading, but because it was seen to be a move formed for nationalizing slavery. It was unsatisfactory to the South because it was deemed inadequate in its provisions, and because the South did not believe the North would execute it in good faith. So unstable did the compromise seem that in less than a year after the passage of all its measures, Henry Clay and forty-four Senators and Representatives united in a manifesto declaring that they would support no man for office who was not known to be opposed to any disturbance of the settlements of the compromise. When, in February, 1851, the recaptured fugitive slave, Burns, was rescued from the United States officers in Boston, Clay urged the investment of the President with extraordinary power to enforce the law.

Henry Clay was a patriot, a typical American. The republic and its preservation were the passions of his life. Like Lincoln, who was born in the State of his adoption, he was willing to make almost any sacrifice for the maintenance of the Union. He had no sympathy with the system of slavery. There is no doubt that he would have been happy in the belief that it was in the way of gradual and peaceful extinction. With him, it was always the Union before state rights and before slavery. Unlike Lincoln, he had not the clear vision to see that the republic could not endure half slave and half free. He believed that the South, appealing to the compromises of the Constitution, would sacrifice the Union before it would give up slavery, and in fear of this menace he begged the North to conquer its prejudices. We are not liable to overrate his influence as a compromising pacificator from 1832 to 1852. History will no doubt say that it was largely due to him that the war on the Union was postponed to a date when its success was impossible.

It was the fugitive slave law that brought the North face to face with slavery nationalized, and it was the fugitive slave law that produced Uncle Tom's Cabin. The effect of this story was immediate and electric. It went straight to the hearts of tens of thousands of people who had never before considered slavery except as a political institution for which they had no personal responsibility. What was this book, and how did it happen to produce such an effect? It is true that it struck into a time of great irritation and agitation, but in one sense there was nothing new in it. The facts had all been published. For twenty years abolition tracts, pamphlets, newspapers, and books had left little to be revealed, to those who cared to read, as to the nature of slavery or its economic aspects. The evidence was practically all in,--supplied largely by the advertisements of Southern newspapers and by the legislation of the slaveholding States,--but it did not carry conviction; that is, the sort of conviction that results in action. The subject had to be carried home to the conscience. Pamphleteering, convention-holding, sermons, had failed to do this. Even the degrading requirements of the fugitive slave law, which brought shame and humiliation, had not sufficed to fuse the public conscience, emphasize the necessity of obedience to the moral law, and compel recognition of the responsibility of the North for slavery. Evidence had not done this, passionate appeals had not done it, vituperation had not done it. What sort of presentation of the case

would gain the public ear and go to the heart? If Mrs. Stowe, in all her fervor, had put forth first the facts in The Key to Uncle Tom's Cabin, which so buttressed her romance, the book would have had no more effect than had followed the like compilations and arraignments. What was needed? If we can discover this, we shall have the secret of this epoch-making novel.

The story of this book has often been told. It is in the nature of a dramatic incident of which the reader never tires any more than the son of Massachusetts does of the minutest details of that famous scene in the Senate Chamber when Webster replied to Hayne.

At the age of twenty-four the author was married and went to live in Cincinnati, where her husband held a chair in the Lane Theological Seminary. There for the first time she was brought into relations with the African race and saw the effects of slavery. She visited slaveholders in Kentucky and had friends among them. In some homes she saw the "patriarchal" institution at its best. The Beecher family were anti-slavery, but they had not been identified with the abolitionists, except perhaps Edward, who was associated with the murdered Lovejoy. It was long a reproach brought by the abolitionists against Henry Ward Beecher that he held entirely aloof from their movement. At Cincinnati, however, the personal aspects of the case were brought home to Mrs. Stowe. She learned the capacities and peculiarities of the negro race. They were her servants; she taught some of them; hunted fugitives applied to her; she ransomed some by her own efforts; every day there came to her knowledge stories of the hunger for freedom, of the ruthless separation of man and wife and mother and child, and of the heroic sufferings of those who ran away from the fearful doom of those "sold down South." These things crowded upon her mind and awoke her deepest compassion. But what could she do against all the laws, the political and commercial interests, the great public apathy? Relieve a case here and there, yes. But to dwell upon the gigantic evil, with no means of making head against it, was to invite insanity.

As late as 1850, when Professor Stowe was called to Bowdoin College, and the family removed to Brunswick, Maine, Mrs. Stowe had not felt impelled to the duty she afterwards undertook. "In fact, it was a sort of general impression upon her mind, as upon that of many humane people in those days, that the subject was so dark and painful a one, so involved in difficulty and obscurity, so utterly beyond human hope or help, that it was of no use to read, or think, or distress one's self about it." But when she reached New England the excitement over the fugitive slave law was at its height. There was a panic in Boston among the colored people settled there, who were daily fleeing to Canada. Every mail brought her pitiful letters from Boston, from Illinois, and elsewhere, of the terror and despair caused by the law. Still more was the impressed by the apathy of the Christian world at the North, and surely, she said, the people did not understand what the "system" was. Appeals were made to her, who had some personal knowledge of the subject, to take up her pen. The task seemed beyond her in every way. She was not strong, she was in the midst of heavy domestic cares, with a young infant, with pupils to whom she was giving daily lessons, and the limited income of the family required the strictest economy. The dependence was upon the small salary of Professor Stowe, and the few dollars she could earn by an occasional newspaper or magazine article. But the theme burned in her mind, and finally took this shape: at least she would write some sketches and show the Christian world what slavery really was, and what the system was that they were defending. She wanted to do this with entire fairness, showing all the mitigations of the "patriarchal" system, and all that individuals concerned in it could do to alleviate its misery. While pondering this she came by chance, in a volume of an anti-slavery magazine, upon the authenticated account of the escape of a woman with her child on the ice across the Ohio River from Kentucky. She began to meditate. The faithful slave husband in Kentucky, who had refused to escape from a master who trusted him, when he was about to be sold "down river," came to her as a pattern of Uncle Tom, and the scenes of the story began to form themselves in her mind. "The first part of the book ever committed to writing [this is the statement of Mrs. Stowe] was the death of Uncle Tom. This scene presented itself almost as a tangible vision to her mind while sitting at the communion-table in the little church in Brunswick. She was perfectly overcome by it, and could scarcely restrain the convulsion of tears and sobbings that shook her frame. She hastened home and wrote it, and her husband being away, read it to her two sons of ten and twelve years of age. The little fellows broke out into convulsions of weeping, one of them saying through his sobs, 'Oh, mamma, slavery is the most cursed thing in the world!' From that time the story can less be said to have been composed by her than imposed upon her. Scenes, incidents, conversations rushed upon her with a vividness and importunity that would not be denied. The book insisted upon getting itself into being, and would take no denial."

When two or three chapters were written she wrote to her friend, Dr. Bailey, of Washington, the editor of The National Era, to which she had contributed, that she was planning a story that might run through several numbers of the Era. The story was at once applied for, and thereafter weekly installments were sent on regularly, in spite of all cares and distractions. The installments were mostly written during the morning, on a little desk in a corner of the dining-room of the cottage in Brunswick, subject to all the interruptions of house-keeping, her children bursting into the room continually with the importunity of childhood. But they did not break the spell or destroy her abstraction. With a smile and a word and a motion of the hand she would wave them off, and keep on

in her magician's work. Long afterwards they recalled this, dimly understood at the time, and wondered at her power of concentration. Usually at night the chapters were read to the family, who followed the story with intense feeling. The narrative ran on for nine months, exciting great interest among the limited readers of the Era, and gaining sympathetic words from the anti-slavery people, but without making any wide impression on the public.

We may pause here in the narrative to note two things: the story was not the work of a novice, and it was written out of abundant experience and from an immense mass of accumulated thought and material. Mrs. Stowe was in her fortieth year. She had been using her pen since she was twelve years old, in extensive correspondence, in occasional essays, in short stories and sketches, some of which appeared in a volume called The Mayflower, published in 1843, and for many years her writing for newspapers and periodicals had added appreciably to the small family income. She was in the maturity of her intellectual powers, she was trained in the art of writing, and she had, as Walter Scott had when he began the Waverley Novels at the age of forty-three, abundant store of materials on which to draw. To be sure, she was on fire with a moral purpose, but she had the dramatic instinct, and she felt that her object would not be reached by writing an abolition tract.

"In shaping her material the author had but one purpose, to show the institution of slavery truly, just as it existed. She had visited in Kentucky; had formed the acquaintance of people who were just, upright, and generous, and yet slave-holders. She had heard their views, and appreciated their situation; she felt that justice required that their difficulties should be recognized and their virtues acknowledged. It was her object to show that the evils of slavery were the inherent evils of a bad system, and not always the fault of those who had become involved in it and were its actual administrators. Then she was convinced that the presentation of slavery alone, in its most dreadful forms, would be a picture of such unrelieved horror and darkness as nobody could be induced to look at. Of set purpose, she sought to light up the darkness by humorous and grotesque episodes, and the presentation of the milder and more amusing phases of slavery, for which her recollection of the never-failing wit and drollery of her former colored friends in Ohio gave her abundant material."

This is her own account of the process, years after. But it is evident that, whether consciously or unconsciously, she did but follow the inevitable law of all great dramatic creators and true story-tellers since literature began.

For this story Mrs. Stowe received from the Era the sum of three hundred dollars. Before it was finished it attracted the attention of Mr. J. P. Jewett, of Boston, a young and then unknown publisher, who offered to issue it in book form. His offer was accepted, but as the tale ran on he became alarmed at its length, and wrote to the author that she was making the story too long for a one-volume novel; that the subject was unpopular; that people would not willingly hear much about it; that one short volume might possibly sell, but that if it grew to two that might prove a fatal obstacle to its success. Mrs. Stowe replied that she did not make the story, that the story made itself, and that she could not stop it till it was done. The publisher hesitated. It is said that a competent literary critic to whom he submitted it sat up all night with the novel, and then reported, "The story has life in it; it will sell." Mr. Jewett proposed to Professor Stowe to publish it on half profits if he would share the expenses. This offer was declined, for the Stowes had no money to advance, and the common royalty of ten per cent on the sales was accepted.

Mrs. Stowe was not interested in this business transaction. She was thinking only of having the book circulated for the effect she had at heart. The intense absorption in the story held her until the virtual end in the death of Uncle Tom, and then it seemed as if the whole vital force had left her. She sank into a profound discouragement. Would this appeal, which she had written with her heart's blood, go for nothing, as all the prayers and tears and strivings had already gone? When the last proof sheets left her hands, "it seemed to her that there was no hope; that nobody would read, nobody would pity; that this frightful system, which had already pursued its victims into the free States, might at last even threaten them in Canada." Resolved to leave nothing undone to attract attention to her cause, she wrote letters and ordered copies of her novel sent to men of prominence who had been known for their anti-slavery sympathies,--to Prince Albert, Macaulay, Charles Dickens, Charles Kingsley, and Lord Carlisle. Then she waited for the result.

She had not long to wait. The success of the book was immediate. Three thousand copies were sold the first day, within a few days ten thousand copies had gone, on the 1st of April a second edition went to press, and thereafter eight presses running day and night were barely able to keep pace with the demand for it. Within a year three hundred thousand copies were sold. No work of fiction ever spread more quickly throughout the reading community or awakened a greater amount of public feeling. It was read by everybody, learned and unlearned, high and low, for it was an appeal to universal human sympathy, and the kindling of this spread the book like wildfire. At first it seemed to go by acclamation. But this was not altogether owing to sympathy with the theme. I believe that it was its power as a novel that carried it largely. The community was generally apathetic when it was not hostile to any

real effort to be rid of slavery. This presently appeared. At first there were few dissenting voices from the chorus of praise. But when the effect of the book began to be evident it met with an opposition fiercer and more personal than the great wave of affectionate thankfulness which greeted it at first. The South and the defenders and apologists of slavery everywhere were up in arms. It was denounced in pulpit and in press, and some of the severest things were said of it at the North. The leading religious newspaper of the country, published in New York, declared that it was "anti-Christian."

Mrs. Stowe was twice astonished: first by its extraordinary sale, and second by the quarter from which the assault on it came. She herself says that her expectations were strikingly different from the facts. "She had painted slaveholders as amiable, generous, and just. She had shown examples among them of the noblest and most beautiful traits of character; had admitted fully their temptations, their perplexities, and their difficulties, so that a friend of hers who had many relatives in the South wrote to her: 'Your book is going to be the great pacificator; it will unite both North and South.' Her expectation was that the professed abolitionists would denounce it as altogether too mild in its dealings with slaveholders. To her astonishment, it was the extreme abolitionists who received, and the entire South who rose up against it."

There is something almost amusing in Mrs. Stowe's honest expectation that the deadliest blow the system ever suffered should have been received thankfully by those whose traditions, education, and interests were all bound up in it. And yet from her point of view it was not altogether unreasonable. Her blackest villain and most loathsome agent of the system, Legree, was a native of Vermont. All her wrath falls upon the slave-traders, the auctioneers, the public whippers, and the overseers, and all these persons and classes were detested by the Southerners to the point of loathing, and were social outcasts. The slave-traders and the overseers were tolerated as perhaps necessary in the system, but they were never admitted into respectable society. This feeling Mrs. Stowe regarded as a condemnation of the system.

Pecuniary reward was the last thing that Mrs. Stowe expected for her disinterested labor, but it suits the world's notion of the fitness of things that this was not altogether wanting. For the millions of copies of Uncle Tom scattered over the world the author could expect nothing, but in her own country her copyright yielded her a moderate return that lifted her out of poverty and enabled her to pursue her philanthropic and literary career. Four months after the publication of the book Professor Stowe was in the publisher's office, and Mr. Jewett asked him how much he expected to receive. "I hope," said Professor Stowe, with a whimsical smile, "that it will be enough to buy my wife a silk dress." The publisher handed him a check for ten thousand dollars.

Before Mrs. Stowe had a response to the letters accompanying the books privately sent to England, the novel was getting known there. Its career in Great Britain paralleled its success in America. In April a copy reached London in the hands of a gentleman who had taken it on the steamer to read. He gave it to Mr. Henry Vizetelly, who submitted it to Mr. David Bogue, a man known for his shrewdness and enterprise. He took a night to consider it, and then declined it, although it was offered to him for five pounds. A Mr. Gilpin also declined it. It was then submitted to Mr. Salisbury, a printer. This taster for the public sat up with the book till four o'clock in the morning, alternately weeping and laughing. Fearing, however, that this result was due to his own weakness, he woke up his wife, whom he describes as a rather strong-minded woman, and finding that the story kept her awake and made her also laugh and cry, he thought it might safely be printed. It seems, therefore, that Mr. Vizetelly ventured to risk five pounds, and the volume was brought out through the nominal agency of Clarke & Company. In the first week an edition of seven thousand was worked off. It made no great stir until the middle of June, but during July it sold at the rate of one thousand a week. By the 20th of August the demand for it was overwhelming. The printing firm was then employing four hundred people in getting it out, and seventeen printing-machines, besides hand-presses. Already one hundred and fifty thousand copies were sold. Mr. Vizetelly disposed of his interest, and a new printing firm began to issue monster editions. About this time the publishers awoke to the fact that any one was at liberty to reprint the book, and the era of cheap literature was initiated, founded on American reprints which cost the publisher no royalty. A shilling edition followed the one-and-sixpence, and then one complete for sixpence. As to the total sale, Mr. Sampson Low reports: "From April to December, 1852, twelve different editions (not reissues) were published, and within the twelve months of its first appearance eighteen different London publishing houses were engaged in supplying the great demand that had set in, the total number of editions being forty, varying from fine illustrated editions at 15s., 10s., and 7s. 6d. to the cheap popular editions of 1s. 9d. and 6d. After carefully analyzing these editions and weighing probabilities with ascertained facts, I am able pretty confidently to say that the aggregate number of copies circulated in Great Britain and the colonies exceeds one and a half millions." Later, abridgments were published.

Almost simultaneously with this furor in England the book made its way on the Continent. Several translations appeared in Germany and France, and for the authorized French edition Mrs. Stowe wrote a new preface, which served thereafter for most of the European editions. I find no record of the order of the translations of the book into foreign languages, but those into some of the

Oriental tongues did not appear till several years after the great excitement. The ascertained translations are into twenty-three tongues, namely: Arabic, Armenian, Chinese, Danish, Dutch, Finnish, Flemish, French, German, Hungarian, Illyrian, Italian, Japanese, Polish, Portuguese, modern Greek, Russian, Servian, Siamese, Spanish, Swedish, Wallachian, and Welsh. Into some of these languages several translations were made. In 1878 the British Museum contained thirty-five editions of the original text, and eight editions of abridgments or adaptations.

The story was dramatized in the United States in August, 1852, without the consent or knowledge of the author, and was played most successfully in the leading cities, and subsequently was acted in every capital in Europe. Mrs. Stowe had neglected to secure the dramatic rights, and she derived no benefit from the great popularity of a drama which still holds the stage. From the phenomenal sale of a book which was literally read by the whole world, the author received only the ten per cent on the American editions, and by the laws of her own country her copyright expired before her death.

The narrative of the rise and fortunes of this book would be incomplete without some reference to the response that the author received from England and the Continent, and of her triumphant progress through the British Isles. Her letters accompanying the special copies were almost immediately replied to, generally in terms of enthusiastic and fervent thankfulness for the book, and before midsummer her mail contained letters from all classes of English society. In some of them appeared a curious evidence of the English sensitiveness to criticism. Lord Carlisle and Sir Arthur Helps supplemented their admiration by a protest against the remark in the mouth of one of the characters that "slaves are better off than a large class of the population of England." This occurred in the defense of the institution by St. Clare, but it was treated by the British correspondents as the opinion of Mrs. Stowe. The charge was disposed of in Mrs. Stowe's reply: "The remark on that subject occurs in the dramatic part of the book, in the mouth of an intelligent Southerner. As a fair-minded person, bound to state for both sides all that could be said, in the person of St. Clare, the best that could be said on that point, and what I know IS in fact constantly reiterated, namely, that the laboring class of the South are in many respects, as to physical comfort, in a better condition than the poor in England. This is the slaveholder's stereo-typed apology; a defense it cannot be, unless two wrongs make one right."

In April, 1853, Mr. and Mrs. Stowe and the latter's brother, Charles Beecher, sailed for Europe. Her reception there was like a royal progress. She was met everywhere by deputations and addresses, and the enthusiasm her presence called forth was thoroughly democratic, extending from the highest in rank to the lowest. At Edinburgh there was presented to her a national penny offering, consisting of a thousand golden sovereigns on a magnificent silver salver, an unsolicited contribution in small sums by the people.

At a reception in Stafford House, London, the Duchess of Sutherland presented her with a massive gold bracelet, which has an interesting history. It is made of ten oval links in imitation of slave fetters. On two of the links were the inscriptions "March 25, 1807," the date of the abolition of the slave-trade, and "August 1, 1838," the date of the abolition of slavery in all British territory. The third inscription is "562,848--March 19, 1853," the date of the address of the women of England to the women of America on slavery, and the number of the women who signed. It was Mrs. Stowe's privilege to add to these inscriptions the following: "Emancipation D. C. Apl. 16, '62;" "President's Proclamation Jan. 1, '63;" "Maryland free Oct. 13, '64;" "Missouri free Jan. 11, '65;" and on the clasp link, "Constitution amended by Congress Jan. 31, '65. Constitutional Amendment ratified." Two of the links are vacant. What will the progress of civilization in America offer for the links nine and ten?

One of the most remarkable documents which resulted from Uncle Tom was an address from the women of England to the women of America, acknowledging the complicity in slavery of England, but praying aid in removing from the world "our common crimes and common dishonor," which was presented to Mrs. Stowe in 1853. It was the result of a meeting at Stafford House, and the address, composed by Lord Shaftesbury, was put into the hands of canvassers in England and on the Continent, and as far as Jerusalem. The signatures of 562,848 women were obtained, with their occupations and residences, from the nobility on the steps of the throne down to maids in the kitchen. The address is handsomely engrossed on vellum. The names are contained in twenty-six massive volumes, each fourteen inches high by nine in breadth and three inches thick, inclosed in an oak case. It is believed that this is the most numerously signed address in existence. The value of the address, with so many names collected in haphazard fashion, was much questioned, but its use was apparent in the height of the civil war, when Mrs. Stowe replied to it in one of the most vigorous and noble appeals that ever came from her pen. This powerful reply made a profound impression in England.

This is in brief the story of the book. It is still read, and read the world over, with tears and with laughter; it is still played to excited audiences. Is it a great novel, or was it only an event of an era of agitation and passion? Has it the real dramatic quality--the poet's visualizing of human life--that makes works of fiction, of imagination, live? Till recently, I had not read the book since 1852. I feared

to renew acquaintance with it lest I should find only the shell of an exploded cartridge. I took it up at the beginning of a three-hours' railway journey. To my surprise the journey did not seem to last half an hour, and half the time I could not keep back the tears from my eyes. A London critic, full of sympathy with Mrs. Stowe and her work, recently said, "Yet she was not an artist, she was not a great woman." What is greatness? What is art? In 1862 probably no one who knew General Grant would have called him a great man. But he took Vicksburg. This woman did something with her pen,--on the whole, the most remarkable and effective book in her generation. How did she do it? Without art? George Sand said, "In matters of art there is but one rule, to paint and to move. And where shall we find conditions more complete, types more vivid, situations more touching, more original, than in Uncle Tom?" If there is not room in our art for such a book, I think we shall have to stretch our art a little. "Women, too, are here judged and painted with a master hand." This subtle critic, in her overpoweringly tender and enthusiastic review, had already inquired about the capacity of this writer. "Mrs. Stowe is all instinct; it is the very reason that she appears to some not to have talent. Has she not talent? What is talent? Nothing, doubtless, compared to genius; but has she genius? I cannot say that she has talent as one understands it in the world of letters, but she has genius as humanity feels the need of genius,--the genius of goodness, not that of the man of letters, but of the saint." It is admitted that Mrs. Stowe was not a woman of letters in the common acceptation of that term, and it is plain that in the French tribunal, where form is of the substance of the achievement, and which reluctantly overlooked the crudeness of Walter Scott, in France where the best English novel seems a violation of established canons, Uncle Tom would seem to belong where some modern critics place it, with works of the heart, and not of the head. The reviewer is, however, candid: "For a long time we have striven in France against the prolix explanations of Walter Scott. We have cried out against those of Balzac, but on consideration have perceived that the painter of manners and character has never done too much, that every stroke of the pencil was needed for the general effect. Let us learn then to appreciate all kinds of treatment, where the effect is good, and where they bear the seal of a master hand."

It must be admitted to the art critic that the book is defective according to the rules of the modern French romance; that Mrs. Stowe was possessed by her subject, and let her fervid interest in it be felt; that she had a definite purpose. That purpose was to quicken the sense of responsibility of the North by showing the real character of slavery, and to touch the South by showing that the inevitable wrong of it lay in the system rather than in those involved in it. Abundant material was in her hands, and the author burned to make it serviceable. What should she do? She might have done what she did afterwards in The Key, presented to the public a mass of statistics, of legal documents. The evidence would have been unanswerable, but the jury might not have been moved by it; they would have balanced it by considerations of political and commercial expediency. I presume that Mrs. Stowe made no calculation of this kind. She felt her course, and went on in it. What would an artist have done, animated by her purpose and with her material? He would have done what Cervantes did, what Tourgenieff did, what Mrs. Stowe did. He would have dramatized his facts in living personalities, in effective scenes, in vivid pictures of life. Mrs. Stowe exhibited the system of slavery by a succession of dramatized pictures, not always artistically welded together, but always effective as an exhibition of the system. Cervantes also showed a fading feudal romantic condition by a series of amusing and pathetic adventures, grouped rather loosely about a singularly fascinating figure.

Tourgenieff, a more consummate artist, in his hunting scenes exhibited the effect of serfdom upon society, in a series of scenes with no necessary central figure, without comment, and with absolute concealment of any motive. I believe the three writers followed their instincts, without an analytic argument as to the method, as the great painter follows his when he puts an idea upon canvas. He may invent a theory about it afterwards; if he does not, some one else will invent it for him. There are degrees of art. One painter will put in unnecessary accessories, another will exhibit his sympathy too openly, the technique or the composition of another can be criticised. But the question is, is the picture great and effective?

Mrs. Stowe had not Tourgenieff's artistic calmness. Her mind was fused into a white heat with her message. Yet, how did she begin her story? Like an artist, by a highly dramatized scene, in which the actors, by a few strokes of the pen, appear as distinct and unmistakable personalities, marked by individual peculiarities of manner, speech, motive, character, living persons in natural attitudes. The reader becomes interested in a shrewd study of human nature, of a section of life, with its various refinement, coarseness, fastidiousness and vulgarity, its humor and pathos. As he goes on he discovers that every character has been perfectly visualized, accurately limned from the first; that a type has been created which remains consistent, which is never deflected from its integrity by any exigencies of plot. This clear conception of character (not of earmarks and peculiarities adopted as labels), and faithful adhesion to it in all vicissitudes, is one of the rarest and highest attributes of genius. All the chief characters in the book follow this line of absolutely consistent development, from Uncle Tom and Legree down to the most aggravating and contemptible of all, Marie St. Clare. The selfish and hysterical woman has never been so faithfully depicted by any other author.

Distinguished as the novel is by its character-drawing and its pathos, I doubt if it would have captivated the world without its humor. This is of the old-fashioned kind, the large humor of Scott, and again of Cervantes, not verbal pleasantry, not the felicities of Lamb, but the humor of character in action, of situations elaborated with great freedom, and with what may be called a hilarious conception. This quality is never wanting in the book, either for the reader's entertainment by the way, or to heighten the pathos of the narrative by contrast. The introduction of Topsy into the New Orleans household saves us in the dangerous approach to melodrama in the religious passages between Tom and St. Clare. Considering the opportunities of the subject, the book has very little melodrama; one is apt to hear low music on the entrance of little Eva, but we are convinced of the wholesome sanity of the sweet child. And it is to be remarked that some of the most exciting episodes, such as that of Eliza crossing the Ohio River on the floating ice (of which Mr. Ruskin did not approve), are based upon authentic occurrences. The want of unity in construction of which the critics complain is partially explained by the necessity of exhibiting the effect of slavery in its entirety. The parallel plots, one running to Louisiana and the other to Canada, are tied together by this consideration, and not by any real necessity to each other.

There is no doubt that Mrs. Stowe was wholly possessed by her theme, rapt away like a prophet in a vision, and that, in her feeling at the time, it was written through her quite as much as by her. This idea grew upon her mind in the retrospective light of the tremendous stir the story made in the world, so that in her later years she came to regard herself as a providential instrument, and frankly to declare that she did not write the book; "God wrote it." In her own account, when she reached the death of Uncle Tom, "the whole vital force left her." The inspiration there left her, and the end of the story, the weaving together of all the loose ends of the plot, in the joining together almost by miracle the long separated, and the discovery of the relationships, is the conscious invention of the novelist.

It would be perhaps going beyond the province of the critic to remark upon what the author considered the central power of the story, and its power to move the world, the faith of Uncle Tom in the Bible. This appeal to the emotion of millions of readers cannot, however, be overlooked. Many regard the book as effective in regions remote from our perplexities by reason of this grace. When the work was translated into Siamese, the perusal of it by one of the ladies of the court induced her to liberate all her slaves, men, women, and children, one hundred and thirty in all. "Hidden Perfume," for that was the English equivalent of her name, said she was wishful to be good like Harriet Beecher Stowe. And as to the standpoint of Uncle Tom and the Bible, nothing more significant can be cited than this passage from one of the latest writings of Heinrich Heine:--

"The reawakening of my religious feelings I owe to that holy book the Bible. Astonishing that after I have whirled about all my life over all the dance-floors of philosophy, and yielded myself to all the orgies of the intellect, and paid my addresses to all possible systems, without satisfaction like Messalina after a licentious night, I now find myself on the same standpoint where poor Uncle Tom stands,--on that of the Bible! I kneel down by my black brother in the same prayer! What a humiliation! With all my science I have come no further than the poor ignorant negro who has scarce learned to spell. Poor Tom, indeed, seems to have seen deeper things in the holy book than I.... Tom, perhaps, understands them better than I, because more flogging occurs in them; that is to say, those ceaseless blows of the whip which have aesthetically disgusted me in reading the Gospels and the Acts. But a poor negro slave reads with his back, and understands better than we do. But I, who used to make citations from Homer, now begin to quote the Bible as Uncle Tom does."

The one indispensable requisite of a great work of imaginative fiction is its universality, its conception and construction so that it will appeal to universal human nature in all races and situations and climates. Uncle Tom's Cabin does that. Considering certain artistic deficiencies, which the French writers perceived, we might say that it was the timeliness of its theme that gave it currency in England and America. But that argument falls before the world-wide interest in it as a mere story, in so many languages, by races unaffected by our own relation to slavery.

It was the opinion of James Russell Lowell that the anti-slavery element in Uncle Tom and Dred stood in the way of a full appreciation, at least in her own country, of the remarkable genius of Mrs. Stowe. Writing in 1859, he said, "From my habits and the tendency of my studies I cannot help looking at things purely from an aesthetic point of view, and what I valued in Uncle Tom was the genius, and not the moral." This had been his impression when he read the book in Paris, long after the whirl of excitement produced by its publication had subsided, and far removed by distance from local influences. Subsequently, in a review, he wrote, "We felt then, and we believe now, that the secret of Mrs. Stowe's power lay in that same genius by which the great successes in creative literature have always been achieved,--the genius that instinctively goes to the organic elements of human nature, whether under a white skin or a black, and which disregards as trivial the conventions and fictitious notions which make so large a part both of our thinking and feeling.... The creative faculty of Mrs. Stowe, like that of Cervantes in Don Quixote and of Fielding in Joseph Andrews, overpowered the narrow specialty of her design, and expanded a local and temporary theme with the cosmopolitanism of

genius."

A half-century is not much in the life of a people; it is in time an inadequate test of the staying power of a book. Nothing is more futile than prophecy on contemporary literary work. It is safe, however, to say that Uncle Tom's Cabin has the fundamental qualities, the sure insight into human nature, and the fidelity to the facts of its own time which have from age to age preserved works of genius.

STRIVINGS OF THE NEGRO PEOPLE by W. E. Burghardt Du Bois

Berween me and the other world there is ever an unasked question: unasked by some through feelings of delicacy; by others through the difficulty of rightly framing it. All, nevertheless, flutter round it. They approach me in a half-hesitant sort of way, eye me curiously or compassionately, and then, instead of saying directly, How does it feel to be a problem? they say, I know an excellent colored man in my town; or, I fought at Mechanicsville; or, Do not these Southern outrages make your blood boil? At these I smile, or am interested, or reduce the boiling to a simmer, as the occasion may require. To the real question, How does it feel to be a problem? I answer seldom a word.

And yet, being a problem is a strange experience,--peculiar even for one who has never been anything else, save perhaps in babyhood and in Europe. It is in the early days of rollicking boyhood that the revelation first bursts upon one, all in a day, as it were. I remember well when the shadow swept across me. I was a little thing, away up in the hills of New England, where the dark Housatonic winds between Hoosac and Taghanic to the sea. In a wee wooden schoolhouse, something put it into the boys' and girls' heads to buy gorgeous visiting-cards--ten cents a package--and exchange. The exchange was merry, till one girl, a tall newcomer, refused my card,--refused it peremptorily, with a glance. Then it dawned upon me with a certain suddenness that I was different from the others; or like, mayhap, in heart and life and longing, but shut out from their world by a vast veil. I had thereafter no desire to tear down that veil, to creep through; I held all beyond it in common contempt, and lived above it in a region of blue sky and great wandering shadows. That sky was bluest when I could beat my mates at examination-time, or beat them at a foot-race, or even beat their stringy heads. Alas, with the years all this fine contempt began to fade; for the world I longed for, and all its dazzling opportunities, were theirs, not mine. But they should not keep these prizes, I said; some, all, I would wrest from them. Just how I would do it I could never decide: by reading law, by healing the sick, by telling the wonderful tales that swam in my head,--some way. With other black boys the strife was not so fiercely sunny: their youth shrunk into tasteless sycophancy, or into silent hatred of the pale world about them and mocking distrust of everything white; or wasted itself in a bitter cry. Why did God make me an outcast and a stranger in mine own house? The "shades of the prison-house" closed round about us all: walls strait and stubborn to the whitest, but relentlessly narrow, tall, and unscalable to sons of night who must plod darkly on in resignation, or beat unavailing palms against the stone, or steadily, half hopelessly watch the streak of blue above.

After the Egyptian and Indian, the Greek and Roman, the Teuton and Mongolian, the Negro is a sort of seventh son, born with a veil, and gifted with second-sight in this American world,--a world which yields him no self-consciousness, but only lets him see himself through the revelation of the other world. It is a peculiar sensation, this double-consciousness, this sense of always looking at one's self through the eyes of others, of measuring one's soul by the tape of a world that looks on in amused contempt and pity. One ever feels his two-ness,--an American, a Negro; two souls, two thoughts, two unreconciled strivings; two warring ideals in one dark body, whose dogged strength alone keeps it from being torn asunder. The history of the American Negro is the history of this strife,--this longing to attain self-conscious manhood, to merge his double self into a better and truer self. In this merging he wishes neither of the older selves to be lost. He does not wish to Africanize America, for America has too much to teach the world and Africa; he does not wish to bleach his Negro blood in a flood of white Americanism, for he believes--foolishly, perhaps, but fervently--that Negro blood has yet a message for the world. He simply wishes to make it possible for a man to be both a Negro and an American without being cursed and spit upon by his fellows, without losing the opportunity of self-development.

This is the end of his striving: to be a co-worker in the kingdom of culture, to escape both death and isolation, and to husband and use his best powers. These powers, of body and of mind, have in the past been so wasted and dispersed as to lose all effectiveness, and to seem like absence of all power, like weakness. The double-aimed struggle of the black artisan, on the one hand to escape white contempt for a nation of mere hewers of wood and drawers of water, and on the other hand to plough and nail and dig for a poverty-stricken horde, could only result in making him a poor craftsman, for he had but half a heart in either cause. By the poverty and ignorance of his people the Negro lawyer or doctor was pushed toward quackery and demagogism, and by the criticism of the other world toward an elaborate preparation that overfitted him for his lowly tasks. The would-be black savant was

confronted by the paradox that the knowledge his people needed was a twice-told tale to his white neighbors, while the knowledge which would teach the white world was Greek to his own flesh and blood. The innate love of harmony and beauty that set the ruder souls of his people a-dancing, a-singing, and a-laughing raised but confusion and doubt in the soul of the black artist; for the beauty revealed to him was the soul-beauty of a race which his larger audience despised, and he could not articulate the message of another people.

This waste of double aims, this seeking to satisfy two unreconciled ideals, has wrought sad havoc with the courage and faith and deeds of eight thousand thousand people, has sent them often wooing false gods and invoking false means of salvation, and has even at times seemed destined to make them ashamed of themselves. In the days of bondage they thought to see in one divine event the end of all doubt and disappointment; eighteenth-century Rousseauism never worshiped freedom with half the unquestioning faith that the American Negro did for two centuries. To him slavery was, indeed, the sum of all villainies, the cause of all sorrow, the root of all prejudice; emancipation was the key to a promised land of sweeter beauty than ever stretched before the eyes of wearied Israelites. In his songs and exhortations swelled one refrain, liberty; in his tears and curses the god he implored had freedom in his right hand. At last it came,--suddenly, fearfully, like a dream. With one wild carnival of blood and passion came the message in his own plaintive cadences:--

"Shout, O children! Shout, you're free! The Lord has bought your liberty!"

Years have passed away, ten, twenty, thirty. Thirty years of national life, thirty years of renewal and development, and yet the swarthy ghost of Banquo sits in its old place at the national feast. In vain does the nation cry to its vastest problem,--

"Take any shape but that, and my firm nerves Shall never tremble!"

The freedman has not yet found in freedom his promised land. Whatever of lesser good may have come in these years of change, the shadow of a deep disappointment rests upon the Negro people,--a disappointment all the more bitter because the unattained ideal was unbounded save by the simple ignorance of a lowly folk.

The first decade was merely a prolongation of the vain search for freedom, the boom that seemed ever barely to elude their grasp,--like a tantalizing will-o'-the-wisp, maddening and misleading the headless host. The holocaust of war, the terrors of the Kuklux Klan, the lies of carpet-baggers, the disorganization of industry, and the contradictory advice of friends and foes left the bewildered serf with no new watchword beyond the old cry for freedom. As the decade closed, however, he began to grasp a new idea. The ideal of liberty demanded for its attainment powerful means, and these the Fifteenth Amendment gave him. The ballot, which before he had looked upon as a visible sign of freedom, he now regarded as the chief means of gaining and perfecting the liberty with which war had partially endowed him. And why not? Had not votes made war and emancipated millions? Had not votes enfranchised the freedmen? Was anything impossible to a power that had done all this? A million black men started with renewed zeal to vote themselves into the kingdom. The decade fled away,--a decade containing, to the freedman's mind, nothing but suppressed votes, stuffed ballot-boxes, and election outrages that nullified his vaunted right of suffrage. And yet that decade from 1875 to 1885 held another powerful movement, the rise of another ideal to guide the unguided, another pillar of fire by night after a clouded day. It was the ideal of "book-learning;" the curiosity, born of compulsory ignorance, to know and test the power of the cabalistic letters of the white man, the longing to know. Mission and night schools began in the smoke of battle, ran the gauntlet of reconstruction, and at last developed into permanent foundations. Here at last seemed to have been discovered the mountain path to Canaan; longer than the highway of emancipation and law, steep and rugged, but straight, leading to heights high enough to overlook life.

Up the new path the advance guard toiled, slowly, heavily, doggedly; only those who have watched and guided the faltering feet, the misty minds, the dull understandings of the dark pupils of these schools know how faithfully, how piteously, this people strove to learn. It was weary work. The cold statistician wrote down the inches of progress here and there, noted also where here and there a foot had slipped or some one had fallen. To the tired climbers, the horizon was ever dark, the mists were often cold, the Canaan was always dim and far away. If, however, the vistas disclosed as yet no goal, no resting-place, little but flattery and criticism, the journey at least gave leisure for reflection and self-examination; it changed the child of emancipation to the youth with dawning self-consciousness, self-realization, self-respect. In those sombre forests of his striving his own soul rose before him, and he saw himself,--darkly as through a veil; and yet he saw in himself some faint revelation of his power, of his mission. He began to have a dim feeling that, to attain his place in the world, he must be himself, and not another. For the first time he sought to analyze the burden he bore upon his back, that dead-weight of social degradation partially masked behind a half-named Negro problem. He felt

his poverty; without a cent, without a home, without land, tools, or savings, he had entered into competition with rich, landed, skilled neighbors. To be a poor man is hard, but to be a poor race in a land of dollars is the very bottom of hardships. He felt the weight of his ignorance,--not simply of letters, but of life, of business, of the humanities; the accumulated sloth and shirking and awkwardness of decades and centuries shackled his hands and feet. Nor was his burden all poverty and ignorance. The red stain of bastardy, which two centuries of systematic legal defilement of Negro women had stamped upon his race, meant not only the loss of ancient African chastity, but also the hereditary weight of a mass of filth from white whoremongers and adulterers, threatening almost the obliteration of the Negro home.

A people thus handicapped ought not to be asked to race with the world, but rather allowed to give all its time and thought to its own social problems. But alas! while sociologists gleefully count his bastards and his prostitutes, the very soul of the toiling, sweating black man is darkened by the shadow of a vast despair. Men call the shadow prejudice, and learnedly explain it as the natural defense of culture against barbarism, learning against ignorance, purity against crime, the "higher" against the "lower" races. To which the Negro cries Amen! and swears that to so much of this strange prejudice as is founded on just homage to civilization, culture, righteousness, and progress he humbly bows and meekly does obeisance. But before that nameless prejudice that leaps beyond all this he stands helpless, dismayed, and well-nigh speechless; before that personal disrespect and mockery, the ridicule and systematic humiliation, the distortion of fact and wanton license of fancy, the cynical ignoring of the better and boisterous welcoming of the worse, the all-pervading desire to inculcate disdain for everything black, from Toussaint to the devil,--before this there rises a sickening despair that would disarm and discourage any nation save that black host to whom "discouragement" is an unwritten word.

They still press on, they still nurse the dogged hope,--not a hope of nauseating patronage, not a hope of reception into charmed social circles of stock-jobbers, pork-packers, and earl-hunters, but the hope of a higher synthesis of civilization and humanity, a true progress, with which the chorus

"Peace, good will to men," "May make one music as before, But vaster."

Thus the second decade of the American Negro's freedom was a period of conflict, of inspiration and doubt, of faith and vain questionings, of Sturm and Drang. The ideals of physical freedom, of political power, of school training, as separate all-sufficient panaceas for social ills, became in the third decade dim and overcast. They were the vain dreams of credulous race childhood; not wrong, but incomplete and over-simple. The training of the schools we need to-day more than ever,--the training of deft hands, quick eyes and ears, and the broader, deeper, higher culture of gifted minds. The power of the ballot we need in sheer self-defense, and as a guarantee of good faith. We may misuse it, but we can scarce do worse in this respect than our whilom masters. Freedom, too, the long-sought, we still seek,--the freedom of life and limb, the freedom to work and think. Work, culture, and liberty,--all these we need, not singly, but together; for to-day these ideals among the Negro people are gradually coalescing, and finding a higher meaning in the unifying ideal of race,--the ideal of fostering the traits and talents of the Negro, not in opposition to, but in conformity with, the greater ideals of the American republic, in order that some day, on American soil, two world races may give each to each those characteristics which both so sadly lack. Already we come not altogether empty-handed: there is to-day no true American music but the sweet wild melodies of the Negro slave; the American fairy tales are Indian and African; we are the sole oasis of simple faith and reverence in a dusty desert of dollars and smartness. Will America be poorer if she replace her brutal, dyspeptic blundering with the light-hearted but determined Negro humility; or her coarse, cruel wit with loving, jovial good humor; or her Annie Rooney with Steal Away?

Merely a stern concrete test of the underlying principles of the great republic is the Negro problem, and the spiritual striving of the freedmen's sons is the travail of souls whose burden is almost beyond the measure of their strength, but who bear it in the name of an historic race, in the name of this land of their fathers' fathers, and in the name of human opportunity.

THE WIFE OF HIS YOUTH by Charles W. Chesnutt

I.

Mr. Ryder was going to give a ball. There were several reasons why this was an opportune time for such an event.

Mr. Ryder might aptly be called the dean of the Blue Veins. The original Blue Veins were a little society of colored persons organized in a certain Northern city shortly after the war. Its purpose was to establish and maintain correct social standards among

a people whose social condition presented almost unlimited room for improvement. By accident, combined perhaps with some natural affinity, the society consisted of individuals who were, generally speaking, more white than black. Some envious outsider made the suggestion that no one was eligible for membership who was not white enough to show blue veins. The suggestion was readily adopted by those who were not of the favored few, and since that time the society, though possessing a longer and more pretentious name, had been known far and wide as the "Blue Vein Society," and its members as the "Blue Veins."

The Blue Veins did not allow that any such requirement existed for admission to their circle, but, on the contrary, declared that character and culture were the only things considered; and that if most of their members were light-colored, it was because such persons, as a rule, had had better opportunities to qualify themselves for membership. Opinions differed, too, as to the usefulness of the society. There were those who had been known to assail it violently as a glaring example of the very prejudice from which the colored race had suffered most; and later, when such critics had succeeded in getting on the inside, they had been heard to maintain with zeal and earnestness that the society was a life-boat, an anchor, a bulwark and a shield, a pillar of cloud by day and of fire by night, to guide their people through the social wilderness. Another alleged prerequisite for Blue Vein membership was that of free birth; and while there was really no such requirement, it is doubtless true that very few of the members would have been unable to meet it if there had been. If there were one or two of the older members who had come up from the South and from slavery, their history presented enough romantic circumstances to rob their servile origin of its grosser aspects. While there were no such tests of eligibility, it is true that the Blue Veins had their notions on these subjects, and that not all of them were equally liberal in regard to the things they collectively disclaimed. Mr. Ryder was one of the most conservative. Though he had not been among the founders of the society, but had come in some years later, his genius for social leadership was such that he had speedily become its recognized adviser and head, the custodian of its standards, and the preserver of its traditions. He shaped its social policy, was active in providing for its entertainment, and when the interest fell off, as it sometimes did, he fanned the embers until they burst again into a cheerful flame. There were still other reasons for his popularity. While he was not as white as some of the Blue Veins, his appearance was such as to confer distinction upon them. His features were of a refined type, his hair was almost straight; he was always neatly dressed; his manners were irreproachable, and his morals above suspicion. He had come to Groveland a young man, and obtaining employment in the office of a railroad company as messenger had in time worked himself up to the position of stationery clerk, having charge of the distribution of the office supplies for the whole company. Although the lack of early training had hindered the orderly development of a naturally fine mind, it had not prevented him from doing a great deal of reading or from forming decidedly literary tastes. Poetry was his passion. He could repeat whole pages of the great English poets; and if his pronunciation was sometimes faulty, his eye, his voice, his gestures, would respond to the changing sentiment with a precision that revealed a poetic soul, and disarm criticism. He was economical, and had saved money; he owned and occupied a very comfortable house on a respectable street. His residence was handsomely furnished, containing among other things a good library, especially rich in poetry, a piano, and some choice engravings. He generally shared his house with some young couple, who looked after his wants and were company for him; for Mr. Ryder was a single man. In the early days of his connection with the Blue Veins he had been regarded as quite a catch, and ladies and their mothers had manoeuvred with much ingenuity to capture him. Not, however, until Mrs. Molly Dixon visited Groveland had any woman ever made him wish to change his condition to that of a married man.

Mrs. Dixon had come to Groveland from Washington in the spring, and before the summer was over she had won Mr. Ryder's heart. She possessed many attractive qualities. She was much younger than he; in fact, he was old enough to have been her father, though no one knew exactly how old he was. She was whiter than he, and better educated. She had moved in the best colored society of the country, at Washington, and had taught in the schools of that city. Such a superior person had been eagerly welcomed to the Blue Vein Society, and had taken a leading part in its activities. Mr. Ryder had at first been attracted by her charms of person, for she was very good looking and not over twenty-five; then by her refined manners and by the vivacity of her wit. Her husband had been a government clerk, and at his death had left a considerable life insurance. She was visiting friends in Groveland, and, finding the town and the people to her liking, had prolonged her stay indefinitely. She had not seemed displeased at Mr. Ryder's attentions, but on the contrary had given him every proper encouragement; indeed, a younger and less cautious man would long since have spoken. But he had made up his mind, and had only to determine the time when he would ask her to be his wife. He decided to give a ball in her honor, and at some time during the evening of the ball to offer her his heart and hand. He had no special fears about the outcotme, but, with a little touch of romance, he wanted the surroundings to be in harmony with his own feelings when he should have received the answer he expected.

Mr. Ryder resolved that this ball should mark an epoch in the social history of Groveland. He knew, of course,--no one could know better,--the entertainments that had taken place in past years, and what must be done to surpass them. His ball must be worthy of

the lady in whose honor it was to be given, and must, by the quality of its guests, set an example for the future. He had observed of late a growing liberality, almost a laxity, in social matters, even among members of his own set, and had several times been forced to meet in a social way persons whose complexions and callings in life were hardly up to the standard which he considered proper for the society to maintain. He had a theory of his own.

"I have no race prejudice," he would say, "but we people of mixed blood are ground between the upper and the nether millstone. Our fate lies between absorption by the white race and extinction in the black. The one doesn't want us yet, but may take us in time. The other would welcome us, but it would be for us a backward step. 'With malice towards none, with charity for all,' we must do the best we can for ourselves and those who are to follow us. Self-preservation is the first law of nature."

His ball would serve by its exclusiveness to counteract leveling tendencies, and his marriage with Mrs. Dixon would help to further the upward process of absorption he had been wishing and waiting for.

II.

The ball was to take place on Friday night. The house had been put in order, the carpets covered with canvas, the halls and stairs decorated with palms and potted plants; and in the afternoon Mr. Ryder sat on his front porch, which the shade of a vine running up over a wire netting made a cool and pleasant lounging-place. He expected to respond to the toast "The Ladies," at the supper, and from a volume of Tennyson--his favorite poet--was fortifying himself with apt quotations. The volume was open at A Dream of Fair Women. His eyes fell on these lines, and he read them aloud to judge better of their effect:--

"At length I saw a lady within call. Stiller than chisell'd marble, standing there; A daughter of the gods, divinely tall, And most divinely fair."

He marked the verse, and turning the page read the stanza beginning,--

"O sweet pale Margaret, O rare pale Margaret."

He weighed the passage a moment, and decided that it would not do. Mrs. Dixon was the palest lady he expected at the ball, and she was of a rather ruddy complexion, and of lively disposition and buxom build. So he ran over the leaves until his eye rested on the description of Queen Guinevere:--

"She seem'd a part of joyous Spring: A gown of grass-green silk she wore, Buckled with golden clasps before; A light-green tuft of plumes she bore Closed in a golden ring.

. . . . . .

"She look'd so lovely, as she sway'd The rein with dainty finger-tips, A man had given all other bliss, And all his worldly worth for this, To waste his whole heart in one kiss Upon her perfect lips."

As Mr. Ryder murmured these words audibly, with an appreciative thrill, he heard the latch of his gate click, and a light footfall sounding on the steps. He turned his head, and saw a woman standing before the door.

She was a little woman, not five feet tall, and proportioned to her height. Although she stood erect, and looked around her with very bright and restless eyes, she seemed quite old; for her face was crossed and recrossed with a hundred wrinkles, and around the edges of her bonnet could be seen protruding here and there a tuft of short gray wool. She wore a blue calico gown of ancient cut, a little red shawl fastened around her shoulders with an old-fashioned brass brooch, and a large bonnet profusely ornamented with faded red and yellow artificial flowers. And she was very black--so black that her toothless gums, revealed when she opened her mouth to speak, were not red, but blue. She looked like a bit of the old plantation life, summoned up from the past by the wave of a magician's wand, as the poet's fancy had called into being the gracious shapes of which Mr. Ryder had just been reading.

He rose from his chair and came over to where she stood.

"Good-afternoon, madam," he said.

"Good-evenin', suh," she answered, ducking suddenly with a quaint curtsy. Her voice was shrill and piping, but softened somewhat by age. "Is dis yere whar Mistuh Ryduh lib, suh?" she asked, looking around her doubtfully, and glancing into the open windows,

through which some of the preparations for the evening were visible.

"Yes," he replied, with an air of kindly patronage, unconsciously flattered by her manner, "I am Mr. Ryder. Did you want to see me?"

"Yas, suh, ef I ain't 'sturbin' of you too much."

"Not at all. Have a seat over here behind the vine, where it is cool. What can I do for you?"

"'Scuse me, suh," she continued, when she had sat down on the edge of a chair, "'scuse me, suh, I's lookin' for my husban'. I heerd you wuz a big man an' had libbed heah a long time, an' I 'lowed you wouldn't min' ef I'd come roun' an' ax you ef you'd eber heerd of a merlatter man by de name er Sam Taylor 'quirin' roun' in de chu'ches ermongs' de people fer his wife 'Liza Jane?"

Mr. Ryder seemed to think for a moment.

"There used to be many such cases right after the war," he said, "but it has been so long that I have forgotten them. There are very few now. But tell me your story, and it may refresh my memory."

She sat back farther in her chair so as to be more comfortable, and folded her withered hands in her lap.

"My name's 'Liza," she began, "'Liza Jane. Wen I wuz young I us'ter b'long ter Marse Bob Smif, down in old Missourn. I wuz bawn down dere. W'en I wuz a gal I wuz married ter a man named Jim. But Jim died, an' after dat I married a merlatter man named Sam Taylor. Sam wuz free-bawn, but his mammy and daddy died, an' de w'ite folks 'prenticed him ter my marster fer ter work fer 'im 'tel he wuz growed up. Sam worked in de fiel', an' I wuz de cook. One day Ma'y Ann, ole miss's maid, come rushin' out ter de kitchen, an' says she, "Liza Jane, ole marse gwine sell yo' Sam down de ribber.'

"'Go way f'm yere,' says I; 'my husban's free!'

"'Don' make no diff'ence. I heerd ole marse tell ole miss he wuz gwine take yo' Sam 'way wid 'im ter-morrow, fer he needed money, an' he knowed whar he could git a t'ousan' dollars fer Sam an' no questions axed.'

"W'en Sam come home f'm de fiel', dat night, I tole him 'bout ole marse gwine steal 'im, an' Sam run erway. His time wuz mos' up, an' he swo' dat w'en he wuz twenty-one he would come back an' he'p me run erway, er else save up de money ter buy my freedom. An' I know he'd 'a' done it, fer he thought a heap er me, Sam did. But w'en he come back he didn' fin' me, fer I wuzn' dere. Ole marse had heerd dat I warned Sam, so he had me whip' an' sol' down de ribber.

"Den de wah broke out, an' w'en it wuz ober de cullud folks wuz scattered. I went back ter de ole home; but Sam wuzn' dere, an' I couldn' l'arn nuffin' 'bout 'im. But I knowed he'd be'n dere to look fer me an' hadn' foun' me, an' had gone erway ter hunt fer me.

"I's be'n lookin' fer 'im eber sence," she added simply, as though twenty-five years were but a couple of weeks, "an' I knows he's be'n lookin' fer me. Fer he sot a heap er sto' by me, Sam did, an' I know he's be'n huntin' fer me all dese years,--'less'n he's be'n sick er sump'n, so he couldn' work, er out'n his head, so he couldn' 'member his promise. I went back down de ribber, fer I 'lowed he'd gone down dere lookin' fer me. I's be'n ter Noo Orleens, an' Atlanty, an' Charleston, an' Richmon'; an' w'en I'd be'n all ober de Souf I come ter de Norf. Fer I knows I'll fin' 'im some er dese days," she added softly, "er he'll fin' me, an' den we'll bofe be as happy in freedom as we wuz in de ole days befo' de wah." A smile stole over her withered countenance as she paused a moment, and her bright eyes softened into a far-away look.

This was the substance of the old woman's story. She had wandered a little here and there. Mr. Ryder was looking at her curiously when she finished.

"How have you lived all these years?" he asked.

"Cookin', suh. I's a good cook. Does you know anybody w'at needs a good cook, suh? I's stoppin' wid a cullud fam'ly roun' de corner yonder 'tel I kin fin' a place."

"Do you really expect to find your husband? He may be dead long ago."

She shook her head emphatically. "Oh no, he ain' dead. De signs an' de tokens tells me. I dremp three nights runnin' on'y dis las' week dat I foun' him."

"He may have married another woman. Your slave marriage would not have prevented him, for you never lived with him after the war, and without that your marriage doesn't count."

"Wouldn' make no diff'ence wid Sam. He wouldn' marry no yuther 'ooman 'tel he foun' out 'bout me. I knows it," she added. "Sump'n's be'n tellin' me all dese years dat I's gwine fin' Sam 'fo I dies."

"Perhaps he's outgrown you, and climbed up in the world where he wouldn't care to have you find him."

"No, indeed, suh," she replied, "Sam ain' dat kin' er man. He wuz good ter me, Sam wuz, but he wuzn' much good ter nobody e'se, fer he wuz one er de triflin'es' han's on de plantation. I 'spec's ter haf ter suppo't 'im w'en I fin' 'im, fer he nebber would work 'less'n he had ter. But den he wuz free, an' he didn' git no pay fer his work, an' I don' blame 'im much. Mebbe he's done better sence he run erway, but I ain' 'spectin' much."

"You may have passed him on the street a hundred times during the twenty-five years, and not have known him; time works great changes."

She smiled incredulously. "I'd know 'im 'mongs' a hund'ed men. Fer dey wuzn' no yuther merlatter man like my man Sam, an' I couldn' be mistook. I's toted his picture roun' wid me twenty-five years."

"May I see it?" asked Mr. Ryder. "It might help me to remember whether I have seen the original."

As she drew a small parcel from her bosom, he saw that it was fastened to a string that went around her neck. Removing several wrappers, she brought to light an old-fashioned daguerreotype in a black case. He looked long and intently at the portrait. It was faded with time, but the features were still distinct, and it was easy to see what manner of man it had represented.

He closed the case, and with a slow movement handed it back to her.

"I don't know of any man in town who goes by that name," he said, "nor have I heard of any one making such inquiries. But if you will leave me your address, I will give the matter some attention, and if I find out anything I will let you know."

She gave him the number of a house in the neighborhood, and went away, after thanking him warmly.

He wrote down the address on the flyleaf of the volume of Tennyson, and, when she had gone, rose to his feet and stood looking after her curiously. As she walked down the street with mincing step, he saw several persons whom she passed turn and look back at her with a smile of kindly amusement. When she had turned the corner, he went upstairs to his bedroom, and stood for a long time before the mirror of his dressing-case, gazing thoughtfully at the reflection of his own face.

III.

At eight o'clock the ballroom was a blaze of light and the guests had begun to assemble; for there was a literary programme and some routine business of the society to be gone through with before the dancing. A black servant in evening dress waited at the door and directed the guests to the dressing-rooms.

The occasion was long memorable among the colored people of the city; not alone for the dress and display, but for the high average of intelligence and culture that distinguished the gathering as a whole. There were a number of school-teachers, several young doctors, three or four lawyers, some professional singers, an editor, a lieutenant in the United States army spending his furlough in the city, and others in various polite callings; these were colored, though most of them would not have attracted even a casual glance because of any marked difference from white people. Most of the ladies were in evening costume, and dress coats and dancing-pumps were the rule among the men. A band of string music, stationed in an alcove behind a row of palms, played popular airs while the guests were gathering.

The dancing began at half past nine. At eleven o'clock supper was served. Mr. Ryder had left the ballroom some little time before the intermission, but reappeared at the supper-table. The spread was worthy of the occasion, and the guests did full justice to it. When the coffee had been served, the toastmaster, Mr. Solomon Sadler, rapped for order. He made a brief introductory speech, complimenting host and guests, and then presented in their order the toasts of the evening. They were responded to with a very fair display of after-dinner wit.

"The last toast," said the toast-master, when he reached the end of the list, "is one which must appeal to us all. There is no one of us of the sterner sex who is not at some time dependent upon woman,--in infancy for protection, in manhood for companionship, in old age for care and comforting. Our good host has been trying to live alone, but the fair faces I see around me to-night prove that he too is largely dependent upon the gentler sex for most that makes life worth living,--the society and love of friends,--and rumor is at fault if he does not soon yield entire subjection to one of them. Mr. Ryder will now respond to the toast,--The Ladies."

There was a pensive look in Mr. Ryder's eyes as he took the floor and adjusted his eyeglasses. He began by speaking of woman as the gift of Heaven to man, and after some general observations on the relations of the sexes he said: "But perhaps the quality which most distinguishes woman is her fidelity and devotion to those she loves. History is full of examples, but has recorded none more striking than one which only to-day came under my notice."

He then related, simply but effectively, the story told by his visitor of the afternoon. He told it in the same soft dialect, which came readily to his lips, while the company listened attentively and sympathetically. For the story had awakened a responsive thrill in many hearts. There were some present who had seen, and others who had heard their fathers and grandfathers tell, the wrongs and sufferings of this past generation, and all of them still felt, in their darker moments, the shadow hanging over them. Mr. Ryder went on:--

"Such devotion and such confidence are rare even among women. There are many who would have searched a year, some who would have waited five years, a few who might have hoped ten years; but for twenty-five years this woman has retained her affection for and her faith in a man she has not seen or heard of in all that time.

"She came to me to-day in the hope that I might be able to help her find this long-lost husband. And when she was gone I gave my fancy rein, and imagined a case I will put to you.

"Suppose that this husband, soon after his escape, had learned that his wife had been sold away, and that such inquiries as he could make brought no information of her whereabouts. Suppose that he was young, and she much older than he; that he was light, and she was black; that their marriage was a slave marriage, and legally binding only if they chose to make it so after the war. Suppose, too, that he made his way to the North, as some of us have done, and there, where he had larger opportunities, had improved them, and had in the course of all these years grown to be as different from the ignorant boy who ran away from fear of slavery as the day is from the night. Suppose, even, that he had qualified himself, by industry, by thrift, and by study, to win the friendship and be considered worthy the society of such people as these I see around me to-night, gracing my board and filling my heart with gladness; for I am old enough to remember the day when such a gathering would not have been possible in this land. Suppose, too, that, as the years went by, this man's memory of the past grew more and more indistinct, until at last it was rarely, except in his dreams, that any image of this bygone period rose before his mind. And then suppose that accident should bring to his knowledge the fact that the wife of his youth, the wife he had left behind him,--not one who had walked by his side and kept pace with him in his upward struggle, but one upon whom advancing years and a laborious life had set their mark,--was alive and seeking him, but that he was absolutely safe from recognition or discovery, unless he chose to reveal himself. My friends, what would the man do? I will suppose that he was one who loved honor, and tried to deal justly with all men. I will even carry the case further, and suppose that perhaps he had set his heart upon another, whom he had hoped to call his own. What would he do, or rather what ought he to do, in such a crisis of a lifetime?

"It seemed to me that he might hesitate, and I imagined that I was an old friend, a near friend, and that he had come to me for advice; and I argued the case with him. I tried to discuss it impartially. After we had looked upon the matter from every point of view, I said to him, in words that we all know:

'This above all: to thine own self be true, And it must follow, as the night the day, Thou canst not then be false to any man.'

Then, finally, I put the question to him, 'Shall you acknowledge her?'

"And now, ladies and gentlemen, friends and companions, I ask you, what should he have done?"

There was something in Mr. Ryder's voice that stirred the hearts of those who sat around him. It suggested more than mere sympathy with an imaginary situation; it seemed rather in the nature of a personal appeal. It was observed, too, that his look rested more especially upon Mrs. Dixon, with a mingled expression of renunciation and inquiry.

She had listened, with parted lips and streaming eyes. She was the first to speak: "He should have acknowledged her."

"Yes," they all echoed, "he should have acknowledged her."

"My friends and companions," responded Mr. Ryder, "I thank you, one and all. It is the answer I expected, for I knew your hearts."

He turned and walked toward the closed door of an adjoining room, while every eye followed him in wondering curiosity. He came back in a moment, leading by the hand his visitor of the afternoon, who stood startled and trembling at the sudden plunge into this scene of brilliant gayety. She was neatly dressed in gray, and wore the white cap of an elderly woman.

"Ladies and gentlemen," he said, "this is the woman, and I am the man, whose story I have told you. Permit me to introduce to you the wife of my youth."

THE BOUQUET by Charles W. Chesnutt

Mary Myrover's friends were somewhat surprised when she began to teach a colored school. Miss Myrover's friends are mentioned here, because nowhere more than in a Southern town is public opinion a force which cannot be lightly contravened. Public opinion, however, did not oppose Miss Myrover's teaching colored children; in fact, all the colored public schools in town--and there were several--were taught by white teachers, and had been so taught since the state had undertaken to provide free public instruction for all children within its boundaries. Previous to that time there had been a Freedman's Bureau school and a Presbyterian missionary school, but these had been withdrawn when the need for them became less pressing. The colored people of the town had been for some time agitating their right to teach their own schools, but as yet the claim had not been conceded.

The reason Miss Myrover's course created some surprise was not, therefore, the fact that a Southern white woman should teach a colored school; it lay in the fact that up to this time no woman of just her quality had taken up such work. Most of the teachers of colored schools were not of those who had constituted the aristocracy of the old regime; they might be said rather to represent the new order of things, in which labor was in time to become honorable, and men were, after a somewhat longer time, to depend, for their place in society, upon themselves rather than upon their ancestors. But Mary Myrover belonged to one of the proudest of the old families. Her ancestors had been people of distinction in Virginia before a collateral branch of the main stock had settled in North Carolina. Before the war they had been able to live up to their pedigree. But the war brought sad changes. Miss Myrover's father--the Colonel Myrover who led a gallant but desperate charge at Vicksburg--had fallen on the battlefield, and his tomb in the white cemetery was a shrine for the family. On the Confederate Memorial Day no other grave was so profusely decorated with flowers, and in the oration pronounced the name of Colonel Myrover was always used to illustrate the highest type of patriotic devotion and self-sacrifice. Miss Myrover's brother, too, had fallen in the conflict; but his bones lay in some unknown trench, with those of a thousand others who had fallen on the same field. Ay, more, her lover, who had hoped to come home in the full tide of victory and claim his bride as a reward for gallantry, had shared the fate of her father and brother. When the war was over, the remnant of the family found itself involved in the common ruin,--more deeply involved, indeed, than some others; for Colonel Myrover had believed in the ultimate triumph of his cause, and had invested most of his wealth in Confederate bonds, which were now only so much waste paper.

There had been a little left. Mrs. Myrover was thrifty, and had laid by a few hundred dollars, which she kept in the house to meet unforeseen contingencies. There remained, too, their home, with an ample garden and a well-stocked orchard, besides a considerable tract of country land, partly cleared, but productive of very little revenue.

With their shrunken resources, Miss Myrover and her mother were able to hold up their heads without embarrassment for some years after the close of the war. But when things were adjusted to the changed conditions, and the stream of life began to flow more vigorously in the new channels, they saw themselves in danger of dropping behind, unless in some way they could add to their meagre income. Miss Myrover looked over the field of employment, never very wide for women in the South, and found it occupied. The only available position she could be supposed prepared to fill, and which she could take without distinct loss of caste, was that of a teacher, and there was no vacancy except in one of the colored schools. Even teaching was a doubtful experiment; it was not what she would have preferred, but it was the best that could be done.

"I don't like it, Mary," said her mother. "It's a long step from owning such people to teaching them. What do they need with education? It will only make them unfit for work."

"They're free now, mother, and perhaps they'll work better if they're taught something. Besides, it's only a business arrangement, and doesn't involve any closer contact than we have with our servants."

"Well, I should say not!" sniffed the old lady. "Not one of them will ever dare to presume on your position to take any liberties with us. I'll see to that."

Miss Myrover began her work as a teacher in the autumn, at the opening of the school year. It was a novel experience at first. Though there always had been negro servants in the house, and though on the streets colored people were more numerous than her own people, and though she was so familiar with their dialect that she might almost be said to speak it, barring certain characteristic grammatical inaccuracies, she had never been brought in personal contact with so many of them at once as when she confronted the fifty or sixty faces--of colors ranging from a white almost as clear as her own to the darkest livery of the sun--which were gathered in the schoolroom on the morning when she began her duties. Some of the inherited prejudice of her caste, too, made itself felt, though she tried to repress any outward sign of it; and she could perceive that the children were not altogether responsive; they, likewise, were not entirely free from antagonism. The work was unfamiliar to her. She was not physically very strong, and at the close of the first day she went home with a splitting headache. If she could have resigned then and there without causing comment or annoyance to others, she would have felt it a privilege to do so. But a night's rest banished her headache and improved her spirits, and the next morning she went to her work with renewed vigor, fortified by the experience of the first day.

Miss Myrover's second day was more satisfactory. She had some natural talent for organization, though she had never known it, and in the course of the day she got her classes formed and lessons under way. In a week or two she began to classify her pupils in her own mind, as bright or stupid, mischievous or well behaved, lazy or industrious, as the case might be, and to regulate her discipline accordingly. That she had come of a long line of ancestors who had exercised authority and mastership was perhaps not without its effect upon her character, and enabled her more readily to maintain good order in the school. When she was fairly broken in she found the work rather to her liking, and derived much pleasure from such success as she achieved as a teacher.

It was natural that she should be more attracted to some of her pupils than to others. Perhaps her favorite--or rather, the one she liked best, for she was too fair and just for conscious favoritism--was Sophy Tucker. Just the ground for the teacher's liking for Sophy might not at first be apparent. The girl was far from the whitest of Miss Myrover's pupils; in fact, she was one of the darker ones. She was not the brightest in intellect, though she always tried to learn her lessons. She was not the best dressed, for her mother was a poor widow, who went out washing and scrubbing for a living. Perhaps the real tie between them was Sophy's intense devotion to the teacher. It had manifested itself almost from the first day of the school, in the rapt look of admiration Miss Myrover always saw on the little black face turned toward her. In it there was nothing of envy, nothing of regret; nothing but worship for the beautiful white lady--she was not especially handsome, but to Sophy her beauty was almost divine--who had come to teach her. If Miss Myrover dropped a book, Sophy was the first to spring and pick it up; if she wished a chair moved, Sophy seemed to anticipate her wish; and so of all the numberless little services that can be rendered in a school-room.

Miss Myrover was fond of flowers, and liked to have them about her. The children soon learned of this taste of hers, and kept the vases on her desk filled with blossoms during their season. Sophy was perhaps the most active in providing them. If she could not get garden flowers, she would make excursions to the woods in the early morning, and bring in great dew-laden bunches of bay, or jasmine, or some other fragrant forest flower which she knew the teacher loved.

"When I die, Sophy," Miss Myrover said to the child one day, "I want to be covered with roses. And when they bury me, I'm sure I shall rest better if my grave is banked with flowers, and roses are planted at my head and at my feet."

Miss Myrover was at first amused at Sophy's devotion; but when she grew more accustomed to it, she found it rather to her liking. It had a sort of flavor of the old regime, and she felt, when she bestowed her kindly notice upon her little black attendant, some of the feudal condescension of the mistress toward the slave. She was kind to Sophy, and permitted her to play the role she had assumed, which caused sometimes a little jealousy among the other girls. Once she gave Sophy a yellow ribbon which she took from her own hair. The child carried it home, and cherished it as a priceless treasure, to be worn only on the greatest occasions.

Sophy had a rival in her attachment to the teacher, but the rivalry was altogether friendly. Miss Myrover had a little dog, a white spaniel, answering to the name of Prince. Prince was a dog of high degree, and would have very little to do with the children of the school; he made an exception, however, in the case of Sophy, whose devotion for his mistress he seemed to comprehend. He was a clever dog, and could fetch and carry, sit up on his haunches, extend his paw to shake hands, and possessed several other canine accomplishments. He was very fond of his mistress, and always, unless shut up at home, accompanied her to school, where he spent most of his time lying under the teacher's desk, or, in cold weather, by the stove, except when he would go out now and

then and chase an imaginary rabbit round the yard, presumably for exercise.

At school Sophy and Prince vied with each other in their attentions to Miss Myrover. But when school was over, Prince went away with her, and Sophy stayed behind; for Miss Myrover was white and Sophy was black, which they both understood perfectly well. Miss Myrover taught the colored children, but she could not be seen with them in public. If they occasionally met her on the street, they did not expect her to speak to them, unless she happened to be alone and no other white person was in sight. If any of the children felt slighted, she was not aware of it, for she intended no slight; she had not been brought up to speak to negroes on the street, and she could not act differently from other people. And though she was a woman of sentiment and capable of deep feeling, her training had been such that she hardly expected to find in those of darker hue than herself the same susceptibility--varying in degree, perhaps, but yet the same in kind--that gave to her own life the alternations of feeling that made it most worth living.

Once Miss Myrover wished to carry home a parcel of books. She had the bundle in her hand when Sophy came up.

"Lemme tote yo' bundle fer yer, Miss Ma'y?" she asked eagerly. "I'm gwine yo' way."

"Thank you, Sophy," was the reply. "I'll be glad if you will."

Sophy followed the teacher at a respectful distance. When they reached Miss Myrover's home Sophy carried the bundle to the doorstep, where Miss Myrover took it and thanked her.

Mrs. Myrover came out on the piazza as Sophy was moving away. She said, in the child's hearing, and perhaps with the intention that she should hear: "Mary, I wish you wouldn't let those little darkies follow you to the house. I don't want them in the yard. I should think you'd have enough of them all day."

"Very well, mother," replied her daughter. "I won't bring any more of them. The child was only doing me a favor."

Mrs. Myrover was an invalid, and opposition or irritation of any kind brought on nervous paroxysms that made her miserable, and made life a burden to the rest of the household; so that Mary seldom crossed her whims. She did not bring Sophy to the house again, nor did Sophy again offer her services as porter.

One day in spring Sophy brought her teacher a bouquet of yellow roses.

"Dey come off'n my own bush, Miss Ma'y," she said proudly, "an' I didn' let nobody e'se pull 'em, but saved 'em all fer you, 'cause I know you likes roses so much. I'm gwine bring 'em all ter you as long as dey las'."

"Thank you, Sophy," said the teacher; "you are a very good girl."

For another year Mary Myrover taught the colored school, and did excellent service. The children made rapid progress under her tuition, and learned to love her well; for they saw and appreciated, as well as children could, her fidelity to a trust that she might have slighted, as some others did, without much fear of criticism. Toward the end of her second year she sickened, and after a brief illness died.

Old Mrs. Myrover was inconsolable. She ascribed her daughter's death to her labors as teacher of negro children. Just how the color of the pupils had produced the fatal effects she did not stop to explain. But she was too old, and had suffered too deeply from the war, in body and mind and estate, ever to reconcile herself to the changed order of things following the return of peace; and with an unsound yet not unnatural logic, she visited some of her displeasure upon those who had profited most, though passively, by her losses.

"I always feared something would happen to Mary," she said. "It seemed unnatural for her to be wearing herself out teaching little negroes who ought to have been working for her. But the world has hardly been a fit place to live in since the war, and when I follow her, as I must before long, I shall not be sorry to go."

She gave strict orders that no colored people should be admitted to the house. Some of her friends heard of this, and remonstrated. They knew the teacher was loved by the pupils, and felt that sincere respect from the humble would be a worthy tribute to the proudest. But Mrs. Myrover was obdurate.

"They had my daughter when she was alive," she said, "and they've killed her. But she's mine now, and I won't have them come near her. I don't want one of them at the funeral or anywhere around."

For a month before Miss Myrover's death Sophy had been watching her rosebush--the one that bore the yellow roses--for the first buds of spring, and when these appeared had awaited impatiently their gradual unfolding. But not

INTRODUCTION

Fanciers have long felt the want of a work dealing in a popular manner with cats, and it was therefore with great pleasure that I undertook to write THE BOOK OF THE CAT, and to give the results of a long experience in as simple and interesting a form as possible, so that the book might be instructive to cat fanciers, and also readable to that portion of the community which loves cats for themselves and not only for their prizes and pedigrees. It is possible that the beautiful reproductions in this work may result in the conversion of some cat haters, who, seeing the error of their ways, may give poor puss a corner in their hearts. Dogs are more essentially the friends of men, and cats may be considered as the chosen allies of womankind.

In the past, as I have endeavoured to show, many noted celebrities of the sterner sex have shown a sympathetic feeling for the feline race. At the present time the number of men fanciers on our cat club lists and exhibitors at our shows tends to prove that the cat is gradually creeping into the affections of mankind, even in this busy work-a-day world. I have given a full description of the various breeds, and have suggested advice as to the feeding, housing, and general treatment of cats. The chapters on the management of shows, containing also simple rules for the guidance of exhibitors, will, I trust, prove useful and instructive.

In my work I have received most valuable assistance, for which I am deeply grateful, from Mr. H. Gray, the well-known veterinary surgeon, whose chapter on the diseases of cats will, I am sure, be very interesting to breeders and fanciers. To Mr. H. C. Brooke I must tender my sincere thanks for his chapter on foreign cats, and to Mr. E. N. Barker for his excellent survey of the American cat fancy, and to Mrs. Pierce for her notes on Maine cats. Mr. Robert Holding’s chapter on the anatomy of the cat, with its excellent diagrams, forms a valuable addition to the work. To Mrs. S. F. Clarke I am greatly indebted for the number of clever photographs with which she has so kindly supplied me.

To many of my “catty” friends I offer grateful thanks for interesting items, paragraphs, and pretty photographs; and last, but not least, I have to thank that veteran, Harrison Weir, for his kindly encouragement, and I feel I cannot do better than quote from his letter, received on the completion of my work—enclosing a few remarks for my preface:—

“Miss Frances Simpson has kindly dedicated her labour of love, the fascinating BOOK OF THE CAT, to me, and truly the honour is great. Words cannot convey my feelings, but out of its fulness the heart speaketh—Thanks! I carry my mind back to the long, long ago, when the cat was a god or ideal, and worshipped. Then later, ‘our gentle Will’ called it ‘the harmless, necessary cat,’ and that it has ever been, and more than that to many. It is a lonely home without a cat; and for awhile—and I hope for long—cats are the fashion. Thirty years ago it was apparent to me that cats were not valued at their true worth, and then I suggested a show of cats! Let anyone try to start anything new, though novelty is said to charm! Many were the gibes, jokes, and jeers that were thrown at me

then. But nothing succeeds like success. Now, if I may without offence say a few words as to present-day shows, it is that they have not answered my expectations. Why? Because particular breeds are catered for and run after. Why such breathless talk all about long-haired cats, be they blues or silvers? This is not cat breeding. I want, I wish, and, if I live, I hope to see far more of the ‘harmless, necessary cat’ at our shows; for a high-class short-haired cat is one of the most perfect animals ever created.

“Far more I might, and perhaps am expected to add; but my life’s work is well-nigh done. He who fights honourably the good fight sinks at last. Miss Frances Simpson has rendered me her debtor; and others, beside myself, will tender her grateful thanks for her work in the cause of the cat and for the welfare of the fancy. Adieu!”

Mr. Harrison Weir’s words are precious to me, and now that my “labour of love” is ended I can only re-echo his wish and express a hope that the many pages I have devoted to the “harmless, necessary cat,” whose fireside friendship I have enjoyed all the years of my life, may awaken and arouse a greater interest in and admiration for these gentle, complex creatures, who in return for a little understanding will give a great deal of love.

FRANCES SIMPSON.

KENSINGTON, _August, 1903_.

THE BOOK OF THE CAT.

CHAPTER I. CATS OF THE PAST.

[Illustration:

MUMMY OF A CAT.

(_At the British Museum._)]

The origin of the cat has puzzled the learned, and the stock from whence it sprang is still, in the opinion of some, a mystery for the zoologist to solve.

Historians tell us that the feline race came into existence about the same time as the horse. Reference is made to the cat in Sanskrit writings over 2,000 years old, and still earlier records are found in the monumental figures, inscriptions, and cat mummies of ancient Egypt. These carefully-preserved relics of the past assist us in answering the question as to how this least tameable of animals became domesticated.

There are many legends concerning Puss and the manner in which she first sprang into existence. A surprising account of the cat’s creation is found in the works of an Arabian naturalist. It is as follows: “When Noah made a couple of each kind of animal enter the Ark, his companions, as well as the members of his family, said to him, ‘What security can there be for us and for the animals so long as the lion shall dwell with us in the same vessel?’ The patriarch betook himself to prayer and entreated the Lord God. Immediately fever came down from Heaven and seized upon the king of beasts, so that tranquility of mind was restored to the inhabitants of the Ark. But there was in the vessel an enemy no less harmful—this was the mouse. The companions of Noah called his attention to the fact that it would be impossible for them to preserve their provisions and their clothes intact. After the patriarch had addressed renewed supplications to the Most High, the lion sneezed, and a cat ran out of his nostrils. From that time forth the mouse became so timid that it contracted the habit of hiding itself in holes.”

[Illustration:

THE GOD CAT.

(_From an old Wood-cut._)]

So runs the legend, and in an old Italian picture representing the departure from the Ark we may observe a big brindled cat leading the procession of animals with an air of dignity and self-satisfaction. According to the Arabic scholar Damirei, there was no cat in the Garden of Eden. It is a singular fact that nowhere in the canonical books of the Old Testament nor in the New Testament is the cat mentioned, and if we take into consideration the number of books connected with the life, manners, customs, and religions of the Egyptians, this omission is the more striking. The only Biblical reference to cats occurs in the Book of Baruch, chap, vi., v. 22. This is a letter by Jeremy to the Children of Israel, who were taken captive by Nebuchadnezzar to Babylon. Some Hebrew scholars have asserted that the animals that prowled and cried among the ruins of Babylon were jackals, and not cats.

But however much the origin of the feline tribe is wrapped in mystery, we are certain that more than 3,000 years ago the cat lived and was loved along the banks of the Nile. The ancient city of the Pharaohs paid her homage; she was admitted into the ranks of sacred animals, she was worshipped in the temples. Jewels were placed in her ears and necklaces about her neck. Figures of cats were kept in the home and buried in the tomb. Trinkets representing both the goddess and the cat were worn upon the person, to indicate special devotion on the part of the wearer.

There seems but little doubt that the ancient and well-beloved cat of the Egyptians was a barred or marked animal, answering to some extent to our homely tabby. Paintings and statuettes of this type frequently occur, and therefore we may it take for granted that the Egyptians, who were so realistic and true to Nature when dealing with the animal world, would have presented cats of other species had they existed.

According to the historian, animal worship was first introduced into Egypt by Chores, the second king of the Second Dynasty.

[Illustration:

AN EGYPTIAN WALL-PAINTING: THE ADORATION OF THE GODDESS PASHT.

(_British Museum._)]

The Egyptians made gods of many living creatures of all kinds, amongst others the bull, the crocodile, the ibis, the hawk, the beetle, and the asp; but the cat appears to have held the highest place in their hearts. Not only was it preserved from injury, beloved and venerated during life, but at its death it was buried with all respect, and everyone mourned for it with outward and visible signs of grief, even to the extent of shaving off their eyebrows. The Egyptian’s idea of a correct burial involved mummification, so that all the parts might be preserved and thus kept from annihilation against the day of resurrection. A rich man’s cat was very elaborately mummified. Different-coloured stuffs were twisted round and round the body, forming curious patterns in two colours. The head would be carefully encased and sometimes gilded; the ears were always standing upright. These curious mummies look something like bottles of rare wine done up in plaited straw. Sometimes the mummy would be enclosed in a bronze box with a statue of a cat seated on the top. Mummies of cats with painted faces have been found in wooden coffins at Bubastes, Speos, Artemidos, Thebes, and elsewhere. Here is an illustration of a kitten brought to me from the Boulak Museum. The picture gives but little idea of the care and neatness which must have been employed in wrapping up the dear little dead bodies. The linen used is of the finest. The ears of the tiny kitten are each separate and distinct, and the muzzle of the creature shows distinctly through the delicate wrappings. Scarcely a good museum in the country now that has not some specimens of cat mummies. In some of these we notice that eyes have been added after the mummy has been encased and the embalmment completed. Most of the cats that died in the far-away time were thus embalmed and sent for burial to the holy city of Bubastes, near Thebes, on the banks of the Nile.

[Illustration:

MUMMIFIED KITTEN.

(_In the possession of Miss Simpson._)]

The Temple of Bubastes, according to Herodotus, was the fairest in all Egypt, and here special reverence was paid the cat. The local goddess of this city was Pasht, who was represented as a woman with a cat’s head. Cats were kept in the temples sacred to them, and doubtless the head cat of the Pasht’s temple was a very splendid specimen, who, living the life of great luxury, would be buried with the pomp and magnificence of a royal personage.

[Illustration:

THE WORSHIP OF PASHT IN THE TEMPLE OF BUBASTES.

(_British Museum._)]

[Illustration:

A CAT GOD OF EGYPT.

(_From the British Museum._)]

It was at Bubastes, on the banks of the Nile, that an annual festival in honour of the goddess Pasht was held. We are not told whether the cats took any part in the proceedings. From the towns and villages within hail, pleasure parties were sent in boats up and down the river to the city, and on their passage the men and women who crowded these boats made merry all the long summer day. The women clashed their cymbals and danced, and the men played on their flutes. Seventy thousand people, it is said, assembled at this feast, and they sacrificed victims and drank a good deal of wine. Perhaps the cats were treated to an extra dish of some dainty to mark this red-letter day in the annals of their patroness and goddess.

A curious custom, which probably had its origin in these pilgrimages to the sacred shrine, had until recent years survived amongst the Egyptian Moslems, who when they were starting on their way to Mecca always set apart one camel for the conveyance of several cats, and some ancient dame was told off to take charge of the precious animals. She was honoured with the title of “Mother of Cats.” Her office was not an enviable one, and probably it was found that a woman was unable to wrestle satisfactorily with the refractory travellers, for at a later date a man was substituted to carry the pussies to the Holy City.

[Illustration:

PUSS AS A RETRIEVER: AN EGYPTIAN WALL-PAINTING.

(_At the British Museum._)]

Thebes appears to have been a favourite burying-place for cats, and also a place called Beni Hasan, one hundred miles from Cairo. A few years ago some excavations were made near this town, and thousands of little mummied bodies were found that had rested peacefully for centuries. Their graves were desecrated, their burying ground plundered, and tons and tons of mummied forms were carted away to the neighbouring fields to serve the useful, if not romantic, purpose of manure! According to Horopollo, the cat was worshipped in the temple of Heliopolis, because the size of the pupil of the animal’s eye is regulated by the rising and waning of the sun. Plutarch, however, states in his treatise on “Isis and Osiris” that the image of a female cat was placed at the top of the sistrum as an emblem of the moon. “This,” says the historian, “was on account of the variety of her fur, and because she is astir at night; and furthermore, because she bears firstly one kitten at a birth, and at the second two, at the third three, and then four, and then five, until the seventh time, so that she bears in all twenty-eight, as many as the moon has days. Now this, perchance, is fabulous, but ’tis most true that her eyes do enlarge and grow full at the full moon, and that on the contrary they contract and diminish at the decline of the same.”

Among other fables of classic naturalists and historians may be mentioned the following by Herodotus: “If a fire occurs, cats are subject to supernatural impulses; and while the Egyptians ranged in lines with gaps between them, are much more solicitous to save their cats than to extinguish the fire, these animals slip through the empty spaces, spring over the men’s shoulders, and fling themselves into the flames. When such accidents happen, profound grief falls upon the Egyptians.”

Whether these frenzied cats did or did not commit suicide is open to doubt, but that they would plunge fearlessly into water is an acknowledged fact. This is attested by paintings representing sporting scenes in the valley of the Nile. Men and women used to go out on fowling excursions in a boat to the jungles and thickets of the marsh land, or to lakes in their own grounds, which abounded with wild fowl, and there among the tall reeds knock down the bird with a stick. Into these happy hunting grounds they took a cat who would jump into the water and retrieve the game as it fell. There is a painting taken and brought from a tomb in Thebes, which is now in the British Museum, and Wilkinson, in his “Manners and Customs of Ancient Egyptians,” writes as follows: “A favourite cat sometimes accompanied the Egyptian sportsmen on these occasions, and the artist intends to show us, by the exactness with which he represents the animal seizing the game, that cats were trained to hunt and carry the water-fowl.”

[Illustration:

AN EGYPTIAN TOY CAT.

(_At the British Museum._)]

One of the earliest representations of the cat is to be found in the Necropolis of Thebes, which contains the tomb of Hana, who probably belonged to the Eleventh Dynasty. There is a statue of the king standing erect, with his cat Bouhaki between his feet. The large basalt statues, of which there are so many in the British Museum, both seated and standing, are examples of great interest. They have mostly the disc of lunar divinity above their heads and the royal asp above the forehead.

M. Champfleury, in his delightful book, “Les Chats,” gives a good deal of information regarding the cats of ancient Egypt, and mentions the existence of funerary statues of women which bear the inscription Techau, the cat, in token of the patronage of the goddess Bast. Frenchmen occasionally call their wives _ma chatte_ without attaching any hieratic association to that term of endearment.

According to ancient documents in the Louvre, we are enabled to surmise the name by which the cat was known in Egypt. It was Mau-Maï, Maau, or Maon. A tablet in the Berlin Museum, bearing the representation of a cat, dates from 1600 B.C., and another, two hundred years older, has an inscription in which the word “Mau” appears.

Amongst old Egyptian images in bronze and earthenware, we may often find the cat crouching with the symbolic eye, emblem of the sun, engraved upon its collar. In the British Museum there is a curious example of a toy in the shape of a wooden cat with inlaid glass eyes and a movable lower jaw well lined with teeth.

There is a tradition that Cambyses devised a scheme for the capture of the town of Peluse, which, if true, is one example among many of the devotion of the Egyptians to cats. It was in the fourteenth year of his reign that this king of Persia tried to effect an entry into Egypt, and he is said to have hit upon a clever strategy. Knowing that the garrison of the town was entirely comprised of Egyptians, he put at the head of his army soldiers each carrying in their arms a cat. The Egyptians, alarmed lest they might injure the sacred animals when destroying their enemies, consented rather to be vanquished. But for their scruples they might perhaps have repulsed the invaders, for the Persian soldiers could not well have done their share of the fighting while clasping in their arms restless and terrified cats!

It is strange that the cat was almost neglected by the Greeks and Romans. It is true that Grecian art working on such grand sweeping lines might fail to follow the insignificant yet graceful curves of the cat. Therefore no Greek monument is adorned with a figure of the idol of Egypt, and Homer never gives a passing mention of the cat. Among the Greeks the cat was sacred to the goddess Diana. Mythologists pretend that Diana created the cat in order to throw ridicule upon the lion, an animal supposed to have been called into existence by Apollo with the intention of frightening his sister. This he followed up by producing a mouse, which Hecate’s cat immediately ate up. A cat was often emblazoned on the shields and flags of Roman soldiers. That the cat was known at an early period in Italy we have proof in the curious mosaic in the Museum at Naples, which depicts one pouncing upon a bird. The date of this has been fixed at about one hundred years prior to the Christian era. In the Bordeaux Museum there is a tomb of the Gallo-Roman period with a representation of a girl holding a cat in her arms and with a cock at her feet. In those days the playthings and domestic animals belonging to children were buried with them.

From some of the oldest Indian fables we learn that the cat was domesticated in that country at a very early period. Her first appearance into China would seem to have been about 400 A.D. There is a curious ancient Chinese saying to the effect that “A lame cat is better than a swift horse when rats infest a palace.”

Amongst the curious freaks in the natural world are mineral _lusus_. These are stones, agates, or marbles, which, by the action of the soil, air, or water during thousands of years, have assumed various forms, which we may interpret to represent human heads, trees, animals, and so forth. This illustration of a mineral _lusus_ is taken on a reduced scale from a book by Aldrovandus, an Italian naturalist of the seventeenth century. The figure of the cat occurs, he says, in a slab of marble. It was also reproduced by Athanasius Kircher, the Jesuit, who copied many of Aldrovandus’s engravings.

[Illustration:

A MINERAL LUSUS.

(_From an old Engraving._)]

I think the most casual observer would pronounce this illustration to be the representation of a cat; and if, as we are led to believe, this and other figures are really the result of natural causes, we can only marvel at the wonderful correctness of outline and form in which through countless ages the substances comprising the specimen have arranged themselves.

We have no record that the cat became domesticated in Great Britain and France before the ninth century, when it would seem that she was by no means common, and considered of great value; for in the time of one of the old Princes of Wales, who died in 948, the price of a kitten before it could see was fixed at a penny, after it had captured a mouse, twopence; and if it gave further proofs of its usefulness it was rated at fourpence. This same prince, Howel the Good, issued an order that anyone who stole or killed a cat that guarded the prince's granary was to forfeit a milch ewe, its fleece, and lamb, or as much wheat as when poured on the cat suspended by its tail (the head touching the floor) would form a heap high enough to cover the top of the tail.

This is not only curious, as being an evidence of the simplicity of ancient customs, but it goes far to prove that cats were not aborigines of these islands. The large price set on them—if we consider the high value of specie at that time—and the great care taken of the improvement and breed of an animal that multiplies so quickly, are almost certain proofs of their being little known at that period. No doubt wild cats abounded in our islands, and this creature is described by Pennant as being three or four times as large as the house cat. The teeth and claws are, to use his expression, "tremendous," and the animal is altogether more robust. The tail of the wild cat is thick and as large at the extremity as it is in the centre and at the base; that of the house cat tapers to the tip. This ferocious creature, well named the British tiger, was formerly common enough in the wooded and mountainous districts of England, Scotland, and Wales, but owing to the attention paid to the preservation of game it has gradually become almost if not entirely exterminated. In olden times, when wild cats were hunted and captured, the principal use they were put to was to trim with their fur the garments of the ladies in the various nunneries scattered over the land. A writer of the Middle Ages says: "The peasants wore cat skins, badger skins, &c." It would appear that lambs' and cats' skins were of equal value at that period.

Harrison Weir, in his work on cats, tells us that in 1871 and 1872 a wild cat was exhibited at the Crystal Palace by the Earl of Hopetoun; he also mentions that as late as 1889 Mr. Edward Hamilton, M.D., writing to the _Field_, gives information of a wild cat being shot at Inverness-shire. He states: "A fine specimen of a wild cat was sent to me on May 3rd, trapped on the Ben Nevis range. Its dimensions were: from nose to base of tail, 1 foot; height at shoulders, 1 foot 2 inches." In July, 1900, a paragraph to the following effect appeared in the _Stock-Keeper_:—

"The Zoological Society have just acquired a litter of wild cats. This is the only instance where a whole litter has been sent to the Gardens. It was taken not far from Spean Bridge, Inverness-shire."

[Illustration:

PUSS IN WARFARE (_vide p. 8_).

(_From a 16th Century MS._)]

The late Professor Rolleston, in an article on the "Domestic Cats of Ancient and Modern Times" (_Journal of Anatomy and Physiology_), has well explained much of the confusion about cats in former writers and their so-called interpreters. He shows how loosely now, as long ago, the word "cat" and its classic equivalents may be employed. Just as we still speak of civet cats and martens. Up to the beginning of this century the wild cat was wrongly thought to be the original of the tame species. Yet apart from more exact evidence this is shown to be an error if we note the value set upon domestic cats in former centuries. The Rev. Dr. Fleming, in his "History of British Animals" (1828), points out some of the distinctions between the two species. He also alludes to the spotted variety, termed the Cypress Cat, as noticed by Menet, who wrote the earliest book on British Natural History in 1667.

"It is a curious fact," says Mr. J. E. Herting, an eminent naturalist, "that in Ireland, notwithstanding reports to the contrary, all endeavours to find a genuine wild cat have failed, the so-called 'wild cat' of the natives proving to be the 'marten cat,' a very different animal."

In the early Middle Ages, according to tradition, cats were utilised in a strange manner. The illustration on p. 7 depicts a German fortress which it was desired by the enemy to set on fire. Not being able, one may suppose, to effect this by treachery, the foes pressed into their service both biped and quadruped. On the back of the pigeon and cat alike, a flask of inflammable matter is attached, and furnished with a time fuse to ignite at the proper moment. There is a broad road for the cat to travel, and we must presume that the gate of the fortress was left open for her entrance. The pigeon would be supposed to cut the cord of the flask with her beak when just over the magazine and let it drop at an auspicious moment. This cut is reduced from a coloured drawing in an unpublished manuscript volume dated 1575, in which is a great variety of illustrations of fireworks for war and recreation.

It is strange that the cat, which was an object of worship and adoration to the Egyptians, should, during the long, dark years of mediæval history, be looked upon as a diabolical creature. The only pleasant legend handed down to us from the Middle Ages is that of “Dick Whittington and his Cat.” There are records to show that this worthy citizen was thrice Lord Mayor of London, and we have always been led to believe that it was to his cat he owed his wealth and prosperity. At all events, so long as London is London, Whittington will ever be associated with his cat.

Innumerable are the legends that gather round the cat during the Middle Ages. It was believed that the devil borrowed the coat of a black cat when he wished to torment his victims. Sorcerers pretended to cure epilepsy by the help of three drops of blood taken from the vein under a cat’s tail. At numerous trials for witchcraft, puss figured as the wicked associate of the accused. Cats were offered by sorcerers as oblations to Satan, and they were flung into the fire at the Festival of St. John. All praise to Louis XIII., who as the Dauphin interceded for the lives of these poor pussies thus annually sacrificed. It was thought to bring good luck to a house if a cat were cooked alive in a brick oven, and in Scotland she was roasted before a slow fire as a means of divining the future.

The mania of witchcraft had pervaded all ranks, even the holy profession, whose duty it should be to preach peace and goodwill. Hundreds of wretched old women were sent out of life “in a red gown” (the slang of that day for being burnt “quick” or alive), after undergoing the most excruciating tortures to make them confess the impossibilities for which they suffered.

In 1591, when King James of Scotland was crossing from Denmark, a great tempest arose at sea. This was supposed to have been caused by a “christened cat” being placed in the vessel by witches. The following is an extract from an old pamphlet: “Againe it is confessed that the said christened cat was the cause that the Kings Majestie’s shippe had a contrarie wind to the rest of the shippes in his companie, for when the rest of the shippes had a fair and good winde, then was the winde contrarie and altogether against his Majestie.” Thus, in the past as in the present day, blame was laid upon the poor harmless puss, where no blame was due.

In an old book called “Twenty Lookes over all the Roundheads of the World,” published in 1643, we read:—

[Illustration:

A GROUP OF CATS IN POTTERY.

(_From Figures in Cases at the British Museum._)]

“In the Reigne of Queene Mary (at which time Popery was much exalted) then were the Roundheads (namely, the monks and friars) so odious to the people, that in derision of them a cat was taken on a Sabbath day, with her head shorne as a Fryer’s and the likeness of a vestment cast over her, with her feet tied together, and a round piece of paper like a singing Celse between them; and thus was she hanged in a gallows in Cheapside, neere to the Crosse, in the Parish of St. Matthew. Which cat, being taken down, was sent to Doctor Pendleton (who was then preaching at St. Paul’s Cross), commanding it to be shown to the congregation. The Round-head Fryers cannot abide to heare of this cat.”

At the coronation of Elizabeth there is an account given, in the Hatton correspondence, of an effigy of the Pope being carried through the streets and afterwards burnt with several live cats, which, we are told, “squalled in a most hideous manner” as soon as they felt the fire.

After a famous French trial in the seventeenth century, a woman condemned as a murderess was hung in an iron cage over a slow fire, and fourteen poor unoffending cats were made to share the same fate. It is difficult to conceive by what train of thought civilised beings could arrive at such a pitch of wicked and horrible cruelty. Why should a gentle, shrinking, graceful little creature be thus made the savage sport of devils in human form?

There seems, however, to have been one haven of rest for poor persecuted pussy during the Middle Ages, and that was in the nunneries. Here, at least, she would be kindly treated, let us hope. It is said that this fact has something to do with the cat’s traditional association with old maids.

And now let us quit this dark page of history, where the shameful treatment of an innocent race makes the lover of the poor pussies sorrowful and indignant. It was in France that, after the period when the cat was given over to the ways of the witch and the sorcerer, we find her yet again taking her proper place in the home and the heart of the highest in the land. Writers of natural history and others frequently denounce the cat as an animal incapable of personal attachment, yet puss has wooed and won the friendship

and affection of many notable men.

Cats, the most politic, the most polite, and in proportion to their size the most powerful of beasts—realising almost literally Napoleon's favourite maxim, "Iron hand in velvet glove"—have the permanent fame of being loved by that most eminent of Frenchmen, Cardinal Richelieu, who delighted to watch the frolics of a number of kittens by which he was generally surrounded in his leisure hours. In this _tendresse_ he resembled a still more famous Churchman! A cat went to sleep once, we are told, on the sleeve of Mahomet's robe. The hour of prayer arrived, and he chose rather to cut away his sleeve than to disturb the slumbers of his beloved Muezza.

[Illustration:

TOMB OF A CAT WHICH BELONGED TO MADAME DE LESDIGUIÈRES.]

Chateaubriand makes frequent mention of the cat in his "Memoires." He received a present of a cat from the Pope. Moncrieff wrote a series of quaintly worded letters on cats, and the book has some curious illustrations. In this we read of the pussies of many grand dames of the French Court of that day. We give an illustration taken from this book, which represents the tomb of a cat which belonged to Madame Lesdiguières, and bears this inscription:—

UNE CHATTE JOLIE. Sa maitresse qui n'aima rien L'aima jusques à la folie. Pourquoi le dire? On le voit bien.

Moncrieff had to suffer an immense amount of ridicule on account of his charming "Lettres sur les Chats," which the author himself calls "a gravely frivolous book." Victor Hugo had a favourite cat he called "Chanoine," and Gautier's cat slept in his bed, and always kept him company at meals. Petrarch loved his cat as he loved his Laura. Dr. Johnson used to indulge his cat Hodge with oysters, which he would go out himself to purchase. Chesterfield provided for his cat in his will. Sir Walter Scott's love of dogs did not prevent him delighting in the company of a "conversable cat," and Hunse, of Hunsefield, seems to have possessed a large share of the great man's affection, and when he died his master wrote thus to Richardson: "Alack-a-day! my poor cat, Hime, my acquaintance, and in some sort my friend of fifteen years, was snapped at even by that paynim, Nimrod. What could I say to him, but what Brantôme said to some _ferrailleur_ who had been too successful in a duel: 'Ah, mon grand ami, vous avez tué mon autre grand ami.'" Amongst famous French novelists several have been cat lovers, especially Dumas, who in his "Mémoires" makes notable mention of "Le Docteur." Cowper, Shelley, Wordsworth, Swinburne, and Matthew Arnold all wrote lovingly of cats. But Shakespeare, although he makes forty-four distinct mentions of cats, never has a good word for poor pussy. In "All's Well that Ends Well" he gives vent to his dislike. Bertram rages forth:—

"I could endure anything before me but a cat, and now he's cat to me."

In "Cymbeline" occurs this passage:—"In killing creatures vile as cats and dogs"; and in "Midsummer Night's Dream" Lysander is made to exclaim:—"Hang off, thou cat, thou burr, thou vile thing."

Romeo cries out:—

"Every cat and dog And little mouse, every unworthy thing."

From these quotations alone we may infer that, at any rate, dogs and cats were not favourites with the great bard. There is only one mention of cats in Dante. He compares to cats the demons who, with their hooks, claw the "barterers" (_i.e._ abusers of their office as magistrates), when these sinners try to emerge from the hot pitch wherein they are punished. He says of one of these wretches:—"Tra male gatte era venuto il sorco." (_Inf. XXII._, 58.) Translation:—"Among wicked cats the mouse came."

In the "Westlosthcher Divan" of Goethe, written in his old age, but full of youthful spirit and of the freshest allusions to Eastern things, the cat is called one of the four "favoured beasts," _i.e._ animals in a state of grace, admitted into Paradise, in a verse very near the end of the poem, which being literally translated, reads thus:—

"This cat of Abuherriras" (a friend of the prophet Mahomet) "purrs about the Lord, and coaxes. Since he is ever a holy beast whom the Prophet stroked."

Robert Liston, who, as everyone knows, was the leading London surgeon in the middle of the nineteenth century, was passionately attached to his cat, and used to introduce it to his guests at the dinner parties which, according to the custom of a past generation, he gave his medical friends. On these occasions the cat would gravely walk round the dinner table during dessert to be admired by

the guests in succession, and it once happened that the top of its tail got into the wineglass of Dr. Anthony Todd Thoruson, Liston's famous colleague at University College Hospital. This man promptly struck the animal. Liston was so enraged that he started from his seat and denounced his guest in language more forcible than elegant.

Jeremy Bentham, who introduced by their names to Lord Brougham the cats seated on chairs round his table, deserves honour, not only as the foremost of modern jurists but also because, in his "Principles of Morals and Legislation," he had expressed better than others the claims of brutes to kind treatment.

The great scholar and eminent writer, St. George Mivart, has given the world a wonderfully comprehensive work on the Cat, and has used the maligned feline as his type for an introduction to the study of back-boned animals. It is he who remarks:—"We cannot, without becoming cats, perfectly understand the cat mind."

[Illustration:

THE CAT IN HERALDRY.

(_From Frank's Collection of Book Plates._)]

Perhaps the unkindest picture given to us of a cat is from the pen of the naturalist Buffon. "The cat" (says this unsympathetic student) "is an unfaithful animal, kept only from necessity in order to suppress a less domestic and more unpleasant one, and although these animals are pretty creatures, especially when they are young, they have a treacherous and perverse disposition, which increases with age, and is only disguised by training. They are inveterate thieves; only when they are well brought up they become as cunning and flattering as human rascals."

[Illustration:

THE PRINTER'S MARK OF MELCHIOR SESSA, OF VENICE.

(_From a Print at the British Museum._)]

Chateaubriand, referring to these scathing remarks, says:—"Buffon has belied this animal. I am labouring at her rehabilitation, and hope to make her appear a tolerably good sort of beast."

[Illustration:

A MERCHANT'S MARK.

(_From a Print at the British Museum._)]

A charming reference to the ways of cats occurs in a curious and interesting book by a once famous Jesuit, Father Bougeant, who lived in the first half of the eighteenth century. There is an English translation of this work, which has passed also into other languages and several editions. This is the passage translated:—

"Such is one of those big-whiskered and well-furred tom cats, that you see quiet in a corner, digesting at his leisure, sleeping if it seems good to him, sometimes giving himself the pleasure of hunting, for the rest enjoying life peaceably, without being troubled by the events which agitate us, without tiring his mind by a thousand useless reflections, and little caring to communicate his thoughts to others. Truly it needs only that a female cat (_une chatte_) come on the scene to derange all his philosophy; but are our philosophers wiser on such occasions?"

The cat, as the emblem of independence and liberty, has been used in heraldry, statuary, and signboards. In the sixteenth century a well-known firm of printers named Sessa, at Venice, adopted the device of a cat surrounded by curious ornamentation, and Dibdin in one of his works tells us that whenever you see Sessa's cat you may be sure the book is a good one and worth reading. Ever since the days when the Romans carried on their banners the design of a cat, this combative and courageous animal has been a favourite symbol of warriors and nobles. The wife of King Clovis, Clotilde, had a cat sable upon her armorial bearings, springing at a rat, and on the famous Katzen family's shield was a cat holding a mouse in its mouth. In Scotland the Clan Chattan was known by the emblem of a wild cat with the significant motto, "Touch not the cat, but" (meaning without) "the glove." Their chief was called Mohr au chat, or the great wild cat.

M. Champfleury, dealing with cats in heraldry, tells us that the French Republic resumed heraldic possession of the cat and added it to its glorious shield of arms; and an illustration is given in his book of the republican painter's figure of Liberty holding a pike surmounted with a Phrygian cap, and at her feet is seated a cat.

In past, rather than in present, days the cat was used on signboards, especially in France. We read of "La Maison du chat pelote" (_i.e._ which rolls itself up), and "La Maison du chat qui pêche." In the Lombards' quarter of Paris, "Le Chat Noir" was formerly a familiar figure above restaurants and confectioners. In England we often come across "The Cat and the Fiddle" as a signboard to old country village inns, and in Cassell's "Old and New London" a writer says:—"Piccadilly was the place in which 'The Cat and Fiddle' first appeared as a publichouse sign. The story is that a Frenchwoman, a small shopkeeper, had a very faithful and favourite cat, and that in lack of any other sign, she put over her door the words: 'Voici un chat fidèle.' From some cause or other, the 'Chat Fidèle' soon became a popular sign in France, and was speedily Anglicised into 'The Cat and Fiddle,' because the words form part of one of our most popular nursery rhymes."

[Illustration:

ALICE AND THE CHESHIRE CAT.

From "Alice's Adventures in Wonderland," by Lewis Carroll.

(_By permission of Messrs. Macmillan & Co., Limited._)]

Many are the popular traditions, maxims, proverbs, and superstitions connected with the cat. In olden days her every movement was looked upon as a sign of ill-omen or of good luck. Old nurses would drive a cat out of the bedroom with much significance of manner, that it might not "suck the child's breath." There is a superstition that a cat will not remain in a house with an unburied corpse.

M. Presse d'Aveunes gives an account of a curious cat superstition. "When a woman gives birth to twins, boys or girls, the last born of the two, whom they call 'barecy' (sometimes both), has at times, and it may be all its life long, an irresistible craving for particular eatables; and in order to satisfy more easily its gluttonous desires, it assumes the shape of different animals, and especially that of the cat. During the transmigration of the spirit into another shell, the human body is as a corpse, but when the spirit has satisfied its desires it retakes its proper form."

He continues: "Having one day killed a cat which had made inroads upon my larder, a druggist of the neighbourhood came to me in a great fright and entreated me to spare all animals, for he said he had a daughter who had the misfortune to be a 'barecy,' and that she was often in the habit of assuming the shape of a cat in order to eat the sweetmeats served at my table."

[Illustration:

A STUDY.

(_From the painting by Madame Ronner._)]

Milton tells us "that when the cat washes her face over her eares, we shall have a great store of raine." A cat sneezing is supposed to bring luck to a bride on her wedding day. Sailors have in all times been prone to superstition as regards cats. A black cat's appearance on the ship foretells disaster, but if a cat should disappear overboard the greatest consternation is caused amongst the crew.

Very plentiful are the nursery rhymes, fairy tales, and stories concerning cats—a good-sized book would not contain them. "The cat," says M. Champfleury, "is the nurse's favourite and the baby's earliest friend. It plays its part in little rhythmical dramas, cunningly presented to the drowsy child, who falls asleep with a familiar image parading fantastically through his brain." French nursery rhymes are much prettier than English. For instance, this bald and commonplace statement is not calculated to catch the attention of the juvenile mind:—

"Great A, little A, bouncing B, Cat's in the cupboard, and can't see me."

How much softer and daintier are the following lines:—

"A, B, C, Le chat est allé Dans la neige; en retournant Il avait les souliers tout blancs."

In passing, I should say it is strange that to the French a cat is always masculine, and to the English feminine.

In the days of good Queen Anne the story of pussy's venturesome journey to London was put into verse, and what child has not listened eagerly to these lines from that time down to our present day?

"'Pussy-cat, Pussy-cat, Where have you been?' 'I've been to London To see the Queen.'

"'Pussy-cat, Pussy-cat, What did you do there?' 'I frightened a little mouse Under her chair.'"

In "Alice in Wonderland" Lewis Carroll has given the world "a childish story" which will never cease to delight both young and old. In this we read of the "Cheshire Cat" which grinned down upon the guests assembled at the royal croquet party, and having incurred the anger of the Queen, was in danger of having its head cut off by order of the infuriated monarch. The other volume by the same author—"Alice Through the Looking-Glass"—opens with a description of the way in which Dinah the cat washed her children's faces:—"First she held the poor thing down by its ear with one paw, and then with the other paw she rubbed its face all over the wrong way, beginning at the nose." Then follows an animated conversation between Alice and the kitten. All the world knows of the love Lewis Carroll had for children, and I can assert he had an affection also for cats, for when a child he spoilt and petted me and my kitten. I only wish I could remember the deliciously impossible stories he was wont to tell me of fairies, goblins, and pussy-cats.

Harrison Weir, in his book on cats, has gathered together a number of curious cat proverbs. Some are very familiar, such as: "A cat may look at a king"; "Care will kill the cat"; "When the cat is away the mice will play," and a very significant one is: "When the maid leaves the door open the cat's in fault." The quaint saying, "When candles are out all cats are gray" is a very expressive one.

When we consider the cat in art, it is among Eastern painters we find the most delicate and skilful studies. Next to the Egyptians, the Chinese and Japanese have excelled in the artistic treatment of animals. In many of the Dutch interiors given to us by Flemish artists, the domestic cat may be seen curled up on the hearth, or sitting erect, bearing somewhat the appearance of being stuffed with bran.

[Illustration:

MADAME RONNER AT WORK.

(_Photo: Alexandre, Brussels_)]

In many of the early Italian sacred pictures we find the cat depicted, but great painters, like Titian, Velasquez, and Murillo, seem to have preferred the dog as an adjunct to their portraits. Raphael and Salvator both considered puss a worthy subject for their brush. In M. Champfleury's interesting book on cats he gives a facsimile from the powerful pencil of Mind, whom Madame Lebrun has termed "the Raphael of Cats." The attitudes are so true to nature that the cat seems alive. Mind was a native of Berne, and in 1809, on account of a scare of madness amongst cats, eight hundred were put to death. This was a heartbreak to the cat-loving painter, who, however, managed to save his favourite pet Minette from the wholesale massacre.

Very quaint reproductions of cats have been made in the following wares: Whieldon, Salt Glaze, Agate, and Staffordshire. With Chinese and Japanese cat figures we are all familiar; they are grotesque rather than beautiful.

Coming down to the cat artists of the present day, we would mention Madame Henriette Ronner, who has justly deserved the great reputation that she has acquired in her own country as well as ours. It is in depicting kittens in their ever-varying moods that Madame Ronner most excels. Whether playing havoc with antique lace, as in "Un Bout de Toilette," scattering an artist's materials, as in "Mischief," or dragging jewels from a casket, her kittens are instinct with vitality, and are portrayed in a manner implying knowledge of their anatomical structure, as well as in a most appreciative perception of their youth and beauty. Most lovers of cats are acquainted with Madame Ronner's artistic volume containing so many faithful and lovely reproductions of several of her best pictures, and an interesting account of her life and work written by Mr. M. H. Spielmann.

Another famous painter of cats is M. Eugène Lambert, who may be said to divide the honours with Madame Ronner in portraying with fidelity and artistic taste the feline race. Among English animal painters we have none who can come anywhere near to these two celebrated French artists in their marvellous delicacy of touch and subtle skill in depicting cat and kittens.

In these latter days who is there amongst us, young and old, who has not enjoyed a hearty laugh over the comical cats of Louis Wain? In his particular line, he is unique, for no one has ever portrayed cats in such various attitudes and with such deliciously expressive countenances. The adjectives and adverbs of the Cataract of Lodore would not suffice to describe the varied emotions

of these funny felines. A Christmas without one of Louis Wain's clever catty pictures would be like a Christmas pudding without the currants!

[Illustration:

"CRYSTAL,"

THE PROPERTY OF MRS. FINNIE YOUNG. (_Photo: C. Reid, Wishaw._)]

To Harrison Weir cats and cat lovers owe a debt of gratitude. He has done much to raise the standard of the feline race, and in his excellent book called "Our Cats," he thus writes in his preface:—

"Long ages of neglect, ill treatment, and absolute cruelty, with little or no gentleness, kindness, or training, have made the cat self-reliant; and from this emanates the marvellous powers of observation, the concentration of which has produced a style analogous to reasoning, not unmixed with timidity, caution, wildness, and a retaliative nature. But should a new order of things arise, and it is nurtured, petted, cosseted, talked to, noticed, and tamed with mellowed firmness and tender gentleness, then in but a few generations much evil that bygone cruelty has stamped into its wretched existence will disappear, and it will be more than ever, not only a useful, serviceable helpmate, but an object of unceasing interest, admiration, and cultured beauty, and thus being of value, it will be profitable."

It was Harrison Weir who instituted and carried out the first Cat Show held at the Crystal Palace in 1871, and since then he has taken an active part in the cat world. Of late years, however, he has been failing in health, and it was suggested that some testimonial should be offered to him in his declining years by his many admirers and cat-loving friends.

Our Cats, that popular weekly publication, opened a list in their columns, the result being a handsome piece of plate, which the veteran F.R.H.S. was asked to accept. In his reply acknowledging the gift, he writes:—"Kindest and best wishes to those warm-hearted and truly unforgetful friends who have contributed towards the very handsome testimonial." Then he goes on to allude to the first cat show and to his prophecy regarding the growing popularity of the cat family:—"Did I expect the outcome to be what it is? Yes, and no. I fully expected large shows and more of them, and a 'Cat Press,' and in the papers cat columns for the universal and worthy favourite cat. But in another way I am disappointed, and that is for the neglect of the short-haired English cat by the ascendancy of the foreign long-hair. Both are truly beautiful, but the first in intelligence, in my opinion, is far in advance of the latter." Therefore, with a hope that Harrison Weir may yet live to see the English short-haired cats still more widely loved and appreciated, and given better classification at our shows, I will pass on to my chapter on present-day cats and cat clubs, and the many other institutions and societies which are the outcome of the rapid strides that have been made in the cat fancy since the day when Harrison Weir was laughed at by his incredulous and astonished railway companion as they travelled together to the first Cat Show held at the Crystal Palace in 1871.

CHAPTER II. CATS OF TO-DAY.

The term "Cat" is applied in its widest sense to all feline animals. The following are the various names by which the cat is known in different countries, and it is curious to note that, with two exceptions, they all begin with a "C" or a "K" and differ very little in pronunciation: Irish and Scotch, _Cat_; French, _Chat_; Dutch, _Kat_; Danish, _Kat_; Swedish, _Katt_; German, _Katti_ or _Katze_; Italian, _Gatto_; Portuguese and Spanish, _Gato_; Polish, _Kot_; Russian, _Kots_; Turkish, _Keti_; Welsh, _Cetti_; Cornish, _Katt_; American, _Katz_.

[Illustration:

MISS F. SIMPSON'S "BONNIE BOY."

(_Photo: Gunn & Stuart, Richmond._)]

In the English house and home we call her "puss," and it is the name which appeals most to our hearts. No woman likes to be called a "cat," but to be likened to a puss or pussy is suggestive of something or someone soft and pretty, with gentle, winning ways. Archbishop Whately has said that only one English noun had a true vocative case, "Nominative, cat; vocative, puss." I do not think that in any other country there is a pet name for the cat, just as there is no word in any foreign language that breathes the same tender truth to the hearts as "home." Puss and home! The terms seem so closely connected with each other, and suggest peaceful happiness and restful repose.

Truly, the history of the cat has been a strangely chequered one. Perhaps, because she is such a secret, complex, and independent creature she has remained somewhat of a puzzle to humankind, and is therefore to a great extent misunderstood; but those who will take the trouble to consider the cat and try to understand her, will find that puss is none of those things she has been accused of being. It is only those who are in constant contact with cats who understand how intelligent they really are; although their intelligence is quite in a different mould from that of the dog. I may mention that the household cat outnumbers, it is said, the household dog in London by the proportion of four to one. This fact may be accounted for by the non-taxation of cats. The question of the taxation of cats has very often been raised, and I do not think that anyone who really values his cat would object to pay a yearly tax; but the proposal is as unpractical as it is ridiculous, and it is certain that taxation would not help in exterminating the poor, disreputable, half-starved members of the feline tribe, who have no fixed abode and whose only means of existence is by plunder.

The figure and number nine seems to be an important one in connection with cats. There is a popular saying that a cat has nine lives. The expostulating tabby in Gay's Fables says to the old beldame:—

"'Tis infamy to serve a hag, Cats are thought imps, her broom a nag; And boys against our lives combine, Because, 'tis said, your cats have nine."

Cats probably owe this reputation to their extraordinary powers of endurance, and certain it is that they have a greater tenacity to life than any other animal. At the Battersea Home a dog and a cat have been placed in the lethal chamber, and it was observed that the dog died in five minutes, whereas the cat breathed for forty minutes longer. A short time ago I received the following letter from a cat fancier:—

"At 11 p.m. two kittens, a few hours old, were placed in a pail of water, and left there for rather over ten minutes. Seeing them at the bottom with their mouths open, it was taken for granted they were dead; the bodies were then transferred to the ashpit, and early next morning they were discovered to be alive and quite chirpy. Restoring them to the mother, they have grown nice, strong, healthy little kits, and have just left for comfortable homes."

In Thistleton Dyer's interesting book on "English Folk-lore," reference is made to this subject. "Cats," he says, "from their great suppleness and aptitude to fall on their feet, are commonly said to have nine lives; hence Ben Johnson, in 'Every Man in his Humour,' says, ''Tis a pity you had not ten lives—a cat's and your own.'"

"In the Middle Ages a witch was empowered to take cat's body _nine_ times," so writes an eminent old zoologist.

KITTEN AT WORK AND PLAY.

(_Photo: C. Reid, Wishaw._)]

The "cat-o'-_nine_-tails" is a dreaded object to some light-fingered and heavy-handed miscreants. I have heard a magistrate remark that he considers this form of punishment the best way in which to give hints to the wicked. Garrotting was virtually stamped out by its use. Wife-beating would be less common if the brute-husband were treated to a taste of the cat-o'-nine-tails. This implement of torture consists of nine pieces of cord put together, and in each cord are nine knots. Consequently every stroke inflicts a large number of long and severe marks not unlike the clawing and scratching of a savage cat, producing crossing and re-crossing

wounds.

[Illustration:

KITTEN BELONGING TO MRS. E. S. OWEN, DETROIT, MICHIGAN.

BY “KING OF THE SILVERS”—“BLESSED DAMOZEL.” (_Photo: Albany Art Union, New York._)]

In my long and varied experience of cats, I have noticed that more of these creatures succumb to the common enemy at about _nine_ years of age than at any other period. We have heard of cats attaining the age of twenty years, but the following account surpasses all previous records of longevity in the feline world:—

TO THE EDITOR OF THE _Stock-Keeper_,

Sir,—Seeing you have a column in your paper devoted to cats, I thought it might interest your readers to hear that in our village there is a cat thirty-one years old. She is quite lively, and looks like living a few more years. It belongs to a poor widow, who told me she had it as a kitten when she married. (Her husband lived twenty-seven years, and has been dead four.)

Newbury, Bucks. W. B. HERMAN.

It is strange that the poor dead bodies of cats have often been used as objects of foolish and vulgar so-called sport. Dead cats and rotten eggs were, and are sometimes still, considered legitimate missiles to make use of at borough and county elections.

All sorts of stories are related of pussy’s superhuman intelligence, but the most uncanny one of very recent date I will refer to here. It may be remembered that in the winter of 1901 a vessel named the _Salmon_ was wrecked. On the morning of the accident, this vessel was lying alongside the _Sturgeon_, and her two cats, who had all their lives shown the most perfect contentment with their home and surroundings, made desperate efforts to get on board the _Sturgeon_. The crew drove them off again and again, and the ship’s dog attacked them, but they would not be deterred, and when the _Salmon_ at last cast off, the two cats landed with one frantic and final spring on to the _Sturgeon’s_ deck. It seems absurd to argue that those cats knew of the coming disaster, yet why should they take such a sudden and utterly unreasonable aversion to the ship which had always been their home? And why should they insist on making their way to another vessel from which they had been so inhospitably repulsed?

We have many proofs of the extraordinary extent to which a cat’s sense of hearing and smell are developed. On my voyage out to Australia flying fish would sometimes fall on to the deck. The cats that are always somewhere about the ship might be comfortably curled up asleep below, but the peculiar sound would fetch them up in a great hurry, and they would rush to secure the prize. The crew used to amuse themselves sometimes by trying to imitate the noise in various ways to deceive them; but the cats were not to be “had”—they could distinguish the peculiar thud of the flying fish from all other sounds.

[Illustration:

THE ANTIQUARIES.

(_From the painting by Madame Ronner._)]

Various theories have been put forward to account for the marvellous instinct which a cat possesses, enabling her to find her way home although miles and miles of untraversed country lay between her and the place from which she has been taken. It is contended that a cat which is conveyed in a bag or blindfolded will have its sense of smell in full exercise, and will, by this means take note of the successive odours encountered on the way, and that these will leave in its mind sufficient information of the route so as to make it an easy matter for the animal to find its way back again. Be this as it may, many of us can state facts which are even stranger than fiction of mysterious reappearances of cats who, with a homing instinct as true as any carrier-pigeon, return to the haven where they would be.

[Illustration:

“KEPWICK VIOLET” and “KEPWICK HYACINTH.”

BLUES BELONGING TO THE HON. MRS. MCLAREN MORRISON. (_Photo: J. R. Clarke, Thirsk._)]

The instinct of maternity is, perhaps, more largely developed in the cat than in any other animal. No creature shows such anxiety for the safety and welfare of her offspring as she does, and often her natural timidness will give place to bold and fearless courage when her little ones have been in any difficulty or danger. Mivart tells us of a cat that plunged into a swiftly running stream and rescued her three drowning kittens, bringing them one by one in safety to the shore. During a fire in a London theatre, which took place a few years ago, a poor cat with her family was left forgotten at the back of the stage. Three times the faithful mother rushed into the flaming building and reappeared each time with a kitten in her mouth. But alas! with fatal persistence the devoted creature returned to rescue the remaining one, and that she reached the spot was proved, for after the fire was extinguished, the charred bodies of mother and child were found lying side by side.

A clever writer has stated that “the human race may be divided into people who love cats and people who hate them; the neutrals being few in numbers.” This is very true. There are also differences of opinion as to whether cats are desirable inmates of a household or not, but there can be no question as to the great utility of these animals, and it is only natural to suppose that they were created for the purpose of suppressing rats and mice and other vermin. There is a popular notion that if a cat is petted and well fed she will become less useful as a mouser. This is a fallacy, for the cat’s inclination is to hunt the mouse or rat, not for food, but for sport, and an animal that is enfeebled by neglect and starvation is not in the best condition to successfully catch its prey. This love of sport is not, however, inherent in all cats, but is hereditary in the feline tribe as it is in the human race.

It may not be generally known that the Government pays annual sums for the purpose of providing, keeping, and feeding numerous “harmless, necessary cats” in their public offices, dockyards, and stores, thereby attesting to the worth and capability of pussy’s services.

In the National Printing Office in France a considerable number of cats are employed in keeping the premises clear of rats and mice which would otherwise work havoc amongst the stock of paper always stored in large quantities. In Vienna, cats are placed on active service in the municipal buildings. At many of our great railway stations there is a feline staff engaged in the various warehouses and offices. The farmer will readily admit the usefulness of puss in his barns, stables, outhouses and fields. Farmers are notorious grumblers, but they would have greater cause for discontent and disappointment if rats and mice were allowed to live and thrive, and breed and multiply on their premises. The newly sown peas and corn stacks would suffer to a terrible extent, and the broods of ducklings and chickens would speedily vanish if puss did not keep a vigilant eye and silently but surely fulfil the duties of her calling.

[Illustration:

MISS SAVERY’S BLUE PERSIAN KITTEN.

(_Photo: H. Warschawski, St Leonards-on-Sea._)]

In the live stock department of the Army and Navy Stores in London, an orange Persian cat may be seen strolling about amongst the cages of birds of every sort. The attendant informed me she had been on the premises three or four years, and had saved the company a “tidy sum.” Previous to obtaining her services the packets of bird-seed disappeared like magic, for they were demolished wholesale by the swarms of mice. Now rarely one is nibbled, and every morning dozens of lifeless bodies are cleared away. Curiously enough these dead mice have their tails eaten off, for apparently this cat has a weakness for the appendage, whereas, usually the head is considered the delicate morsel amongst the feline race. It seems that although the cat is left alone with all the fluttering birds at night, she never has attempted to molest them in any way.

[Illustration:

A PAIR OF SHORT-HAIRED BROWN TABBIES.

(_Photo: T. Fall, Baker St., W._)]

I lately had occasion to visit one of our London theatres during the daytime, when it was empty; and observing a big brown cat walking about amongst the stalls, I made some remark about him to the official who accompanied me. He said they found it quite impossible to get along without a cat; they had tried, but the place became overrun with mice. During pussy’s occupation of the empty playhouse plenty of bodies were discovered, but never a live mouse had been seen disporting itself.

The cats in Government service in America are very numerous. The army has a regular corps of them kept at the commissary depôts of the great cities. It is customary for the officer in charge of each depôt to submit to the War Department a request for an

allowance for the cats of meat and milk. More than three hundred cats are in the employ of the Post Office Department, distributed among about fifty of the largest offices. The New York City office expends sixty dollars annually in cats'-meat. At Pittsburg, there is a "cold storage" breed of cats, which has special qualifications for enduring extreme cold. These cats are short tailed, with long and heavy fur, and their eyebrows and whiskers are extraordinarily long and strong. It is said they do not thrive when transferred to an ordinary atmosphere.

[Illustration:

CAT CALENDAR.

(_By kind permission of Raphael Tuck & Co._)]

The following extract from the _Daily Mail_ of February 1st, 1902, gives us an account of a most exemplary, well trained, and up-to-date cat, and opens up a fresh field for the utility and agility of our domestic pets—not an absolutely fresh field indeed, if one recalls the fact that Puss was already a "retriever" in ancient Egypt.

A PING-PONG CAT.

Hunting for balls is undoubtedly the one great drawback to ping-pong. Might I suggest a novel and easy method of accomplishing this difficult and unpleasant task?

My cat is now an expert in the art of finding ping-pong balls. Immediately the ball touches the floor the cat is after it, and brings it from its hiding-place to the side of the table at which I am playing, thus saving me from unnecessary exertion.

F. S. W.

The thought suggests itself that pussy's teeth and claws might work serious havoc amongst the ping-pong balls, and that some of these would be produced in a mutilated condition.

Of all animals the cat appears most to resent being taught or trained to do tricks. Puss has a natural antipathy to be forced to do anything, or remain anywhere against her will. Hence the few exhibitions of really clever performing cats in comparison with the marvellous feats achieved by dogs. It has been stated that the cat is the hardest animal to teach; it takes years to train a cat to perform some simple trick which a dog would learn in as many weeks. Once a cat is trained, it becomes a very valuable possession. We have all seen the Happy Family, consisting of monkeys, guinea-pigs, canaries, pigeons, and mice, whilst a cat is seated demurely in the midst of this incongruous assembly. No doubt some training was required to cause puss to disregard the natural instincts of her race.

The cat is a most cleanly creature, and perhaps more particular about her appearance than any other animal. As Miss Agnes Repplier, in her delightful book, "The Fireside Sphinx," says: "Pussy's adroitness is equalled only by her delicacy and tact. Her cleanliness and her careful attention to her toilet show respect for herself and for us."

[Illustration:

CAT CALENDAR.

(_By kind permission of Raphael Tuck & Co._)]

One of the strangest and most profitable trades in London is the wholesale and retail business of horsemeat for cats. In barrows and carts the hawkers of this horse-flesh cry their wares throughout the city and suburbs, and find a ready sale for them. It is stated that 26,000 horses, maimed, or past work, are slaughtered and cut up every year to feed our household pets. Each horse means on an average 275 pounds of meat, and this is sold by pussy's butcher in half pennyworths skewered on bits of wood. The magnitude of this trade can be estimated by the fact that it keeps constantly employed thirty wholesale salesmen. I may here mention that a cats'-meat men's supper was organised last year in London by the editor of _Our Cats_, assisted by Mr. Louis Wain and others; and a most successful entertainment was given at the City of New York Restaurant. The applications for tickets were so numerous that 400 men had to be refused; and when the 250 guests were seated, it was clearly proved that every available inch of accommodation had been utilised. Having been present, I can testify to the excellent supper and entertainment provided for the cats'-meat men of London.

[Illustration:

CAT CALENDAR.

(_By kind permission of Raphael Tuck & Co._)]

The most casual observer cannot have failed to remark the wonderful development of late years in “Catty” Christmas souvenirs, thus giving proof of the growth of love and admiration for pussy. We have cat almanacks, cat calendars, and cat annuals, and I can testify to the innumerable Christmas cards with designs of cats of all sorts and conditions which have found their way into my hands expressive of good wishes at the festive season.

The official mind would probably frown at the suggestion that the census returns should be enlivened with incidental humour. However, after the last census, the following statement appeared in the press:—

“An enumerator in going over a return paper found that the household cat had been included as a member of the family. It was described as ‘Jim,’ the relationship to the head of the family being ‘lodger.’ The entry then stated that he was of the male sex, single, aged one last birthday. His occupation was also given—‘mouse-catcher, worker on his own account.’”

A description of the ordinary domestic cat is hardly necessary, but before I pass on to mention matters of general interest concerning cats of to-day, I will give a quotation from a Board School boy’s essay, which speaks for itself:—

“The house cat is a four-legged quadruped, the legs as usual being at the corners. It is what is sometimes called a tame animal, though it feeds on mice and birds of prey. Its colours are striped, it does not bark, but breathes through its nose instead of its mouth. Cats also mow, which you have all heard. Cats have nine lives, but which is seldom wanted in this country, coz’ of Christianity. Cats eat meat and most anythink speshuelly where you can’t afford. This is all about cats.”

Perhaps my readers may think that after such a lucid description of the subject in hand, further comments are unnecessary!

I will proceed, however, to give a glance round at the Cat Fancy in general before mentioning particulars of Clubs and Cats of the present day. The question has often been asked whether the Cat Fancy will ever become as popular and fashionable as the breeding of dogs, poultry, and birds? I think this question may be answered in the affirmative, when we consider that during last year a dozen and more large cat shows have been held in different parts of England and Scotland, to say nothing of numerous mixed shows where a section for cats was provided. Every year the number of fanciers increases, and although this particular hobby is almost entirely confined to the gentler sex, yet it is really surprising to find how many more men are beginning to take an interest in the pussies, and are keenly excited in the winnings of the household pet or the king of the cattery. As a friend once said to me, “You know what men are; if only the cats win prizes, my husband does not mind, but it is a different matter if I return from a show with no award; then he declares we must get rid of all the cats!” I am afraid that cat fanciers must be looked upon as a rather quarrelsome set, and there is no doubt that petty jealousies and spiteful gossip retard in many ways the development and improvement of the fancy.

Another question that is often asked is whether cats can be made to pay—or, in other words, whether cat breeding is a profitable undertaking. From my own experience, which has extended over a number of years, I can unhesitatingly say I have derived not only much pleasure but a good deal of profit from keeping cats, and also I have started many friends in the fancy who have gone on and prospered. The dangers that beset beginners are many, and the chief difficulty is to know how to limit the number of our pussies and so avoid overcrowding, or retaining poor stock which will not prove creditable or profitable. Cat keeping on an extensive scale means a large outlay, followed by constant and untiring attention. I do not intend, however, in this chapter to enter into any details as to the care and management of cats, for this and other subjects connected with their interests will be fully dealt with later on.

[Illustration:

MR. HARRISON WEIR.

(_Photo: C. E. Corke, Sevenoaks._)]

In my preceding chapter I alluded to the first Cat Show held at the Crystal Palace in 1871. This exhibition of cats has become an annual fixture, and year by year greater interest has been manifested, better classification given, and a larger number of cats

exhibited. It was, therefore, considered advisable to have some definite organisation, and the National Cat Club was instituted in 1887, with Mr. Harrison Weir as president. I will now proceed to give a list, which I believe to be complete and correct, of the various other clubs and societies in England and America which have been organised and which are all at this present time in thoroughly good working order.

LIST OF CAT CLUBS AND SOCIETIES.

The National Cat Club, founded 1887. Hon. sec., Mrs. A. Stennard Robinson, 5, Great James Street, Bedford Row, London, W.C. Annual subscription, 1 guinea.

The Cat Club, founded 1898. Hon. sec., Mrs. Bagster, 15A, Paternoster Row, London, E.C. Annual subscription, 1 guinea.

The Northern Counties' Cat Club, founded 1900. Hon. sec., Mrs. Herbert Ransome, Altrincham. Annual subscription, 10s.

The Silver and Smoke Persian Cat Society, founded 1900. Hon. sec., Mrs. H. V. James, Backwell, near Bristol. Annual subscription, 5s.

Black-and-White Club. Hon. secs., Miss Kerswill and Miss White Atkins. Entrance fee, 1s.; annual subscription, 4s.

The Blue Persian Cat Society, founded 1901. Hon. sec., Miss Frances Simpson, Durdans House, St. Margaret's-on-Thames. Annual subscription, 5s.

The Siamese Club, founded 1900. Hon. sec., Mrs. Baker, 13, Wyndham Place, Bryanston Square, W. Annual subscription, 4s.; to working classes, 2s. 6d.

The Orange, Cream, Fawn and Tortoisshell Society, founded 1900. Hon. sec., Miss Mildred Beal, Ronaldkirk Rectory, Darlington. Annual subscription, 10s.

The Chinchilla Cat Club, founded May, 1901. Hon. sec., Mrs. Balding, 92, Goldsmith Avenue, Acton. Annual subscription, 5s.

The Short-haired Cat Club, founded 1901. Hon. sec., Mrs. Middleton, 67, Cheyne Court, Chelsea.

The Scottish Cat Club, founded 1894. Hon. sec., J. F. Dewar, 2, St. Patrick Square, Edinburgh. Annual subscription, 5s.

The Midland Counties Cat Club, founded at Wolverhampton, 1901. Hon sec., Miss Cope, 136, Bristol Road, Birmingham. Annual subscription, 5s.

The British Cat Club, founded 1901: Hon. sec., Sir Claude Alexander, Faygate Wood, Sussex. Subscription, 5s.

The Manx Cat Club, founded 1901. Miss Hester Cochran, Witchampton, Wimborne. Subscription, 5s.

The Beresford Cat Club (Chicago), founded 1899. President, Mrs. Clinton Locke; corresponding secretary, Mrs. A. Michelson, 220, East Sixtieth Street, Chicago. Annual subscription, resident members, 2 dollars; non-resident, 1 dollar.

The Chicago Cat Club, founded 1899. President, Mrs. Leland Norton, Drexel Kennels, Drexel Boulevarde, Chicago.

The Louisville Cat Club, founded 1900. Corresponding secretary, Miss E. Converse. Annual subscription, 50 cents.

The Pacific Cat Club, founded 1900. Corresponding secretary, Mrs. A. H. Brod, 114, Broderick Street, San Francisco. Annual subscription, 1 dollar.

The Atlantic Club, founded in New York, 1902. Corresponding secretary, Dr. Ottolengui, 80, West Fortieth Street, New York.

[Illustration:

MR. LOUIS WAIN.

(_Photo: Lascelles & Co._)]

Since the formation of the National Cat Club, many changes in its constitution have taken place. On the retirement of Mr. Harrison Weir from the presidency, Mr. Louis Wain was appointed, and still holds the office. The N.C.C. is fortunate in having so energetic a hon. sec. and treasurer as Mrs. Stennard Robinson, whose name is so well known in the "doggy" world. The following is a list of

officers of the National Cat Club at the time of writing, and a summary of the objects for which the Club was organised:—

THE NATIONAL CAT CLUB.

Patron.—H.H. Princess Victoria of Schleswig-Holstein.

President.—Her Grace the Duchess of Bedford.

Vice-Presidents.—The Right Hon. the Countess of Warwick, The Viscountess Maitland, The Marchioness of Dufferin and Ava, The Countess of Aberdeen, The Lady Hothfield, Lady Willoughby, Lady Reid, The Hon. Mrs. McLaren Morrison, The Lady Granville Gordon, Lady Decies, The Hon. Mrs. Baillie, Madame Ronner, Mr. Isaac Woodiwiss, Mr. Sam Woodiwiss.

Committee.—Louis Wain (President), Lady Decies, Lady Alexander, The Hon. Mrs. McLaren Morrison, Mrs. Vallance, Mrs. Balding, Miss Hamilton, Dr. Roper, Mrs. Herring, Mrs. Ransome, Mrs. G. H. Walker.

Hon. Sec. and Treasurer.—Mrs. A. Stennard Robinson, 13, Wyndham Place, Bryanstone Square, W. (Telegraphic address—“Bow-wow, London.”)

The National Cat Club was organised (1) to promote honesty in the breeding of Cats, so as to ensure purity in each distinct breed or variety; (2) to determine the classification required, and to encourage the adoption of such classification by breeders, exhibitors, judges, and the committees of all Cat Shows; (3) to maintain and keep the National Register of Cats; (4) to assist the Showing and Breeding of Cats, by holding Cat Shows under the best sanitary conditions, giving Championship and other prizes, and otherwise doing all in its power to protect and advance the interests of Cats and their owners.

The National Cat Club is also a Court of Inquiry and Appeal in all matters relating to Cats, or affecting the ownership of Cats, and so saves the expense to its Members of litigation.

The National Cat Club founded its Stud Book some twelve years ago, and it is the only reliable source of information concerning the pedigree of Cats. The Registration Fee is 1s. for the Register of Names, but for the Stud Book the fee is 5s. for _Approved_ Cats exhibited under N.C.C. Rules.

The two principal shows of the National Cat Club are held annually at the Botanical Gardens in connection with the Ladies’ Kennel Association in June, and at the Crystal Palace in October. In 1901 the total number of cats shown at the Palace was 601, and the entries numbered 1,021. There were 106 classes provided for long- and short-haired cats. The following is the definition of the classes:—

DEFINITION OF CLASSES.

Open Classes.—Open to all Cats, Prize-winners or Novices.

Limit Classes.—For Cats of any age that have not won Three First Prizes.

Novice Classes.—For Cats of any age that have never won a First Prize at any Show.

Special Novice Cats.—For Cats or Kittens over 6 months that have never won a Prize of any sort at a Crystal Palace Show.

Neuter Classes.—For Gelded Cats.

Stud Classes.—For Male Cats that have sired Kittens which are entered and on exhibition in this Show.

Brood Queen Class.—For Queen Cats whose Kittens are entered in this Show.

Selling Class.—For Cats of any colour or Sex to be sold at a price not exceeding 3 guineas in Long-haired or 2 guineas in Short-haired and Foreign.

Ring Class.—For Cats shown in collar, and lead.

Kitten Classes.—Single entries to be over 3 months and under 8 months, unless otherwise stated.

Brace.—For 2 Cats, age over 6 months.

Team.—For three or more Cats, age over 6 months.

No Cats can be entered in brace or teams unless also entered in one other class.

The money prizes in each class are First, £1; Second, 10s.; Third, 5s. The list of special prizes, including Challenge Trophies and medals, numbered 262 at the last Crystal Palace Show in 1901.

In addition to the two regular fixtures of the N.C.C., other cat shows are held in different places in connection with the Club and under its rules.

[Illustration:

LADY MARCUS BERESFORD.

(_From a painting by Edward Hughes._)]

The National Cat Club reigned alone until 1898, when Lady Marcus Beresford started and founded the Cat Club. This ardent cat lover has done more for pussy than anyone in the fancy. She is most lavish in her generosity and unwearying in her efforts to promote the welfare of the Club. It was Lady Marcus who first started the idea of holding cat shows in aid of charity. The Cat Club's first show, held at St. Stephen's Hall, Westminster, in 1899, was in aid of the Children's Guild of the Deptford Fund.

In 1900 the families of the soldiers and sailors who had fallen in the Transvaal were benefited to a large extent by the proceeds of the show. In 1901 the Children's Hospital, Great Ormond Street, was the charity selected to receive a handsome donation of £100. The Westminster shows have always been splendidly managed, a noticeable feature being the wonderful array of beautiful special prizes offered for competition. The following is the list of officials connected with the Cat Club:—

THE CAT CLUB.

(_Founded by Lady Marcus Beresford._)

The objects of the Club are the general good of the Cat, the promoting of true breeding of Cats, the holding of a Winter Show, so that Cats may be exhibited at their best, and taking other steps that shall be for the welfare of the Cat.

The annual Subscription is £1 1s., payable on election, and on the 1st of January in each succeeding year.

A Stud Book and a Register of Cats are kept by the Club.

Presidents.—Lily, Duchess of Marlborough; Edith, Duchess of Wellington; Lord Marcus Beresford.

Vice-Presidents.—Isabella, Countess Howe; Viscountess Maitland, Viscountess Esher, Lady Ridley, Lady de Trafford, The Hon. Mrs. Bampfylde, Lady Lister, Lady Gooch, Mrs. Barnet, Mrs. Alfred Bles, Mrs. Walter Campbell, Mrs. Chaine, Mrs. George Dawkins, Mrs. Cary Elwes, Mrs. C. Hill, Mrs. King, Mrs. Nicholay, Mrs. Tottie, Mrs. Peston Whyte, Lord Walter Gordon Lennox, A. E. Bateman, Esq., Colonel Chaine, Henry King, Esq.

Committee.—Lady Marcus Beresford, Mrs. Vary Campbell, Mrs. Dean, Mrs. Paul Hardy, Mrs. C. Hill, Miss Anderson Leake, Mrs. R. Blair Maconochie, Mrs. Neild, Mrs. Simon, Mrs. Mackenzie Stewart, Mr. L. P. C. Astley, Mr. Gambier Bolton, Rev. P. L. Cosway, Mr. W. R. Hawkins, Mr. E. W. Witt.

Hon. Treasurer.—Lord Marcus Beresford.

Hon. Secretary.—Mrs. C. J. Bagster, 15A, Paternoster Row, London, E.C.

[Illustration:

LITTER OF SIAMESE KITTENS.

BELONGING TO LADY MARCUS BERESFORD.

(_Photo: T. Fall, Baker St., W._)]

There is really ample room for two parent clubs, as the Fancy is making such rapid strides, and, no doubt, well-appointed shows with good classification do a great deal to benefit breeders and assist fanciers. Between the National Cat Club and the Cat Club there is one point of serious disagreement, namely, as regards registration. At present members are expected and required to register their cats in each club if they exhibit at the respective shows. It would be a great benefit to the cat world in general and to the exhibitor in particular if some arrangement could be made whereby one independent register should be kept, and that both clubs might work together and assist each other in endeavouring to scrutinise and verify all entries made in the joint register, so that inaccuracies should be detected and fraud prevented.

The Northern Counties Cat Club is affiliated with the N.C.C., and has quite a large number of members. This enterprising club holds two shows in Manchester every year, which hitherto have been capitally managed by the energetic hon. sec. As a natural sequence a Midland Counties Club has lately been started, having its working centre at Birmingham. No doubt arrangements will be made for holding a cat show in this or some other equally central Midland town.

The Scottish Cat Club is in a flourishing condition, and has been steadily working up members since 1894. A show is annually held in Edinburgh, and fanciers over the border are taking a much keener interest in cats.

In America the fancy has gone ahead in a wonderful way. It was in 1895 that the first cat show of general interest was held at Madison Square Gardens, New York. There had previously been some private attempts to have exhibitions of cats in connection with poultry and pigeon shows. In 1896 an American Cat Club was organised, which did some good work. Then Chicago started a Cat Club in January, 1899, and this was followed by a most successful enterprise on the part of Mrs. Clinton Locke, who founded the Beresford Cat Club, called after Lady Marcus Beresford, and now numbering about 200 members. In January, 1900, the club held its first big show. The classification was of a most comprehensive nature, and the list of special prizes a very liberal one. This show is now an annual fixture, and the Cat Club of England sends medals and prizes to be competed for. Many of the best cats exhibited at these shows have been exported from England, and Americans are very keen in trying to procure the very best possible stock—high prices in many cases being offered to induce English fanciers to part with prize-winning specimens.

The following is a list of officials of the

BERESFORD CAT CLUB OF AMERICA.

Officers.

Mrs. Clinton Locke, 2825 Indiana Ave., (_President_); Mrs. Charles H. Lane, 5323 Madison Ave., (_First Vice-President_); Mrs. F. A. Howe, 3941 Grand Boulevard (_Second Vice-President_); Mrs. A. A. Michelson, 220 E. 60th Street (_Corresponding Secretary_); Miss L. C. Johnstone, 5323 Madison Ave. (_Recording Secretary_); Mrs. Elwood H. Tolman, 5403 Madison Ave. (_Treasurer_).

Directors.

Mrs. J. H. Pratt, 5816 Rosalie Court; Mrs. Lincoln Nicholson, Lee Centre, Illinois; Miss Louise Fergus, 3229 Sheridan Road; Mrs. Blanch P. Robinson, 6, Langley Place; Mrs. Vincent E. Gregg, 736 North Park Avenue.

[Illustration:

“PUCK III.”

THE PROPERTY OF THE PRINCESS VICTORIA OF SCHLESWIG-HOLSTEIN.]

At the Cat Show held in January, 1902, as many as 75 classes were provided, and it is plain to see from these that Americans have not the same antipathy for broken colours—that is, cats with white markings—as we have in England, as there are classes specially for orange-and-white, and black-and-white cats. In another part of this work I shall refer to varieties and breeds of cats existing in America which differ from those in England. The Beresford Cat Club have an extremely well-arranged stud book and register, which is published annually. I am sure that the Cat Fancy in America has a great future before it, and we cannot help being greatly struck with the earnestness, thoroughness, and enthusiasm with which Americans have taken up this hobby. When we consider the great distances in the States and the paucity of good stud cats, and the few opportunities of exhibiting at well organised shows, we cannot fail to admire the energy and enterprise displayed by our American fellow fanciers.

Specialist Clubs for Cats are of very recent growth. The first was started by an ardent breeder of silver Persians in 1900. It was then called the Silver Society, and it included smokes and silver tabbies. The title of this society has since been changed to the Silver and Smoke Persian Cat Society. In the following year Blue Persian Breeders bestirred themselves and formed a society for this most popular breed. In the same year the Orange, Cream, and Tortoiseshell Society, the Siamese Club, and the Chinchilla Club were inaugurated, also a Manx Club came into existence, and two clubs for short-haired cats were started. Particulars concerning these specialist societies and their objects will be found in future chapters on the various breeds of cats. It will be noticed by the list of clubs given that for brown tabby and black-and-white Persians no societies have as yet been formed, but doubtless ere long these varieties will be gathered into the fold of specialist clubs.

A good deal of discussion has taken place in catty circles as to the desirability of having specialist societies, but I am sure a vast and marked improvement has taken place in the different breeds since their formation, and the fact of publishing a standard of points has certainly assisted breeders in coming to a more correct idea of what constitutes a good cat of a particular breed. The number of challenge prizes, medals and specials offered by these societies at various shows act as an incentive to exhibitors, and thus entries increase and competition becomes keener. Specialist clubs are not altogether popular with the parent clubs, who regard them with rather a suspicious and jealous eye. They think that exhibitors may join these less expensive societies and yet continue to show and win prizes without subscribing to the club that holds the show. No doubt there is something in this, and specialist clubs should be ready and willing not only to offer prizes for which their members only can compete, but they ought also to guarantee classes, and perhaps give a donation towards the expenses of the show.

[Illustration:

MRS. CLINTON LOCKE AND HER SIAMESE KITTENS “CALIF” AND “BANGKOK.”]

There have been quite a number of catty cases in our courts of late years, and these generally seem to cause considerable amusement to the legal as well as to the public mind. At a recent trial, where a lady was wrongfully accused of starving a Persian cat, the magistrate, wishing for information, inquired of the witness (who was a veterinary surgeon) how long a cat could live without food. The reply was, “I am sure I could not say, sir, for cats are the funniest animals we have to deal with.” And it is very true that these creatures, being so complex, require to be specially studied, and our principal veterinaries, who lead busy lives, are just a little superior to the many ailments and infirmities of these too often despised animals. It is therefore a subject of satisfaction for cat fanciers that two clever and kind animal loving men have taken up the doctoring of cats, and by personal experience are learning “pretty pussy’s ways” in sickness and in health. Mr. Ward, of Manchester, and “Salvo,” of Hertford Heath, are now two household names in the cat fancier’s vocabulary. To the many excellent remedies prepared by these clever specialists I shall refer later on in my work. Suffice it here to say that when in doubt or difficulty about your pussy’s state of health I would recommend you to write to either of these common-sense practitioners.

The cat literature of the present day has been steadily on the increase. The first paper to supply special cat columns was _Fur and Feather_, which, as its title infers, treats besides of birds, rabbits, poultry, cavies, mice. This weekly paper has a large circulation amongst the various fanciers. In 1899 _Our Cats_ was started, and is widely read by the ever-growing circle of cat lovers, and claims the unique distinction of being “The only newspaper in the world solely devoted to cats.” In both these papers there are stud advertisements of cats and a register of visits of queens and births of kittens.

In America the chief organs in the cat world are _The Cat Journal_, _The Pet Stock News_, and _Field and Fancy_.

And now a few words on those most excellent institutions which should appeal to the hearts of the animal loving public—I mean the homes for poor stray and starving cats. It is a mercy that there are now several of these refuges in our great metropolis. I have personally visited Gordon Cottage at Argyle Road, Hammersmith, and the London Institution in Camden Town. The objects of both these institutions are practically the same, namely:—

(1) To receive and collect homeless and diseased cats and painlessly destroy them.

(2) To provide a temporary home for lost cats.

(3) To board cats at a moderate weekly charge.

[Illustration:

THE CATS’ PLAYGROUND: ROYAL LONDON INSTITUTION FOR STARVING CATS AT CAMDEN TOWN.

(_Photo: Cassell & Company, Limited._)]

The Camden Town Institution to which Her Majesty the Queen has graciously given Her Patronage, was founded by Mrs. Morgan in 1896, and up to the end of 1901 has received the enormous number of 47,212 lost and starving cats. The average received weekly is 300, and in one day as many as 91 cats have been taken in. Not a day passes without several wretched cats having to be destroyed at once on admission, and 80 per cent. are destroyed within twenty-four hours of admittance. No charge is made to the poor, and only 1s. 6d. for a painless death in the lethal chamber is asked from those who can afford this most merciful mode of destroying life. The dead cats are cremated at the Battersea Dogs' Home at a charge of 3d. each body. A motorcar is employed to go round and collect stray cats, and will call at any house if due notice has been given to the hon. manageress. It is estimated that the number of cats in London is close upon three quarters of a million, of which from 80,000 to 100,000 are homeless. It is during the summer months, when householders leave town for their holidays, that poor pussy is forsaken and forgotten, and no provision being made for her, she is forced to take to the streets, where she seeks in vain to stalk the wily London sparrow or pick up any scraps from the gutter. The humbler folk very frequently manifest vastly greater solicitude for the Tom or the Tabby of their hearths than do their social superiors. All lovers of cats owe a debt of gratitude to those truly noble ladies who have begun and carry on such a merciful work in our midst. To attempt to alleviate suffering must appeal to all; and even those who have an instinctive dislike to harmless cats cannot fail to see the immense benefit to be derived by the public at large from the noble endeavour to clear our London streets, squares, parks, and empty houses of these poor forlorn and friendless creatures.

[Illustration:

ROYAL LONDON INSTITUTION FOR LOST AND STARVING CATS.

(_Photo: Cassell & Company, Limited._)]

At the Battersea Home for Lost Dogs there are also splendid arrangements for stray cats, and at a very small charge per week cats can be taken in to board. The catteries are capitally arranged, and the feeding is excellent.

In our sister isle there is a Cats' Home, established sixteen years ago by Miss Swifte in Dublin, and she has most gallantly carried out the beneficent objects with which she started her humane work. No doubt she and other founders of similar institutions have had to suffer a considerable amount of ridicule, for with many human beings the cat is regarded as little deserving of commiseration or kindness. It is, however, a sign of increased justice and benevolence that these homes for cats do exist and obtain public support, although the funds received are, according to all accounts, very inadequate to meet all the expenses. This must surely be partly because these splendid institutions are so little known to the general public.

Our American cousins are not behindhand in their laudable endeavours to cope with the question of lost and starving cats, and an institution similar to our Battersea Home was started in the early 'eighties in the district of Boston, and is called the "Ellen M. Gifford Sheltering Home for Animals." The lady giving her name to this humane institution left a large sum of money to endow the home, and over the office is a tablet bearing the following extract from one of Miss Gifford's letters about the time the home was opened:—

"If only the waifs, the strays, the sick, the abused would be sure to get entrance to the home, and anybody could feel at liberty to bring in a starved or ill-treated animal and have it cared for without pay, my object would be attained. March 27, 1884."

According to Miss Helen Winslow, the authoress of "Concerning Cats," there is another institution in Philadelphia which does not limit its good work to tending cats and dogs, but cares for all living and suffering animals, bringing relief to the unfortunate creatures by means of a painless death.

It was as early as 1874 that this institution was founded, and in 1889 it was reorganised and incorporated as the "Morris Refuge for Homeless and Suffering Animals," having for its motto "The Lord is good to all, and His tender mercies are over all His works."

[Illustration:

THE CART OF THE ROYAL LONDON INSTITUTION FOR LOST AND STARVING CATS.

(_Photo: Cassell & Company, Limited._)]

The efforts of the charitable ladies who so ably assisted in the establishment of these institutions have been followed by others, and a proposal to found a home for animals in Montreal has, I believe, proved successful. Miss Winslow tells us that there are several

cat asylums and refuges in the Far West, and a Sheltering Home at Brighton, Mass. In 1901 a Cat Refuge was started in Chicago by a well-known cat lover, Mrs. Leland Norton, and probably, as time goes on, some further organised attempt will be made to deal with the question of lost and starving cats in American towns.

The love of the cat still lingers in Egypt, and I have been told that free rations to starving cats are dealt out every day at the Palace of the Cadi and the Bazàr of Khan Kheleel; also that a cats' home has been founded in Cairo for the lodging and feeding of homeless cats.

[Illustration:

THE HON. PHILIP WODEHOUSE'S "SILVER SAINT."

(_Photo: Clarke & Co., Norwich._)]

There was a report that in order to cope with the innumerable lost and starving cats the American Legislature had decided to enforce a bill for licensing cats, but if such a law came into existence in any country the result would surely be that thousands of cats with good homes would be thrust out into the streets, and that rats and mice would multiply to an alarming extent. It is estimated that in New York city alone 60,000 cats depend for their daily food on garbage and the mice and rats that they capture. Therefore, if each cat catches three mice or rats a week, the sum total amounts to over 9,000,000 a year!

I have often wondered why some of our numerous "distressed ladies" do not set up private homes for the care of cats. A really comfortable country home for cats is an enterprise in which many a woman, who is hopelessly at sea for some means of earning an honest livelihood in this overcrowded work-a-day world, might thus combine pleasure with profit. Many fanciers feel the difficulty and well-nigh impossibility of leaving their catteries for any length of time, and few have a permanent and responsible caretaker on the premises. An opening, therefore, presents itself not only for boarding homes for cats, but for temporary helps who could be engaged by the week or month to take charge of the cattery during the absence of the owner. Of course, such a person should have had experience with cats and kittens, and above all should be an animal lover. To dwellers in any of our large cities the sojourn in some country place would come as a boon and a blessing, and if the owner of the cattery is fully assured of the capabilities of the caretaker, then all anxiety of mind as to the welfare of the pets would be allayed.

There is a secluded corner in Hyde Park known as the Dog's Cemetery, and amongst the many headstones I noticed two or three erected in memory of lost pussies who have been privileged to rest in this quiet burying ground.

[Illustration:

A BEVY OF BLUES BELONGING TO MISS SAVERY.

(_Photo: Waschenki, St. Leonards-on-Sea._)]

When we see poor pussies packed into dirty cages in the shops of dealers of beasts and birds in our great metropolis, and when we are made sad by the sight of the wretched starving cats of our streets, we can breathe no better wish for them than a speedy deliverance from their life of misery, even if it be to embark with the grim ferryman in their free transportation to the Feline Elysium.

"There shall the worthies of the whiskered race, Elysian mice o'er floors of sapphire chace, 'Midst beds of aromatic marum stray, Or raptur'd rove beside the milky way."

A French writer of the early part of the eighteenth century, a famous Jesuit Father, suggests a very strange theory on the old idea as to the nature of the soul of animals. I am sure that the question of a future existence for those pets who during so short a time in this world have been our faithful and loving companions must have often entered into the hearts and minds of true animal lovers.

A wise and good man—a writer of some of our most beautiful hymns, and who passed to his rest within the last year—wrote and gave me these lines when he lost his faithful dog:—

SANCHO: AN OLD FRIEND.

A large brown Irish retriever: buried in the Vicarage Garden of St. Paul's, Haggerston: a stone to his memory is on the school wall, with this inscription:—

"In the centre of this lawn lies

SANCHO,

a gentleman in all but humanity; thoroughbred, single in mind, true of heart; for seventeen years the faithful and affectionate friend of his master, who loved him, and now for him ‘faintly trusts the larger Hope’ contained, it may be, in Romans viii. 19–21.

He died April 26, 1883.”

NOT sparse of friends the world has been to me By grace of GOD; sweetness and light to life Their love has given; many a stormy strife, Many a pulseless torpor, on my sea, Through them—their presence or their memory— Have been or stilled or quickened; and to thee, My Dog, the tribute, as the term, is due, My _Friend_! not least of all dear, near, and true These seventeen years—and through the years to be Sure in my heart of immortality. Must this be all? I’ the great Day of the LORD, Shall aught that is of good and beauty now Be missing? Shall not each gift be restored? Paul says “the whole creation”—why not thou?

CHAPTER III. CARE AND MANAGEMENT.

In the care, management, and feeding of cats no hard-and-fast rule can be laid down, for the dispositions and constitutions of these animals differ just as much as do those of human beings. Fanciers must therefore learn to treat their cats individually and not collectively; they must study their character and make allowances for the fads and fancies of the feline race. I am convinced that a varied diet is the best for cats, and fanciers should bear in mind the importance of regularity in the hours of feeding, whether two or three or four times a day. Fresh water should always be supplied, and unfinished food should not be left standing about. For one or two pet cats the scraps from the table given with judgment will probably suffice; but in the case of a large cattery with several inmates, some sort of system in feeding is necessary. I would suggest that the chief meal for two days a week should be fish, mixed perhaps with rice or Freeman’s Scientific Food, raw meat twice or three times a week cut up into fairly small pieces, horse-flesh (if obtained from a reliable source) twice a week. Lights, liver, or sardines may be given occasionally. Sloppy food in any large quantity should be avoided; but oatmeal well boiled, cornflour, arrowroot, and several of the well-known foods, such as Neave’s or Mellin’s, make a nice change. Spratt’s biscuits of various kinds, soaked and mixed with stock, are relished by some cats. Vegetables should be given frequently, and grass supplied, as green food purifies the blood and keeps the bowels in good condition. Persian cats require special attention as regards their coats, and should be combed and brushed regularly, and, if the fur becomes matted, the knots should be cut away. Avoid washing your cats; there are other means of cleansing their coats, particulars of which will be given in the chapter on exhibiting.

BLUE PERSIAN.

PRESENTED BY MISS PATTERSON TO HER MAJESTY THE QUEEN.]

FEMALE CATS AND KITTENS.

As regards the management of female cats, it is necessary to start from the time when they first arrive at maturity, viz. when they are first capable of becoming mothers. This usually takes place—or they “come in season,” as it is called—after they are seven or eight months old; and though cases have been known when this has happened before six months, it is very unusual. It may therefore be laid down as a rule that if a kitten exhibits extraordinary high spirits, racing and tearing about, it should be carefully watched, and not allowed its freedom without supervision, either out of doors or in the house.

Queens may be known to be in season by several symptoms, such as rolling on the ground, rubbing up against furniture, increased affection for their owners, and often by the curious cries they utter, at times by a soft note of invitation, at other times by shouts of impatience or distress which resound through the house. Cats should not be mated until they are nine or ten months old at least; twelve months is a better age, though if they are insistent it will not do to put them off more than three times, as there are records of cats who, having been kept back on account of extreme youth, have been seriously ill or have never had families at all.

On the other hand, it is possible these cats may have had the reproductive instinct abnormally strong, though for some cause or another they would always have been unfertile. Powders are sold to quiet cats who are considered too young to become mothers, and two or three small doses of bromide have a decidedly calming effect. This drug should, however, be given with caution, as it is a dangerous one in unskilled hands. Cats come in season about every three weeks during the spring and summer; but in the autumn and early winter months nature seems to intend that they should rest; therefore, as soon as the year has turned, and in very mild winters even before Christmas, no time should be lost in selecting the best sires for the various breeding queens, and arrangements made with their respective owners, so that as soon as ever a queen is ready she may be mated without delay, as some cats go off in two or three days, while others are not safe for a fortnight. If possible, it is well to select a stud cat near at hand, especially if your queen is timid and frightened, as a long railway journey may upset her.

It is most essential that female cats should be freed from worms before being allowed to mate or breed, otherwise the kittens will probably fall victims to these pests by sucking in the disease with the mother's milk. Most cat fanciers know the symptoms which are suggestive of worms; and whenever there is a reasonable suspicion of their presence, then it is best at once to resort to some of the many remedies to be obtained from veterinaries and cat specialists.

A cat's period of gestation is nine weeks, but this is often extended to a day or two longer, so that it is best to expect a litter about nine weeks from the date of the queen's return from visiting the stud cat. An experienced breeder will most likely see symptoms of a cat coming in season, and will then do well to give a worm powder. Salvo's No. 3 powder may be given one morning, and the cat sent off the next day quite safely. Visiting queens should be despatched as early in the morning as possible and insured, to save delay on the road, with the owner's name and address inside package, also the name of the cat, as poor pussie will be far happier if on her arrival she hears herself called by her pet name. Full instructions should be sent as to the return journey; also it should be stated if the cat is kept out of doors or indoors, and what food she is accustomed to have, number of meals per diem, etc. If going a very long journey the queen should not be nailed into a box, or padlocked, as occasional delays occur, and the railway authorities will feed and look after an insured cat if packed in a hamper or box where they can get at the occupant. Boxes or hampers with skeleton lids are by far the best on this account. If the weather is very cold and a basket is used, it should be lined, and round the sides brown paper is an additional safeguard against draughts, for which all stations are proverbial. A very delicate cat or young kitten finds great comfort in winter from a hot-water bottle placed inside the hamper for it to rest against. Queens should have a good meal an hour or two before starting, as they often arrive upset with the journey, and in their strange new home will not at first touch any food. Do not put any food in the travelling basket. It is not well for a queen to mate just after a heavy meal.

Fish and warm milk, if these agree with the queen, or a small meat meal, may be offered after a long, cold journey, and, if eaten, the queen should be allowed to rest an hour or two before introducing her to the stud cat.

[Illustration:

THREE LITTLE MAIDS.

(_Photo: E. Landor, Ealing._)]

After mating, a queen should be kept quiet for a few days on her return home, as much apart from other cats as possible; but no uneasiness need be felt if the visit does not seem to have quieted the queen, as she will settle down in a few days and cease to think about her mate. With regard to treatment of cats in kitten, some queens are gentle and quiet, and very careful of themselves, others are exceedingly bad-tempered, fighting and quarrelling, while some amuse themselves by climbing up high places and jumping down, behaving in such a wild and excitable fashion that they not only endanger their own lives, but run the risk of bringing maimed and deformed offspring into the world. Cats such as these should be kept isolated, if possible, or at most with only one other quiet queen, and all high shelves or tall articles of furniture should be removed. It is always well to be very careful in handling cats in kitten. They must never be lifted up by their fore legs, but when absolutely necessary to move or carry them, both hands should be used to do so, one being placed under the body by the shoulders to carry the weight, while the other hand gently supports the hind quarters; but the less a cat is lifted about the better. All medicines should be given quietly and quickly, so that

there may be no struggling. The cat's head should be grasped firmly with the left hand, the fingers and thumb on each side of the corners of the mouth, and forced back on the shoulders with a firm pressure; this will cause her to open her mouth, when medicine can be popped quickly down the throat from a spoon held in the right hand. In the case of a very restless cat, it is advisable to have an assistant in administering medicine. Amateurs would do well to practise giving water in a spoon to queens who are in health, so that they may become used to this simple method of administering medicine. Cats in kit require three or four meals daily of nourishing food—raw meat from four to six ounces night and morning, and fish and scraps and vegetables or biscuit, etc., for the midday meal. Half a teaspoonful of cod-liver oil on their food two or three times a week is very good for the queens in cold weather; but if sickness ensues, of course the oil must be discontinued. _Never suffer diarrhœa to go on unchecked._ This applies to all cats and kittens of whatever age, sex, or condition, but is especially dangerous when a cat is in kit or nursing her young. Mr. Ward and Salvo prepare powders which will stop the diarrhœa, and if persevered with will restore the bowels to their normal condition. Change of diet is also very helpful. If the diarrhœa is very violent or persistent, or if no medicine can be procured, a small quantity of powdered chalk, as much as will lie on a sixpence, may be given every hour or two, three or four times; but the primary cause, of which diarrhœa is only a symptom, should be sought out, and if not discoverable, the advice of a cat doctor should be obtained.

[Illustration:

A PERILOUS PERCH.

(_Photo: C. Reid, Wishaw._)]

Persistent diarrhœa (if not the accompaniment of diseases, such as inflammation of the bowels, etc.), is usually caused by indigestion or worms, and sometimes by a stoppage of fur or food imperfectly digested, which nature in this way tries to get rid of; and if this is the case, or there is even reason to suspect it may be, a dose or two of warm salad oil, a teaspoonful every two hours, will often bring away the obstruction. Cats in kitten frequently suffer from constipation, for which also warm salad oil is far better than castor-oil, as the latter is irritative to the bowels, and though acting as an aperient, the after effects are increased costiveness. Warm salad oil, given a few hours before the birth of kittens, is helpful to the mother. For at least a week before the kittens are expected, a nice cosy bed should be prepared in some retired spot; and, to a novice, the caution would not be amiss—do not let a cat in kitten sleep on your bed, or she will either have her kittens there, or will drag the poor little things into the bed the first chance she gets. If a box is to be made ready for the cat, it should be of a fair size (about twenty-six inches by eighteen inches), and should be placed on its side, and a bit of wood about three inches deep nailed on to the bottom of the side, standing up to keep the bedding in its place and the kittens from rolling out. This box may be placed on a table or two chairs, so arranged that the cat can step in and out from another chair.

The floor of the box should be covered with several thicknesses of flannel or blanket in the winter and paper in the summer. Avoid coloured materials, as the dye will come out if they get wet. A bolster may be placed at one side of the box stuffed with straw, or hay or paper torn up very small, to support the cat's back; but should the weather be very cold and the mother delicate, a hot-water bottle covered with flannel may be used instead, and is a great comfort. A covering should be thrown over the box, which may be pulled down to hide the interior, as cats love to be screened from observation; and also it is very essential that the tiny babies should be kept almost in the dark for the first fortnight, after which time, when their eyes are open, the covering can be raised in the day and lowered at night in cold weather. This box must be placed on the ground as soon as the kittens can walk about, but retaining the ledge already referred to, which will keep them from ground draughts to a great extent. A nice little box with run attached is the best house for a cat and kittens; but as these cost about 25s. each, a number of them become costly and beyond the means of some breeders. The bed described is the next best thing, far better for shy queens than a box or basket used in the ordinary way. An empty drawer makes a good place, but the kittens should be moved out of it as soon as they can see, as it is rather too dark and close after the blind period is past.

[Illustration:

MRS. HARDY'S NEUTER "PHARAOH."

(_Photo: Schutk's Photographic Galleries._)]

A cat should sleep in whatever bed is arranged for her for at least a week before the kittens are expected, and when that day arrives the queen should be carefully watched, as some cats will have their kittens anywhere if not looked after. For the sake of those new to the fancy, it may be as well to remark that cats become very restless, walking about sometimes purring loudly, and

looking in cupboards and dark corners, while occasionally the first noticeable indication that the event is about to come off is that the fur behind is wet, and if this should be the case no time should be lost in carrying the cat most carefully to her bed, as the kittens may then be expected any moment. Some animals like to be left entirely alone while giving birth to their young; others, especially pets, prefer to have their owners near to them; but if there is any uncertainty it is better to leave her to herself.

Experienced breeders will know that should the labour be dry or very prolonged it is a great help to a cat to pass the hand firmly and slowly down the side during an expulsive pain, as the pressure will help the mother and hasten the birth of the kittens.

After the first is born, the rest come comparatively easily. Very occasionally there is a cross presentation; but as only those really competent should attempt to do anything in this case, no time should be lost in sending for the nearest cat doctor or veterinary. After the first kitten has arrived—the birth of which is usually heralded by a loud cry of pain from the mother—some milk should be made hot, and as soon as the new baby has been cleaned the mother will gladly drink this; but on no account should cold or even lukewarm milk be given the same day, or, indeed, for two or three days. Novices are sometimes startled at seeing the cat eating a lump of something which they fear may be a kitten; but there is no occasion for alarm, as it is merely the afterbirth, the consumption of which is probably Nature's provision for affording sustenance to the mother, as an animal in a wild state could get no food for at least several hours after the birth of its offspring. If a cat is wild or shy, it is better to leave her alone (with the exception of offering hot milk from time to time) until all the kittens are born, and they should not be examined or handled for some days.

With a gentle queen the first kitten may be taken away when the second is born, well wrapped up in warm flannel and put by the fire, and so on, always leaving one kitten until the last is warm and dry, when the others should be returned to the mother. This plan is most necessary in cold weather (especially if the kittens are born out of doors), for if the labour is easy and quick it is quite impossible for the queen to dry one kitten before the advent of the next, and by the time they are all born they are frequently stone cold, and so wet that the mother gives up the attempt to dry them in despair; and many kittens, thought to be stillborn, have died in the night in this way. Kittens quite cold and nearly dead have been restored (and have lived to a good old age) by being taken at once to the fire and warmed and dried, and though at first life may appear extinct, time and patience will work wonders. If the kittens are taken away from the mother at birth as described above, it is a good opportunity for destroying any that are not wanted, because of sex or colour. When the litter is given to the mother she should be offered milk again, and should after that be left alone several hours; but she will most likely welcome a few kind words and loving pats as a reward for all she has gone through, and will then cuddle down contentedly with her little ones.

In giving milk do not take the mother out, or even make her get up to drink it, on the day of her confinement; if she cannot reach it comfortably, raise her head and shoulders with one hand, until she can reach the saucer held in the other conveniently, and do not be in a hurry, as she knows well the temperature the milk ought to be, and will not take it if too hot or too cold. Milk should be given night and morning, and offered during the day, for some days after the kittens are born. Cats that never like it at other times are thankful for it when nursing; but, on the other hand, cats that have been fond of milk will turn away from it at these times. Queens usually come out every few hours for food, and their meat or ordinary meal should be ready for them, as they will want to eat it quickly and return to their little ones. After the second or third day a warm, clean blanket should be substituted for the one on which the kittens were born, and it is well to do this when the mother is present, as some cats resent interference during their absence.

As soon as the kittens are about a week old, a finger should be passed over their eyes, and if there is a little ridge on the lids, the eye should be moistened with eye-lotion twice daily with a camel-hair brush. If, after ten days, they do not open as is usual, the eyes should be sponged with warm water, as in this case they must have become glued together with mucus, which should be cleared away, and the eye moistened with eye-lotion, taking care a little goes well into the eye. The lid should then be smeared with olive oil to prevent adhesion. It is this adhesion of the lids which causes inflammation, and the eyes must be frequently attended to, so that they may be kept open, avoiding any very strong light.

If the kittens are born indoors in the summer, windows should be kept open during the day, and when the little creatures are about a fortnight old put them out in the sunshine for an hour or so daily. The mother must be as well fed as she was before the kittens were born, but carefully notice if she suffers from diarrhœa, for if this is the case, and change of diet does not cure it, you may be certain that she is nursing too many kittens, and if some of them are not speedily removed you will lose them all.

If a foster mother can be procured, by all means have one, accompanied by one of her own kittens if possible. Make a cosy bed for her, warming the blanket, and leave her in it till night, when, if she seems settled down, give her two or more kittens as the case may be, removing her own the following night. Do not attempt to interfere with the kittens while the mother is away, and act very

gently, talking to, and stroking her so that she may not resent your interference. If no foster-mother can be procured, Mr. Ward, of Manchester, has a clever little appliance which he claims can be used instead of a foster-mother.

[Illustration:

“THE RAIDERS” CAUGHT!

(_Photo: E. Landor, Ealing._)]

Some fanciers may take upon themselves the task of bringing up the kittens by hand, and in that case wrap them up in warm flannel, keeping them by the fire by day, and giving them a hot bottle at night, feeding with weak milk and water about every two hours (this should be about half and half), with a teaspoonful of lime-water to each cup of milk and water. It should be given warm, not hot, and the milk scalded, not boiled. In London or large towns unsweetened condensed milk is better than cow’s milk, as the colouring or preservative acids used by dairymen in the latter is very injurious to kittens. This condensed milk should be much diluted, and flavoured with small quantities of salt and sugar. If too strong or too sweet, the food will cause diarrhœa. Kittens will soon learn to suck out of an eggspoon; but do not give too much at once, or force the food down their little throats when they object to take any more.

At about five weeks old the kittens will begin to lap and possibly to eat. Many fanciers are delighted if they will eat and drink before a month old, and some make the serious mistake of trying to coax the little ones to eat solid food at this tender age. Such persons do not stop to think how weak are all the digestive organs of these tiny creatures. The milk of the mother supplies all that is needful for their growth and well-being until such time as Nature makes itself heard in her demands for further nourishment, and if substantial food is given to them too soon, or too strong, it merely goes through the stomach, passing out into the bowels undigested, decomposes, and forms slimy mucus which is the hotbed for worms, even if it does not set up inflammation of the bowels. More kittens die from worms and consumption of the bowels than from any other complaint, and much of this loss of life is directly traceable to strong food at too tender an age.

Lung disease, gastric catarrh, gastro-enteritis, are all directly or indirectly set up by the non-assimilation of food; hence the supreme importance of giving nourishment which can be digested easily. After six weeks scraped raw beef may be given (if the kittens want to eat) three times daily in very small quantities, about half a teaspoonful to start with, and they may have warm milk and water with lime in it. This should be followed by Mellin’s, or Benger’s Frame Food, as directed for infants. It is advisable not to allow kittens to overload their stomachs, but to feed them about four times daily. If healthy they will eat eagerly, but not ravenously; a kitten who is greedy and precipitates itself into the saucer in its anxiety to get its dinner may be suspected of worms, and when about eight weeks old a course of Salvo’s No. 1 powders may be given with safety.

As soon as the kittens are about a month old, a shallow tin of dry earth or ashes (I do not recommend sawdust) should be provided for them, and it will well repay their owners to spend some portion of the day with the little ones and lift them into the earth pan when necessary. If this is done two or three times, the lesson is probably learnt for life. Kittens are naturally clean, and will get out of their beds, and run about crying loudly for some accommodation for their wants; and if this is neglected the seeds of dirty habits are sown, and the poor untaught little ones reap a sad harvest of cuffs and sometimes kicks from servants, who naturally dislike the trouble caused by dirty house pets. Even in catteries cleanly habits in cats are much to be desired. If a cat or kitten gets into dirty ways, it should never be beaten and put into the tin, but should be gently stroked and coaxed into good habits. Those who only keep one or two queens will find that if they spend a few minutes playing with the kittens before their meals, they will be well rewarded by the quicker growth and better digestion of the little ones; but, of course, this is out of the question in a large cattery.

In summer, kittens should be combed daily with a small tooth tomb, as the insects which inhabit their coats not only worry them and cause them to scratch out their fur, but they convey disease from one to another, to say nothing of sucking out so much blood that the poor little creatures become absolutely anæmic, and in this state they fall an easy prey to the first disease that attacks them. Fleas were formerly treated as irritating but otherwise harmless insects; but we are assured on the best authority that they are a dangerous medium of disease, and that tapeworms are generated in dogs and cats by their means. The poor animals, wildly resenting the annoyance of these pests, hunt for them with teeth and tongue, and, swallowing their enemy, may also swallow a number of undeveloped tapeworms, which in their larval or grub state are secreted in the abdomen of the flea. Tapeworms are said to undergo certain metamorphoses or transformations, and require to pass through the body of some other creature than the one they exist in in their mature state of being.

[Illustration:

KITTENS BELONGING TO MISS BROMLEY.]

It is a great mistake to keep kittens in heated rooms, and worse still to allow them to be close to a fire by day and then to let the room get cold at night. An even temperature, cold and dry, is better than sudden changes; cats and kittens love warmth and comfort, but, at the same time, all extremes of heat and cold are bad. Never neglect the first symptoms of illness; note the signs, and if you are not able to dose the invalid yourself send off a wire to some competent cat doctor describing the form the indisposition has taken, and while waiting for medicine no harm can be done by giving as much carbonate of soda as will lie on a threepenny-bit in a little water two or three times daily. Salvo has lately advertised a medicine which is said to be very valuable for giving on the first signs of a cat or kitten being out of sorts, and which, he says, will take down fever, stop colds, and modify attacks of bronchitis, pneumonia, etc.; and for such fragile little beings as kittens fanciers would do well to keep this medicine by them. People often say that their cats and kittens seem ill or out of sorts, and allow this sort of thing to go on quite calmly for a week or so, when one day they wake up to the fact that the poor creature is very seriously ill, and they then send off in a hurry for medicine which frequently arrives too late; and the sufferer may be beyond all human aid.

Double pneumonia, which is perhaps the quickest and most fatal of all diseases, is not so sudden but that it is ushered in by various symptoms, beginning often a week before the attack becomes acute. An animal will seem cold, will creep near the fire, or sit in the fender, mope about, refusing to play, sit in a hunch with its back up, or is very sleepy and stupid; the fur is rough; there may be sickness, and the evacuations are of a bright yellow colour; perhaps it has not quite finished its meals for a few days; and the nose is hot and dry, and, if taken up, the cat feels hot and dry all over. When there are several of these symptoms, no time should be lost in administering the remedies named above every hour or two until suitable remedies can be obtained; but do not rely upon them alone, or think if you give them persistently they will pull the animal through the illness, for they will not, special remedies being needed for special symptoms and for various stages of disease. No two animals are exactly alike, and the experienced cat doctor will prescribe carefully for each individual cat in the same way as a physician will give different prescriptions to suit the needs of different patients.

One thing should _never_ be neglected, and this is keeping up the strength from the first with beef-tea, eggs and milk, Brand’s Essence, or animal Kreochyle— a teaspoonful every hour. As soon as an animal has refused two meals, begin feeding with spoon, as it will have so much more strength with which to battle against disease if fed up well from the first.

People who desire to sell kittens for profit will do well to part with them at about two months old, before they start teething, for at this period of their little lives fresh troubles begin. Occasionally they suffer from fits, but though these are sometimes caused by cutting their teeth, they are oftener due to the presence of worms. If the gums are swollen and inflamed, a quarter of one of Steedman’s teething powders will soothe them, or a few doses of bromide, as prescribed before for kittens desiring to mate too early, may be given, and excitable kittens should be kept quiet. If kittens are troubled with diarrhœa, all starchy food should be avoided, as it is never easily digested by animals. The reason of this is not far to seek, when we know that the saliva partly digests starch, while the juices of the stomach act directly on meat.

[Illustration:

NEUTER PETS OWNED BY MRS. HASTINGS LEES.

(_Photo: The Royal Central Photo Co., Bournemouth._)]

Animals, instead of masticating their food, by which means the saliva acts upon it, often bolt it, and it goes into the stomach and is passed out into the large bowel practically undigested, where it decomposes, working off in noxious gases which escape through the skin, causing eczema, or in many cases producing inflammation of the bowels or enteritis. Nothing needs more careful attention than the diet of kittens, and nothing is so little studied. It would be no exaggeration to say that all disease, apart from outside or accidental causes, such as draughts, cold winds, contagion, etc., is in the first place set up by undigested food, and even what may be called external causes would often not be harmful to an animal if the digestive organs were in proper working order. Remember, it is not the quantity of food a kitten takes that benefits it. The secret of its health and well-being is in the quantity it digests. A kitten should only digest certain things in certain proportions, and whatever remains undigested produces irritation, and in this case the kitten cannot possibly develop, and is generally weakly and fretful.

Those who have never cared much for cats will be interested and amused if they bring up a family of kittens, and the love and trust of the little creatures will well repay them for all their care.

STUD CATS.

A male cat should not be allowed to mate under a year old, and if you wish to keep your stud in good condition do not allow more than two, or at most three, lady visitors a week. There is no doubt that a really reliable stud cat is a very profitable possession. The most essential recommendations are a sound constitution and absolute health, combined with a good pedigree and a list of prize-winning progeny. It is necessary to exhibit your stud cat at the best cat shows from time to time, and thus to keep him before the public. It is also advisable to advertise him in the cat papers, and it is often useful to have a photograph to forward to fanciers who may be unable otherwise to obtain any idea of your cat. Needless to say that for stud purposes a cat should possess the highest possible qualifications of the breed to which he belongs, and a massive frame and broad head are most desirable in all stud cats. It is a good plan to allow the visiting queen to be within sight of the male for a short time before she is put in the stud cat's house, and for this purpose it is convenient to have a small movable pen or hutch to place where the two pussies can hold catty conversation.

A stud cat cannot, for many and obvious reasons, be allowed his full freedom; but it is essential that his dwelling place should have as long and roomy an exercise ground as possible. It is also possible with some male cats to tether them out of doors for a short period during the day, in which case great care should be taken to have the lead only as long as will permit of exercise within a safe distance of dangerous pitfalls or spreading trees and shrubs. The best time for mating is about one hour after feeding.

It is most important that stud cats should be in good coat at the time of mating, and that they should be free from worms.

The usual fee for a visit to a stud cat is £1 1s., and this should be sent at the same time as the request for permission to send a queen. A second visit is generally considered allowable if the first one has proved unsuccessful. An additional amount of food may be given to a cat whilst he is being used at stud, and always remember to provide grass in some form or other in your stud cat's house.

There is no universal remedy for all cats, neither can there be any rule for feeding them. Different cats need different treatment, and those which are kept in a captive state, as are stud cats, should not be fed on the same lines as those that are allowed full liberty.

NEUTER CATS.

Opinions differ as to the best period for a cat to be made neuter, but it is generally considered advisable to have the operation performed between the ages of five and eight months. A male cat can be kept as a household pet till he is about nine or ten months old without any unpleasantness, but after that period he must be relegated to an outside cattery or stud house. It is cruel to put off gelding a cat till he shows signs of wishing to mate. A duly qualified veterinary ought to be employed, and an anæsthetic used. The cat should be kept on a low diet for a day or two before and after the operation. It is very seldom that any evil effects ensue, and after a few days the puss is quite himself again. Neuter cats grow to an immense size, and the Persian varieties develop great length of fur, which is generally not shed so frequently or to such an extent as in the males and females. Neuter cats are very docile, and generally rather lazy and listless; for this reason they are not accounted such good mousers.

Female cats can also be rendered sexless, but in their case the operation is more likely to be attended with dangerous results. I have heard it stated that a female cat ought to be allowed one litter of kittens before being operated upon. There are not many very fine neuters on exhibition at our shows, and this fact may perhaps be accounted for by reason of fanciers picking out weedy and altogether below the mark specimens of their litters to be gelded because they do not consider them worth keeping to breed from. In this way several poor specimens of neuters are to be seen with indifferent markings, white spots, incorrect coloured eyes, and long noses. For a home pet there is, of course, nothing to come up to a fine neuter cat who will not roam, who does not attract amorous females, and who is content to lie for hours stretched out on the drawing-room rug or the kitchen hearth, the admired of all admirers. From the lips of many noted breeders of Persian cats who have been troubled by wandering males and prolific females, I have heard the exclamation, "I shall end by keeping only neuters!"

Cat owners in general, and lovers of neuters in particular, might do worse than agitate for more consideration to be extended to these grand pets at our leading shows, and I cannot help thinking that a neuter club or society might be formed to assist in this and other objects connected with the general improvement of our neuter cats.

CHAPTER IV. HOUSING OF CATS.

The proper housing of valuable stock is the first essential subject to be studied by the beginner in the cat fancy, and one requiring both careful thought and attention. For I do not hesitate to say that, of all the domestic animals, the cat is the most difficult to keep healthy and happy in the unnatural condition of total or partial confinement. Belonging to the feræ, its original and savage nature still shows glimpses, not wholly tamed, in its independence of character and its roving habits; while yet its civilised side shows the keenest appreciation of the comforts to be found in the home life. A house cat that enjoys its freedom to go out as it pleases, to climb the garden walls, and anon to lie in purring contentment before the kitchen hearth, is a creature ailing little. It is the pedigreed pets, in their luxurious prisons, that too often fall a prey to disease. To establish a cattery, therefore, that shall be a pleasure and a pride to the owner, and not a source of worry and grief over perpetual illness amongst the inmates, it is necessary in the very first inception to study the chief needs of cat nature.

Let us consider these in order. How our typical healthy cattery may be best arranged. It must be dry—was ever a cat yet seen of choice sitting in the wet? It must have ample space, both of houses and runs, and inducements for exercise—a well-branched dead tree sunk in the gravelled run is good, besides divers posts, shelves, and benches. Let the aspect be bright, with lots of sunshine. A cat is a devotee of the sun—it is the life of young growing things, and the greatest destroyer of disease germs; and it is very easy by coverings or the growth of climbing plants to provide temporary shade during the height of summer. For this last, nothing is better than that most useful and least fastidious king of climbers, the Virginian creeper, as it bestows its leafy shade just when required, and harbours no damp, as the growth of thick, tall trees is apt to do.

[Illustration:

A MUSICAL PARTY.

(_Photo: E. Landor, Ealing._)]

Lastly, let the outlook of the cattery be cheerful. Do not select a spot so far from the house life that the attendant who feeds and cleans is practically the only person the cats see in the twenty-four hours. A cat loves to observe, preferably from some secure high perch, whence it may see all that passes—to exchange greetings with the dogs, the gardener, the maids, the tradesmen coming to the door, and thus fill its imprisoned hours with interest. If you disregard this, and put your cats out of sight in some back yard, they will mope badly, and also grow very stupid.

These principal requirements being borne in mind, individual fancy of building and arrangement may follow. Every breeder of experience has his own ideas of best design, according to means and circumstance. If a cat fancier is fortunate enough to be able to disregard expense, he can indulge in brick houses with every appliance for comfort and elegance of construction. For others, who can supply a working plan, an intelligent local carpenter (when found) can do much. Occasionally, also, it is possible to convert a portion of existing stabling to very efficient uses. But I must advise the beginner, as regards this last suggestion, to be careful. If the stabling is modern, and possesses the main requisites I have already spoken about (of dryness, and space, and cheerful light), then all is, and will be, well. But if, as is often the case, the stable of temptation is old, perhaps unused for some years, is dark, with more than a suspicion of damp, and a very certain habitat of rats, then our fancier is emphatically warned against making any trial of it, short of pulling down and rebuilding. Let him rest assured, it would in the end mean the loss of money, time, care, and, most likely, breeding stock too, and certain ill-health among the poor inmates. I know a case in point where a cat fancier thus utilised a stable. A converted portion of old stabling that looked most desirable, and kept scrupulously clean, was used for a number of young kittens. Very soon a peculiar and most violent form of skin disease appeared amongst them, at first as mere scurfy patches, but

swiftly assuming the form of contagious fever, which spread with frightful rapidity, infecting every cat with whom they came in contact. Not until after many deaths, and the most cruel sufferings of those who struggled through the disease, was it at last discovered to be acute blood poisoning, produced by the exhalation of sewer gas from an old sewer running underneath the floors. Rats were probably responsible, either by gnawing through the pipes, or coming up into the cattery, themselves stricken with the foul disease.

The site of the cattery selected, the preparation of the ground may be advisable, certainly on all clay soils. To ensure perfect dryness, the top soil should be removed a foot or so and filled in with brick rubble or builders' rubbish. On this foundation, cement concrete or asphalt may be laid down. Personally, for runs and floors, I prefer the cement; it is easier to keep clean—a bucket of water can swill it from end to end, while it dries much faster than the asphalt. Asphalt in outside runs is apt to soften in the summer sun, and depress into holes, and within the houses the smell of the tar remains strong for some months. The cost of the two is much about the same, but in very damp situations the asphalt is preferable, as it prevents all ground-damp rising through.

Now to plan out a medium-size cattery that shall be simple in construction and not ruinous to the modest beginner, let us suppose we have at our disposal a fair length of brick wall—say 60 to 70 feet in length—facing south, on slightly sloping ground. Our first proceeding will be to level and render damp-proof by a foot of rubble, as heretofore suggested, a strip 11 feet wide and about 45 feet along the wall, and to surface this strip with cement or asphalt. Upon this, and against the wall, we will erect our houses, a long wooden shed with lean-to roof, divided into three main divisions by matchboarding partitions, and with a smaller house at either end, as shown in plan.

A, the sleeping-room; B, a playroom for queens and kittens; and C, the third apartment for kittening, or cats it is desirable to isolate awhile. The smaller houses at the outside ends reserved for stud cats. D, doors from one apartment to another of wood. The outside woodwork is of 1-inch feather-edged matchboarding, well-seasoned deal, a roof of wood, felted and tarred, being preferable to the use of corrugated iron, which is very hot in summer and very cold in winter; an annual dressing of sand and tar keeps the felt watertight for many years. Allow good wide eaves, and have gutter pipes all round. Inside, line the walls with wall felt, and limewash; or an inner lining of 1-inch matchboarding, allowing a two-inch space to be packed with sawdust, keeps the house very warm and dry.

For the brick back wall, ¼-inch matchboarding should be sufficient as lining. The dimensions of the sleeping-room, A, are 12 feet long by 11 feet wide, and a wire frame partition with door subdivides this again into two equal parts. Against the back wall, at a height of about 20 inches from the floor, runs a broad shelf 4 feet wide, having inch mesh wire netting frontage, half to open on hinges, and movable wooden partitions sliding in a slot; these for the sleeping-pens, each 4 feet deep by 3 feet wide, two on either side the wire frame partition, or convertible into one 4 feet by 6 by removal of sliding wooden division. It will be warmer for the occupants if these pens are roofed in at a height of 3 feet. Cover the bench with oilcloth before putting up the divisions. This can be washed over daily if necessary, and will dry in a few moments, thus avoiding the dangers of scrubbing wood in damp weather. As nothing offensive can soak in, a pure atmosphere is preserved, and risk of infection is greatly minimised.

A comfortable sleeping box or basket should be provided for each pen, filled in winter with plenty of sweet hay, and in summer with sheets of newspaper or brown paper. A cat loves to repose on paper, and it has the advantage of being cheaply renewable and easily burnt after a day or two's use. Never use old packing straw for bedding. It is frequently full of infectious germs, and many skin complaints have been traced to its use. Neither are cushions, blankets, old bits of carpet, matting, etc., to be recommended. They are apt to become damp in prolonged wet weather, and retain both dirt and odour. A sanitary tin to hold dry earth or sawdust should be placed in each cat house, emptied and washed out every morning by the attendant, when the floors are also swept out or washed over.

A fair-sized window, to open, must be in the front, and a door, the upper half of which might also be of glass, to open out into a gravel run. Outside wooden shutters for cold nights are a great help in keeping the house warm, and should be provided.

Having arranged our first room, the playing room, B, next must come under consideration. This being the central division, the felt lining could here be dispensed with, and instead the boards can either be plainly stained and varnished—which is also easy to keep perfectly clean—or Willesden damp-proof paper might be nailed over the walls. This paper, made at the Willesden Company's works, Willesden Junction, N.W., is made in several good colours for interior lining, and a house so hung looks very comfortable, and shows to advantage such mural decorations as show prize cards, photos of winners, etc. The frontage of this room is to be entirely glazed, in small panes set in a wooden framework, with a 6-inch high weather board at floor to protect from draughts, the

glass protected on the inside by wire netting fastened over it. A window here to open outwards with a bolt, and fairly high up, to ensure fresh air in rainy weather without the wet and damp driving in on a level with the cats; a half-glass door also to run, but no outside shutters will be here needed, the cats not occupying this room at night. Cover the asphalt floor with linoleum or oilcloth, and put up some shelves 15 inches wide, fairly high up, but within leaping distance, against the walls; a movable bench too, to place the cats upon for brushing and attending to them. Old chairs that can be spared from the house might end their service here; or if the luxury of a plain wicker chair could be permitted, and furnished with one or two cushions in washable slip covers, it would be as pleasant for the owner when making her visits as for the pussies themselves. A ball for the kittens, a reel hanging from a string, will stimulate healthy romps, even amongst the staid grown-up cats, when weary of indoor dozing.

Room C. C is primarily intended for the interesting occasions when new little prize-winners are expected. This is subdivided by wire as in sleeping-room, but the partition three feet from back wall should be of wood, to ensure privacy to the anxious mother, and to temper the light; oilcloth on floor.

For the littering nests themselves I describe, and advise my friends to make trial of, the following plan. Have a sort of shallow wooden box, or tray with sides, made about 4 feet 6 inches long by 24 inches high and 4 inch sides. This is stained, varnished, and mounted on wooden feet at the four corners about two inches high; a good bed of hay is put in it, the box is put in a quiet corner away from the light, and a truss of new straw placed upright at one end of the box, leaning against the angle of the wall. A little of the straw at the bottom may be pulled out to suggest the idea of a hole to the cat; but as a rule she takes to the notion brilliantly, and will set to work to dig out a nest for herself with the greatest zest. In this the kittens are born, safe in a cosy nest at the end of a tunnel of straw. There is ample ventilation; they are protected from all draughts, so that doors may be left open to the fresh air with impunity; and they are in the dark, as kittens naturally should be till they walk out into the daylight of their own desire to explore the world. Then the rest of the tray forms a glorious playground for the first week or two, when one adventurous mite finds out he can climb up the shallow sides, and tumble out on a large strange world of floor and trot after mamma. A well-known fancier tells me she has not had one litter with weak or bad eyes since she adopted the straw truss plan.

[Illustration:

THE IDEAL CATTERY.]

One of these trays might be placed each side of the wooden partition, and if necessary to shut a nervous or surly cat up with her family, one might be enclosed in a wire frontage with door, as the sleeping-pens were arranged. Let there be a good large window in this room, as the kittens, when running about, will want all the sunshine and air possible. This run should be of asphalt, for dryness and warmth, with plenty of play places arranged in it. An old barrel with the bottom knocked out affords great games, also the tree I have before spoken of; a tree-stump or two, or a heap of dry brushwood stacked in a corner, will supply those climbing and hiding holes kittens so greatly enjoy, and afford protection from winds.

A grass run and a gravelled one are designed in the plan, each having access to the other, and will allow the cats ample exercising ground according to weather. An oval flower-bed in the centre of the grass plot, planted with some evergreen bushes, is a good idea. It affords shelter, and the cats can dig in the dry earth. For the benches in the gravel run, an old outhouse door, painted and mounted on stout legs, makes a very good one, which the cats love to sit upon.

The stud houses are simple: a wired-in space of 12 feet by 11 feet contains a house with lean-to roof 4 feet by 8 feet long, fitted with sleeping bench and box, wired windows, door for attendant, and small trapdoor for cat. _En passant_, all doors should be fitted with good locks, and locked up after feeding at night is done. The stud run is gravelled, but a border of grass might be left on two sides—grass is such a necessity for cats in confinement, and they prefer to select it growing for themselves. The design here suggested is capable of either modification or extension. The plan can be enlarged to any extent. For instance, if desired, an attendant’s cottage could be built at one end instead of the stud house, and comprise a special kitchen, and also an upper room, fitted with convenient pens for a hospital for the sick members—a very necessary adjunct to the cattery, as a sick cat should be at once removed from its healthy companions and kept in a place quite apart. More stud houses could be arranged at an angle on one side of the chief runs, or, if only a very few cats are intended to be kept, one of the divisions could be dispensed with, perhaps, and the dimensions of the other two made smaller. But whatever your ambitions may be, great or small, when you are about it have the work well done.

The heating of catteries is a rather vexed question, many famous breeders affirming that stock raised without it are healthier and harder; others maintaining that a certain amount of heat is a necessity for producing a good coat. A very experienced breeder once

told me the heaviest-coated kittens she ever bred were reared over some hot-water pipes, in a temperature of 70°! With adult cats having partial freedom and allowed to come into the house in severe weather, and with stud cats, I consider the no-heat plan decidedly the best; but I do not think it possible to rear young stock during the colder part of the year in an outdoor cattery without artificial heat. It is the damp of the English winter which proves so fatal, and damp cannot be kept out of the very best constructed houses except by the admission of dry heat.

Kittens that are cold will not play, and if you see them huddled together on a cold day looking listless and uneasy, instead of romping, be sure it is fire heat they need.

A thermometer should hang in each house, and the heat be carefully regulated by that, a minimum of 48° and a maximum of 55° being suggested. In houses where a flue is practicable, a stove of the Tortoise pattern is to be recommended, but it needs a high guard around it. For a long range of brick-built houses, an outside flue and boiler, with hot-water pipes running the length of the cattery, would be found of most service, as it maintains an even and medium warmth throughout, keeps the building perfectly dry, and can be stoked with less trouble. In small wooden houses, very excellent results are given by the use of an oil stove with hot-water apparatus, such as are supplied for small greenhouses. The lamp will usually burn twenty-four hours without attention, is un-get-at-able by the cats, who can neither singe their tails nor knock it over during the wildest gambols, and if kept clean and looked to with care will not cause the slightest odour. A quart of paraffin in one of these oil stoves will burn twenty-four hours, and heat a building 12 feet by 10 feet to 50°. Now, in concluding this little discourse upon catteries, the final word of advice is always to remember the importance of _absolute cleanliness_. There should never be the least offensive smell in the cattery, and if such be noticed on entering the houses in the morning, discover the cause and remedy it at once. And do not rely solely upon disinfectants to do this. Too frequently this is but overcoming a bad smell by a stronger, the evil remaining. A good and non-injurious disinfectant should always be used in the water for the daily cleansing of pans and floors, etc. Camphaleyne or Salubrene are both safe and effective, but disinfectants that contain creosote in any quantity, or carbolic, I do not approve of, except in cases of illness of an infectious type, when stronger measures are obligatory.

No dirty food dishes, no unchanged water, no soil of any kind, should ever be left about on flooring or bedding. Let your cattery be kept as scrupulously clean and sweet as a hospital, then will your cats thrive and kittens be healthy and sturdy.

[Illustration:

A LITTER BOX.]

Do not elect to start a cattery unless you yourself intend to bestow both time and trouble upon it. In this, as in every other occupation or hobby, the one golden rule is, “Whatsoever thy hand findeth to do, do it with all thy might.”

APPLIANCES.

In the preceding section on the cattery proper, I have not spoken of the very useful variety of portable houses which are now made a speciality of many firms, considering them more or less as accessories to the well-appointed cattery. But in small town gardens, where space is valuable and it is not convenient to build a large permanent structure, it is quite possible to succeed extremely well when two or three cats only are kept by using these portable houses. They also have the advantage of being removable and a “tenant’s fixture” in the event of leaving one’s house.

[Illustration:

A USEFUL CAT HOUSE.]

A very good house is one built by Messrs. Boulton and Paul, of Norwich (_see_ illustration). It is a very pretty and well designed structure, and would be exceedingly ornamental in a sheltered corner of the garden. In putting up, however, it should be stood upon brick piers to raise it at least four inches from the ground, or the wooden flooring would soon show damp. Cats kept in these small houses, it must be understood, should have their liberty at least a portion of every fine and dry day, the runs being wholly inadequate for a cat to be shut in continuously without further scope for exercise.

Another illustration is a handy portable hutch, intended to be used chiefly in a house or room, although it is also convenient for penning young kittens out of doors on a sunny day, the wire run preventing their straying away. It consists of a sleeping box and small wire run hooked on, and can be made at the cost of a few shillings.

[Illustration:

A PORTABLE HUTCH.]

The sleeping box is 24 inches long by 17 inches wide and 22 inches high, is raised three inches from floor by a false bottom, and has a large door at back opening with a brass catch. In front, two side-pieces reduce the entry to 12 inches. A handle screwed on the top of the box is convenient for carrying. The run is 3 feet 6 inches by 24 inches, made in four sections, two sides, top and end piece, all fitted and hooked together with 1-inch mesh wire netting that it may be easily taken apart for carrying or storing away. It makes a useful sleeping-pen, too, for young toms that are inclined to quarrel together, and so have to be shut up separately at night. All the woodwork is stained and varnished, and a square of oilcloth laid on the floor of the sleeping box.

The next appliance to be considered is a somewhat gruesome adjunct to the cattery, and belongs to the darker side of our hobby. In spite of every care, illness and death must enter now and again, when we are fain to retire worsted from the conflict with disease, and the wisest and kindest thing to do is to put our pet to sleep. The illustration given on the opposite page depicts a lethal box, as used at the Royal London Institution for Lost and Starving Cats at Camden Town, and is capable of holding twelve animals at a time.

Mr. Ward, the well-known feline specialist of Manchester, has patented a lethal box of more moderate dimensions. Mr. Ward, not yet having an illustration of it, kindly writes me the description as follows:—“The box inside is 15 inches by 12 inches by 12 inches. A sheet of glass is inserted in the lid, so that the operator may watch the process. The vapour—coal gas passed through chloroform—enters through a tube at end. Two minutes is sufficient time.”

Fanciers, I think, will agree that this simple peace-giving box is not among the least of Mr. Ward’s kindly ministrations to the cats he loves so well. Few amongst us can bear to see unmoved the terrible last pains of a pet who in its days of health delighted us with its beauty.

Feeding utensils we turn to next. For them nothing is more satisfactory than the unbreakable enamelled ware in white or blue—except, perhaps, for the water pans, for which it is scarcely weighty enough, and it not infrequently happens that a gay and frolicsome company of kittens will knock against them, sending them spinning, and the water is spilt upon the floor.

The circular, heavy glazed earthenware dishes, spittoon-shaped, and generally inscribed “Pussy,” are excellent, and cannot be overturned.

Besides the plates and saucers for feeding, let the cats have also a saucepan of their own, a deep stewpan-shaped one of blue enamel, large enough to cook a sheep’s head with biscuits. Cook will be far less prone to grumble at the necessary cooking for the cats—I speak here of a small cattery, when no attendant is kept—if her saucepans are not pressed into the service.

But see that all are kept scrupulously clean, nothing “left over” in the saucepan to become sour or tainted in hot weather; and after each meal is cooked, the saucepan should be boiled out with soda and scoured clean.

Earth tins. A great mistake made in these necessary items is having them too deep. I have seen an old zinc footbath supplied to two months old kittens with quite six inches of sawdust in it, and the owner wondered why she could not teach her kittens to be cleanly in their habits!

A 4 inch deep tray is quite deep enough, and this should not be filled more than two thirds full, or the cat rakes so much earth out on the floor. Neither do they require to be very large, as their weight when filled with soil makes them very cumbersome to move, and they get the more quickly knocked out of shape. The best size is about 17 inches by 14 inches and 4 inches deep, made in stout galvanised iron, with a rim round the edge, and these might be painted some light colour with Aspinall’s enamel paint. (I advocate “light paint” as any dirt stains are seen at once.) They will then last free from rust, and can be washed out every morning. Two or three tins of smaller size—say, 12 inches by 8 inches by 21 inches—are suggested for kittens, or for placing in small pens in an emergency. Baking tins answer this purpose.

After washing, it is well to stand these trays in the air to sweeten, as if they smell disagreeable the cats will not use them.

[Illustration:

LETHAL CHAMBER, ROYAL LONDON INSTITUTION AND HOME FOR LOST AND STARVING CATS.

(_Photo: Cassell & Company, Limited._)]

Messrs. Whiteley supply these zinc tins, or they can be made by any local ironmonger to dimensions given.

Hot-water appliances. These are very necessary in the cattery, and should by no means be forgotten.

Many a sick cat's life has been saved, and the critical corner in an illness turned, by the timely comfort and strength bestowed by the hot-water bottle or bag, or even a brick made hot in the oven and wrapped up. In the event of winter litters, too, a hot-water bag should be always in readiness, in case it is advisable to remove the first-born kittens from the mother for a few hours. Heat will restore a seemingly dead kitten, as I have said before. The outside dwellers also, how they appreciate on a bitter winter's night the hot bottle or wrapped up hot brick to keep them cosy!

I know a luxurious stud cat who has a hot-water tin made to fit his sleeping box, which is filled by the maid every cold night and slid beneath his hay bed. Assuredly, there is no greater safeguard against winter's chills and changes of temperature than to provide for your pets sleeping warmly and comfortably at night. The hot-bottle plan has many advantages over the heating of the sleeping houses by stove or lamp during the night. It is better for the animals themselves, as the air is not exhausted, and they are not so prone to take a chill going from heated air to the outside rawness of a winter's morning. It is much safer, and it is also much more economical.

[Illustration:

SPRATT'S TRAVELLING BASKET.]

Personally I prefer the indiarubber bag to the old-fashioned stone bottle, and in the smaller sizes (which are quite large enough) are not much more expensive than the latter. If not filled too full, and wrapped in a washable cover—flannelette is very good—it can be laid flat under the hay, and the cat will remain upon it all night. In the case of a sick cat the cover should always be of flannel, to avoid any chill as the bag grows colder.

Then, in our list of appliances, proper travelling baskets must come under consideration. I say "proper" advisedly, for how heterogeneous is the collection of hampers, boxes, baskets—I had almost added bundles—one sees brought in by the officials during the receiving hours before a big show! Every variety of package, very many of which are exactly what they ought not to be. Some unnecessarily elaborate, polished wooden cases with brass fittings—handsome and durable no doubt, but far too cumbersome, and by their very weight inflicting much jar on the occupant when moved about; while others are a disgrace to anyone pretending to care about a cat or even to know what a cat is, many deserving to be straightway brought under the notice of the Society for the Prevention of Cruelty to Animals.

I have seen big heavy cats jammed into margarine hampers, a thin wicker receptacle whose sides slope inwards like a flower-pot, where the animal must have suffered agonies of cramp in a veritable chamber of "little ease." Others are sent weary distances in shallow, rough grocery boxes with a few holes bored for ventilation, subject to be thrown about in transit, first on one side then on the other, the lid perchance nailed on, giving thereby much extra trouble to the penning officials. Little wonder if the cat arrives bruised, shaken, frightened nearly to death, and very probably wild and savage.

Now, as evil is wrought by want of thought (and common sense) as well as want of heart, I have thought it well to comment on these very wrong and stupid ways of sending our cats on their journeys before advising better arrangements.

Here are two illustrations of excellent travelling baskets, which fulfil pretty nearly all requirements for cats travelling singly.

The first is made by Messrs. Spratt, and has an inner skeleton lid, which is much to be recommended when sending a vicious or very timid cat that is likely to make a bolt on the basket being opened.

The second, beehive shaped, is designed by Mrs. Paul Hardy, of Chobham. It is of strong white wicker, the lid fastening with a rim of about two inches deep over the body of the basket, apertures in the rim allowing the wicker loops of the fastenings to project; when the cane stick is thrust through these the basket is absolutely secure—not a paw can get out.

[Illustration:

A USEFUL CAT BASKET.]

[Illustration:

“A GANG OF POACHERS”—KITTENS BELONGING TO MISS ALICE DELL.

(_Photo: E. Landor, Ealing._)]

This beehive shape has several advantages. The cat can stand up and stretch itself at ease, when tired of lying down. The handle being at the apex, it is carried—even by porters—without the cat being tilted off its legs; whilst the dome top prevents any other package being piled upon it—a disadvantage the flat-typed hamper always has. I line my baskets outside with brown paper or oil baize up to the rim, and inside with curtain serge, leaving the lid free for ventilation. Then, with plenty of hay at the bottom of the basket, the cat will travel from one end of England to the other in comfort and safety, with no danger of taking cold even if left about draughty platforms or in parcel offices. This basket is made by Messrs. Bull, of Guildford, at a very moderate cost, and lasts for years.

These baskets are, of course, intended for one cat only, or a pair of kittens. A really safe and capable travelling arrangement for a litter with the mother has yet, I think, to be devised. I have seen none I think good. The double compartment hamper I much dislike. The handles are perforce at each end, necessitating two carriers—who never do it—so the hamper is dragged by the porter or official with one end tilted (the other cat being nearly upside down), is leant up against other luggage, or dropped flat with a bang. With young kittens inside this leads to fatalities.

A label for the travelling basket seems an insignificant item to mention, but an efficient one is as important as that proverbial nail for whose absence the horse and the kingdom were lost.

I have just made the acquaintance of a first-rate label, devised and sent out by a Mr. Foalstone, at sixpence per dozen, from the Aerefair Engineering Works, near Ruabon. It is a stout linen label, printed “Valuable Live Cat” in big block letters; below is “Urgent” in red—a good idea, red being more likely to attract the casual eye of the railway official. Spaces are left below for line of travel, _viâ_, etc., and date and time of despatch. It is reversible, so the sender can fill up with the return address if necessary. I always prefer to fasten the label down at both ends, flat to the basket: it is less likely to be torn away than when left hanging loose from one eyelet.

It is by due attention to the details that cat fanciers can to some extent mitigate the dangers and risks that must necessarily attend the transit of live stock by rail.

[Illustration:

WAKING BEAUTIES.

(_Photo: Mrs. S. F. Clarke._)]

CHAPTER V. EXHIBITING.

Amongst cat fanciers there is a laudable ambition not only to breed good stock but to exhibit it. Certainly there is vastly more gratification and satisfaction in obtaining high honours for cats and kittens that we have bred ourselves, rather than for those specimens which money has purchased.

If we consider that our cats have sufficiently good points to merit their being entered for a show, we must bear in mind that all the beauty and form and feature will be thrown away unless our pussies are in good show condition. For exhibition purposes condition means everything, and this is more especially the case with the long-haired breeds. A first-class specimen whose coat is ragged and matted cannot fail to suffer in the judges’ estimation when compared with another cat, of inferior quality perhaps as regards points, but yet in the pink of condition, with its coat well groomed, its eye bright, its fur soft and silky. In the present day many of the specimens penned are so close together in point of breed merit that a very little turns the scale one way or the other. I have often said to myself, when judging a class of cats, “This exhibit would be a winner but for its condition,” and I have had to put it down in the list. There is no doubt that with long-haired cats a fine full coat will cover a multitude of sins, but it cannot alter a long nose or poor shape and bad-coloured eye; and in urging the importance of condition, I at the same time deprecate the awarding of prizes to cats that have nothing to recommend them but their pelage. Seeing, therefore, that a handsome specimen may go to the wall for the lack of attention on the part of the owner, it behoves all cat fanciers and would-be exhibitors to do everything in their power to make their cats look their very best, so that their pets may be things of beauty in the show pen. In the dog, rabbit, and pigeon fancy a great deal more attention is given to condition than amongst cat fanciers, who need waking up to the fact that nothing goes so far

to propitiate a judge as superb show form and general good appearance. There may be standards of points for the guidance of the awards, but assuredly a common-sense judge will look with disfavour on a specimen with excellence of breed and correct colour of eye if his coat is draggled and matted, his tail dirty, and his fur soiled. We have only to run our minds back to the various exhibits of well-known fanciers at our large shows, and we shall find that the most persistently successful exhibitors have been those who have sent their cats to the shows in the best condition. Some fanciers, wishing to help on entries at a show, will exhibit their Persian cats when quite out of coat. This is a mistake; send your entry money if you like to the secretary, but keep your coatless cats at home. As regards the short-haired breeds, these cats should have coats with a gloss and brilliancy like that of a well-groomed horse, shining like satin; a spiky appearance in the fur denotes poor condition in both long and short breeds.

In getting cats ready for exhibition owners should look to their comforts in every way. Their houses and beds should be kept clean, their coats combed and brushed daily. Attention should be paid to their ears, for if these are neglected a cat will continually scratch them, and thus injure its appearance by tearing out its fur. Some fanciers are in favour of washing their cats, but when we take into consideration the usually delicate constitutions of Persian cats, and the restless, impatient nature of these animals, it behoves us to try to find some other effectual means of cleansing their coats, which in the case of white and silver cats are naturally easily soiled. Experience has taught me that very good results can be obtained by damping the coats with a soft cloth dipped in a weak solution of ammonia and water. Follow this up by rubbing some white powder into the fur and well fingering the parts that are at all greasy. Pears' white precipitated fuller's earth is the best preparation, and is perfectly harmless. To clean away the powder use a fairly soft brush, and after this process has been gone through several times your cat will be fit for show. Another method of cleaning long-haired cats is to heat a quantity of bran in the oven. Put it into a large bowl or footbath, and stand the puss in it. Rub the hot bran well amongst the fur for some minutes, and afterwards carefully brush it out. This treatment will give a soft and silky appearance to the coat, but for light-coloured cats the powder is more cleansing.

Cats require to be educated to the show pen, and it is very necessary in some cases to give a course of training. For this purpose it is well to obtain a similar pen to those used at shows, and to place your puss in this for an hour or two daily. In time he will learn to come and sit and look out of his temporary prison, and when he makes his _début_ he will not spoil his chances by crouching at the back of the show pen, or vex his would-be admirers, who may have recourse to the use of an umbrella or stick to make the exhibit move into a more convenient and conspicuous position.

Taking it for granted you have decided to send your cat to a show, the first step is to register it in the club under whose rules the show is to be held. At present the National Cat Club and the Cat Club both require separate registration, the charge being one shilling. It is, however, to be hoped that the earnest wish of all cat fanciers and exhibitors will ere long be fulfilled, and that one register will be kept by an independent person, so that pedigrees can be verified and mistakes rectified, and the confusion caused by a double registration will cease to worry and perplex the cat-loving community. Registration forms are supplied by the secretaries of the respective clubs, and you must fill in the particulars of your cats as set forth on the forms, a sample of which is here given, together with the registration rules of the National Cat Club:—

REGISTRATION.

The registration rules of the National Cat Club are as follow:—

1. Every Cat exhibited at a show under National Cat Club Rules must (except such as are exhibited exclusively in Local Classes, or exhibited in Classes exclusively for litters of kittens), previous to the time of entry for such show, have been entered in a registry kept by the National Cat Club at their offices. A charge of 1s. each shall be made for registration. In such registry shall be inserted the name and breed of the cat, and its breeder's name, the date of birth, names of sire and dam, and of grand-sires and grand-dams, and if the dam was served by two or more cats their several names must be stated. If the age, pedigree, or breeder's name be not known the cat must be registered as breeder, age or pedigree "_unknown_," any or all, as the case may be. If the name of a cat be changed, or an old name re-assumed, such cat must be again registered and identified before exhibition in its altered name.

2. A name which has been duly registered in accordance with Rule 1 cannot be again accepted for registration of a cat of the same breed, without the addition of a distinguishing number, prefix, or affix, for a period of five years, calculated from the first day of the year next after the one in which the name was last registered; but the name of a cat after publication in _"Our Cats" and the Stud Book_, or which has become eligible for free entry therein, cannot again be assumed.

N.B.—The name of a cat that has become eligible for free entry in the _Stud Book_ in any year shall not be changed after the 31st of December of that year.

Cats do not receive a number on registration. Numbers are only assigned to Prize Winners or cats entered in the Stud Book on its publication, on payment of a fee of Five Shillings, in addition to One Shilling for registration.

The application for registration must be made on a form as follows:—

NUMBER OF BREED AS PER LIST IN MARGIN____COLOUR____

I wish to register the following __ (_Sex_) by the name of____

Previously registered by the name of_____

_Signature of Owner_____ (Mr., Mrs. or Miss)

_Address_____

LATE OWNER (if any)_____

SIRE_____ } G. SIRE_____ } OWNER OF SIRE___ } G. DAM_____

DAM_____ } G. SIRE_____ } OWNER OF DAM____ } G. DAM_____

DATE OF BIRTH_____

NAME & ADDRESS OF BREEDER_____

_____

NOTE.—If this name cannot be registered, I select one of the following, and name them in the order named: (1) _____ (2) _____ (3) _____

Only one cat must be entered on one form, which must be forwarded with a remittance of one shilling to Mrs. A. Stennard Robinson, Hon. Sec., at 5, Great James Street, Bedford Row, London, W.C.

The various varieties as recognised by the Club are as follow:—

SHORT-HAIRED CATS.

1. SIAMESE.

2. BLUE.

3. MANX.

4. FOREIGN.

5. TABBY.

6. SPOTTED.

7. BICOLOUR.

8. TRICOLOUR.

9. TORTOISESHELL.

10. BLACK.

11. WHITE.

12. SABLE.

13. TICKS.

14. ABYSSINIAN.

LONG-HAIRED CATS.

15. BLACK.

16. WHITE.

17. BLUE.

18. ORANGE.

19. CREAM.

20. SABLE.

21. SMOKE.

22. TABBY.

23. SPOTTED.

24. CHINCHILLA.

25. TORTOISESHELL.

26. BICOLOUR.

27. TRICOLOUR.

It will be seen that you are requested to give more than one name, and it is very desirable in the first instance to select an uncommon one, which may be considered your cat's exhibition title, but you will doubtless have some short pet name for home use. A prefix, probably the name of the town or village in which you live, can be used to specially identify your cat. For this an extra charge is made. It is well to fill in the pedigree as far as possible, and every exhibitor should strive to obtain correct particulars of date of birth and name of breeder of the cat to be exhibited. It is a pity to label your cat "unknown," if with a small amount of trouble exact details can be obtained. At any rate, it is important to state the names of the two parents. The age of kittens should be counted by months—that is, say, from the 20th to the 20th. Having registered your cat, you receive a notification of such registration, and whether you are intending to exhibit or not it is very necessary and advisable that your cat should be duly registered in at least one of the parent clubs.

A separate fee is charged for each cat or kitten in each class, and the amount must be forwarded at the same time as the entry is made. The following is a copy of the entry form used at the Cat Club's Show at Brighton in 1901, and I may mention that the fee for registration has since been raised from 6d. to 1s.:—

+----------+----------+ | _ENTRIES CLOSE MONDAY, NOVEMBER 4TH, 1901._ | Class as per Schedule. | | | | | BRIGHTON CHAMPIONSHIP SHOW OF THE CAT CLUB, | No. | | TO BE HELD AT | | | MELLISON'S HALL, WEST STREET, BRIGHTON, | | | ON WEDNESDAY AND THURSDAY, NOVEMBER 13TH AND 14TH, 1901, | | | Under the Exhibition Rules of The Cat Club. | | +----------+----------+ | RULE AS TO REGISTRATION OF NAMES OF CATS AND KITTENS. | Also Entered in Classes | | | numbered as per | | Every Cat or Kitten exhibited at a Show under The Cat | Schedule. | | Club Exhibition Rules MUST be Registered at the Cat Club.| | | Fee 6d. | Nos. | | | | | Every Cat or Kitten which may have changed ownership | | | since Registration MUST, before Exhibition, be | | | Transferred to its new owner in the books of The Cat +----------+ | Club. Fee One Shilling. | Please not to write in | | | this space | | To change the name of a Cat or Kitten, when allowable, | | | the fee is One Shilling. | | | | | | _See The Cat Club Exhibition Rules, Nos. 1 to 6,_ | | | _in the Schedule._ | | +----------+----------+ | CERTIFICATE OF ENTRY. | Kindly fill in the | | | amount enclosed for | | I hereby Certify that the Cat or Kitten to be exhibited | for Fees, &c., as | | by me as below is _bona fide_ my property, and I enter it| under:-- | | at my own risk, subject to the Exhibition Rules of The | | | Cat Club, and the Regulations of this Exhibition as | | £ | s.| d.| | arranged by the Committee. | Cheque | | | | | | | | | Has this Cat been Registered at The Cat Club | Post Office | | | | | (_see note above_) ---- | Order | | | | | | | | | | Has this Cat been Transferred (_if purchased_) to | Postal | | | | | yourself as owner in the books of The Cat Club | Order | | | | | (_see note above_) ---- | | | | | | Cash | | | | | Name of

Water will be provided | | | otherwise. | | | | | | ONE FORM IS SUFFICIENT FOR ONE CAT OR KITTEN IN ANY | | | NUMBER OF CLASSES. | | +----------+----------+ | No Entries will be accepted without Fees. | | Postage Stamps taken Thirteen to the Shilling. | | | | Exhibitors are particularly requested to write distinctly, and also to be careful | | to name correctly the Class in which they intend to exhibit their Cat or Cats. | | | | All Correspondence and Entries to be addressed to Miss F. SIMPSON, Durdans House, | | St. Margaret's-on-Thames. | +----------+

The exhibiting rules should be carefully studied, and intending exhibitors must pay great attention to the classification set forth the schedule so as to determine the correct class in which to enter their cats. If there remains any doubt in the mind of the novice, then it is best to consult some reliable and well-known breeder, giving a full description of the cat you wish to show.

It is a grievous disappointment if through ignorance or carelessness a good specimen is labelled “Wrong class.”

It is always stated in the schedules that the entries close on a particular date, and that after this none can or will be received. Experience proves, however, that this is often not a law of the Medes and Persians, for the date is frequently of an elastic nature, and therefore it is always worth while for an intending exhibitor to write requesting that, if possible, his entry may be received, although it is forwarded after the advertised time of closing. Many exhibitors are not aware that by paying an extra shilling they can generally secure a double pen for their cats. It is not usual for the secretary of a show to send a receipt for entries and fees, as the tallies and labels which are forwarded later serve as an acknowledgment for these. When by any chance labels, etc., are not received in time to be used by exhibitors, or they are lost or mislaid, then the hampers should be addressed to the secretary of the show, and a note of explanation enclosed. The entry can then be looked up, and the pen number discovered. If cats are entered in joint names, then it is desirable that the owners should let the secretary know to whom to send the labels and tallies, as if these are only forwarded a day or two before the show to the partner who does _not_ keep the cat, complications may arise. If litter classes are provided at a show, it is well for the intending exhibitor to send the whole litter, as the number of the family is taken into consideration in judging, and perhaps a large litter of six may take over a smaller litter of three, even though the quality of the trio is in advance of the larger family. As regards pairs of kittens, I would say select two kittens as near alike as possible in colour, size, and quality; they need not be of the same litter, but it is as a “pair” they will be judged, so if one exhibit is much inferior to its fellow then the value of the pair is seriously diminished. A defective eye or damaged tail will tell against a cat or kitten in the show pen, therefore it is useless to throw away entry fees upon these blemished, though perchance dearly loved, creatures.

[Illustration:

RICHMOND CAT SHOW: ARRANGEMENT OF TENTS.

(_Photo: Cassell & Company, Limited._)]

The question of ribbons to suit the colours of the various cats is one deserving of consideration. Many exhibitors make the mistake of using broad ribbons and making very big bows, but both long and short-haired cats present a neater appearance with narrow ribbons, and the bow should be stitched in the centre, so that it cannot come undone and thus give a dishevelled appearance to the puss. The metal tallies will hang more gracefully round the neck if a slip ring is run through the hole of the tally and then the ribbon is put through the ring. Cushions and hangings for the pens are not at all desirable, even if they are permitted. They collect germs and become offensive, and moreover it is much better that all exhibits should be placed on the same footing—namely, a bed of hay or straw.

If owners are unable to accompany their exhibits to the show, it is more than ever necessary that secure, comfortable, and safe travelling boxes or hampers should be used for the transit of the cats. It is not advisable, nor is it generally allowable, for more than one cat to be sent in a hamper to a show.

The question of hampers and travelling appliances has been dealt with in a previous chapter, but I would earnestly impress upon exhibitors not to send their cats away on journeys, long or short, in tumble-down hampers and unsafe packing cases. Whether

hampers or boxes, I would here suggest that whichever is used let the fasteners be secure and yet easy to manipulate. Straps should be attached to the box or hamper, as in the confusion and hurry of show work these, if left loose, may get mislaid. The labels should be so arranged that they may be conveniently turned over for the return journey, where, on the reverse side, ought to be the owner's name and full address. It is most important that these should be distinctly written. I recommend all exhibitors to insure their cats when sending them to a show. The charge is 3d. for every £1, and having paid our money we take our chance, which is perhaps a less hazardous one than if this precaution had been neglected.

The arrangements, or rather want of arrangements, as regards the transit of live stock on our railways leave much to be desired, and therefore it behoves fanciers and exhibitors who value their cats for their own sakes and for their intrinsic worth, to do all in their power to mitigate the discomforts of a journey and the risks that must necessarily attend the conveyance of live stock by rail. Some fanciers make it a rule never to exhibit unless they themselves can take and bring back their cats, and though this necessarily entails a great deal of trouble and some expense, yet there is an immense satisfaction in feeling our pets are under our own supervision. There is also an advantage in penning your own cats, and if you arm yourself with a brush and comb you are able to give some finishing touches to pussy's toilet previous to the judges' inspection and awards. Let me recommend a metal comb, and a brush such as is used for Yorkshire terriers, which has long penetrating bristles, but is neither too hard nor too soft.

Disqualification of cats or kittens at shows may arise from various causes. First, if the cat has not been registered, or if it can be proved that the animal has not been in the possession of the exhibitor for fourteen days before the show, or if a wrong pedigree has been given, or the date of birth of a kitten is incorrect. Any attempt at "faking" will disqualify an exhibit, and in some cases the too free use of powder on white and silver cats is a disqualification in the eyes of some judges. Exhibitors have been known to dye the chins of tabby cats and treat white spots on self-coloured cats in the same manner. Such "faking," as it is popularly called, is always risky, as well as a most undesirable operation, and if resorted to ought not to be passed over by a judge who might detect the artifice and yet lack the moral courage to expose the offender. Let me warn exhibitors against the evil practice of over feeding their cats at shows. It is so much better for a cat to starve for two days than to overload its stomach with the plentiful supplies brought by an over-anxious exhibitor. The sanitary arrangements at present existing at cat shows do not allow of such a course, and if one meal of raw meat and plenty of fresh water is supplied by the show authorities pussy will fare much better than being stuffed with a variety of dainties brought in paper bags.

[Illustration:

MRS. GREGORY'S "SKELLINGTHORPE PATRICK."

(_Photo: W. J. Smith, Lincoln._)]

Whilst the inmates of your cattery are attending shows it is a good opportunity to give an extra cleansing and airing to their houses, and on their return be careful to destroy the hay or straw contained in the hampers or boxes, and thoroughly disinfect these, leaving them out in the open air for a day or two before packing them away. It is generally advisable to give a slight aperient to grown cats after they come back from a show, for it often happens that these cleanly creatures refuse to make use of the scanty accommodation provided for them in the show pens, and thus complications may arise unless attention is paid to their wants on their return. If many cats are kept, and some are sent to a show, on no account allow these to mix with your other animals on their return. It is a wise precaution to keep them apart for a few days, more especially if you have young kittens to consider.

The prize cards should be returned in the hampers when sent back to exhibitors. If these are soiled or broken on their arrival, a request to the secretary asking for fresh ones will probably be attended to.

Every member of a cat club and exhibitor at a show has a right to lodge a complaint with the secretary and committee of the club under whose rules the show is held, if an injustice has been done to an exhibit in the opinion of the exhibitor. According to the rules a deposit has to be paid, which can be reclaimed unless the complaint is considered "frivolous."

Show promoters cannot afford to give their money away without some return or provisional stipulation, and therefore fanciers must not complain if when a class does not fill it is either amalgamated or only half the advertised prize money is given. This latter plan is by far the more satisfactory. There has probably never been a show of any live stock held where complete satisfaction has been given; but, generally speaking, "grumbling" is a most mistaken and pernicious habit, and exhibitors should strive to become good losers. If they cannot learn this lesson, then the remedy remains in their own hands, and they had better keep their cats at home rather than run the risk of being disappointed themselves and of causing unpleasantness to others. If a judgment is obviously

wrong, then the triumph is with the best cat, and we should take our defeat in a sportsmanlike manner.

[Illustration:

“INQUIRY.”

(_Photo: Mrs. S. F. Clarke._)]

In July, 1902, a cat section in connection with the annual dog show was held in the Old Deer Park, Richmond. This proved a great success, and entries numbered over three hundred. A few words in description of this show may be appropriate here, especially in view of the photographs (specially taken) which illustrate this chapter.

Its chief features were the twenty-five entries in the litter classes and the ring class for neuters only. Objection is often made to litter classes, and yet these are certainly the most attractive. I think that double pens should be provided, and special food ought to be supplied for the little ones. It stands to reason that very young kittens cannot be fed like the grown cats, and it is only natural that if big pieces of meat are thrust into the pen for the mother the hungry little creatures will make a rush for it. They bolt down the hard lumps, and these remain undigested in their tender little stomachs. It is not to be wondered at if gastritis, inflammation, and other distressing ailments supervene. It is much better to let the mother do without her usual meat rations and content herself with good, nourishing baby food, such as Mellin’s or Ridge’s, rather than run the risk of providing her with such which will injure her little kittens. With ordinary supervision no evil consequences should ensue from the introduction of litter classes, especially at a one day show. It is not, however, advisable to have litter classes at shows held during the winter months. But in perfect, warm weather no fatalities will be reported. Certainly the mothers with their families prove a great attraction, and as woollen balls, attached from the top of the pens, are provided for the amusement of the kittens, they delight themselves and their audience with their playful frolics.

The ring class for neuters _only_ was an innovation and proved very successful, and although some of these pet pussies declined to show themselves off to the best advantage, yet they did not “go” for each other as is sometimes the case when the males are within measurable distance of each other. The illustration given is from a photo specially taken for this work, and shows the judges deliberating on the respective merits of the neuter cats. On this occasion a famous Blue Persian owned by Madame Portier carried off the honours. He behaved very well on the lead, and his grand shape and wonderful coat made him an easy first.

Another illustration shows the judges at work awarding the special prizes, which in many cases have to be decided conjointly. Miss Frances Simpson and Mr. C. A. House are comparing notes and determining which of the first prize kittens is deserving of the special for the best in the show. On this occasion Mrs. Bennet, a well-known breeder of Blue Persians, was awarded the coveted prize.

A general view of one of the rows of pens is given, but on this particular occasion no covering was supplied for the benching, and, therefore, the aspect of the show pens leaves much to be desired. The travelling baskets being placed under the pens, these should be hidden from the public gaze in order to give a neat and tidy appearance to the show. The best material for this purpose is red baize. The custom of allowing exhibitors to pen their own cats enables them to give their pussies a final brush up before they are subjected to the critical examination of the judge. Our illustration represents Mrs. Peter Brown, a well-known breeder of Blue Persians, attending to the toilet of her beautiful “Bunch,” who on this occasion repeated her successes at the Botanic Gardens, and carried off the highest honours in the Blue Female Persian class (_see_ page 73). And now to pass on to another portion of our subject.

JUDGING.

A standard of points for all long and short-haired cats was drawn up by a sub-committee of the Cat Club, of which I was a member; but since specialist clubs have come into existence, having each their own list of points, nothing much has been seen or heard of the Cat Club’s standard. It is just as well to have some definite lines upon which fanciers and exhibitors may base their ideas, and so aim at, if they cannot attain to, the height of perfection set forth in these standards. They are really not meant for judges, because I venture to assert that a judge is no judge if he requires anything besides his own personal conviction, experience, and common sense when called upon to decide the various points in the different breeds. A good judge of old china will not search for the mark to know whether the specimen is Chelsea or Worcester. He will tell you “it is marked all over”—that is, he knows a good bit of stuff, even if it should not have the gold anchor of Chelsea or the square mark of Worcester ware. So it is with a good all-round cat. It appeals at once to the eye of the connoisseur, just as a worthless specimen is at once put out of the ranks of winners.

[Illustration:

RICHMOND CAT SHOW: JUDGES AT WORK.

(_Photo: Cassell & Company, Limited._)]

It is the greatest error not to have thorough confidence in oneself when undertaking to judge cats, or, in fact, in judging any animal, or any thing. No one should undertake to judge if they wish to seek the counsel of others. They must have the courage of their _own_ convictions, and, although some amount of training may be required, I think that judges are born, not made; and people who have not a keen power of observation and a faculty of coming rapidly to a fixed conclusion can never hope to become satisfactory or competent judges. There are many cat fanciers on whose judgment of a cat I should implicitly rely, and who know a good specimen when they see it, but if placed before a row of twenty or thirty cats of a breed they seem to lose their heads and get hopelessly confused, and then the reporter says, “We could not follow the awards.” There is no doubt that judges of cats are severely handicapped. Firstly, cats are such terribly timid, shrinking animals that when dragged out of their pens with great difficulty—for the doors are most inconveniently small—they often struggle so violently that, for fear of hurting the animal or of its escaping, the judge will swiftly restore it to its resting place without having obtained much satisfaction from his cursory examination. Unless judging pens are provided, there is really no chance of making fair comparisons between two cats which may appear of almost equal merit. How is a judge to decide on the form of limbs and general build of a cat when holding it in his arms or seeing it huddled up at the back of its pen?

An agitation is now on foot for having cats judged in a ring, and, no doubt, in time this will be the order of the day at our shows; but fanciers will have to train up their cats in the way they should go—namely, when quite young they must be accustomed to a lead and also be constantly brought out amongst strangers. As an example, I would refer to the starting gate recently introduced into this country on the racecourse. It was no use to attempt it for the old stagers, but trainers soon accustomed the two-year-olds to the innovation, and I believe many, if not all, the objectors are now converted to the new system of starting racehorses.

[Illustration:

TYPE OF CAGE AT THE RICHMOND CAT SHOW.

(_Photo: Cassell & Company, Limited._)]

In judging a class, I first go round and mark the absent cats; then I note down those that could not under any circumstances take a prize. If there is a large class—say, of twenty to thirty specimens—I mark off all poor and seedy-looking cats until the number is reduced to about eight or ten; then I begin to search for the winners. At this point I take out each specimen, and, if no judging pen is provided, I get someone to assist me, and by bringing out two cats at a time I can make comparisons and note down any remarks in my book for further reference. It often happens that one particular cat will stand out prominently from all the rest in a class, and then there is no difficulty about the first award. It is always well to give a “reserve” and to distribute—but not too freely—the V.H.C., H.C., and C. cards. It does not do to make these too cheap, and scatter them all over the class. V.H.C. might be awarded to a cat in splendid coat, but which failed in head and eyes; H.C. to another specimen with hardly any coat and poor head, but correct in eye; and C. to a promising youngster without any serious fault, only with no striking point of merit. A good judge must thus weigh the pros and cons and have a reason to give himself or anyone else for each degree of merit, from first prize to the humble C. And here I would mention that there is a nice and a very nasty way for an exhibitor to question a judge’s award. To be attacked suddenly with the query, “Why have you not given my cat a prize?” is quite enough to make a judge retire into his shell and refuse any explanation; but if asked to kindly give a reason why a certain animal has failed to win, and to explain why one specimen, apparently a fine cat, should be lower than another, I am sure any judge would gladly give the inquirer the benefit of his larger experience and the reason for his awards. It is a mistake for a judge to distribute the full complement of prizes in a class when and where the exhibits are not possessing of sufficient merit. A first prize cat should be a good specimen of its kind, and it is much better to withhold this award than to give it to a poor representative of his breed. It also reflects discredit on a judge, for an exhibitor wishing to boast of his honours may publish that his “Tommy Atkins” took first under so-and-so, when perhaps there were only two cats in the class. It is quite legitimate for a judge to ask permission of the show authorities to award an extra prize in a large class with several fine specimens; and if he has withheld others in a poor and badly filled class then there is no extra burden put on to the funds of the club. A great deal should be left to the discretion of the judge, and in the matter of special prizes, if one is offered for, say, the best long-haired white cat, and only one or two specimens are on show, and these are neither of them good types of this breed, then the judge should be empowered to withhold the prize. Such a course may be an unpopular one, but I am sure it is the

correct and fairest one, for it is a farce to award first prize and specials to an inferior animal just because he happens to be without other competitors. Anyone who has judged the large classes of blues and silvers which now appear at our principal shows will bear me out in my suggestion that such classes, numbering perhaps thirty and more exhibits, should be subdivided according to age. Such an arrangement would be welcomed by judge and exhibitor alike. At the Crystal Palace Show in 1901 the blue kittens numbered thirty-nine in the class, male and female, the age limit being three to eight months. How could a judge be expected to satisfactorily award three prizes in such a huge class? And I know that many superb specimens on this occasion had to be content with a V.H.C. card, which it would have gone to my heart as a judge to place on their pen.

MR. T. B. MASON.

(_Photo: C. L. Eastlake, Leeds._)]

If there is a prize offered for the best cat in the show, the judge or judges have not to consider which is their favourite breed or which is the most fashionable colour, but just which cat is the best possible type, which specimen is the nearest perfection, and which is exhibited in the best all-round show condition. In long-haired classes the length and quality of coat and fulness of ruff go a long way towards a high place in the awards, and, as I have before remarked, condition is a most important factor in the judges’ estimation. In the self-coloured classes of blues and blacks a judge should make diligent search for white spots on throat or stomach. Formerly cats thus blemished were relegated to the “any other” class, but it has been wisely decided by both clubs that cats with white spots should be judged in their own classes, and that this defect should count as a point or points against them. This is as it should be, for to place self-coloured cats in an “any other colour” class seems absurd. They are black and blue cats in spite of a few white hairs, and should be judged as such. They may never aspire to a first prize, at any rate at a large show; but surely a really fine black or blue cat, with correct eyes, grand head, and good shape, even with the unfortunate spot, should and ought to score over a poor specimen with green eyes and long nose. In the tabby classes a judge will first consider the ground-work and markings, and to these premier points special attention should be given, as there is a tendency to breed tabby cats which are barred only on heads and legs, the body markings being blurred and indistinct. It is not unlikely that in due time the “any other colour” class will no longer form part of the classification at our large shows. Formerly this used to be the largest class of any, but nowadays the entries are becoming small and beautifully less. It is not worth while for a fancier to keep these specimens—they do not fetch any price, they are not valuable as breeders, and it is quite a toss-up whether they can win in such a mixed company. I remember the time when blues were entered in the “any other colour” class, and when blue tabbies were more numerous than silvers or blues. It is really a most difficult task for a judge to give his awards at a local show where all sorts and conditions of cats are placed in the one class. Such an arrangement is good for neither man nor beast. And then, again, at our large shows it behoves a judge to be very level-headed to cope with the numerous brace, team, and novice classes, for one cat may be entered in all these, besides being in the open cat and kitten class; and woe betide the unfortunate judge who makes a slip, for the wrath of the exhibitor and the sarcasm of the reporter will be poured out upon him. No doubt it is a grave mistake to reverse one’s own awards, and yet judges are but mortal, and “to err is human.” It is hard when cat fanciers take to judging the judges and their judgments. A judge may be absolutely ignorant of the owners of the cats, and thus utterly unbiased; yet there will not be wanting those who will pick holes in their characters, and see in their awards clear proof of personal spite and party favour. The intense suspiciousness of some fanciers and the readiness with which they impute low motives to others is greatly to be deplored.

THE TOILET.

MRS. PETER BROWN AND HER PRIZE CAT.

(_Photo: Cassell & Company, Limited._)]

I will here quote from an article by Mr. C. A. House, the well-known editor and judge of live stock. Under the heading of “The Judging of Cats,” Mr. House says:—“All my awards are based on the idea that each breed possesses a distinctive feature, and that distinctive feature must be the one to which most consideration is given. After the chief features come others, such as shape, coat, colour, etc., and the premier awards should be given to cats possessing the best all-round properties.... Selfs, above all things, should be pure in colour. For instance, a blue should be blue, and a black, black. Yet a little rustiness of colour should not be allowed to outweigh a host of other good properties. Colour, however, is hard to breed rich and pure, and should at all times be more highly valued than size, or even coat. The same with markings. Only those who have tried to breed markings know how difficult it is to get them anything approaching perfection. Nothing is more fleeting than marking, and nothing more tantalising to the breeder. Summing up the matter, my own opinion is, and has been for years, that the cat fancy has been hindered and hampered by judges judging the exhibits because they belong to so-and-so, or had won so-and-so under so-and-so.... I was much amused at one incident at Westminster where a big champion had suffered defeat. The fair owner was heckling the judge, and he in reply to her remarks made this answer: ‘It makes no difference to me had the cat belonged to the Queen herself; I should then have done the same. I don’t judge cats on what they have previously won or because they belong to any particular person. I judge them on their form at the time, and it makes no difference to me if a cat has won fifty firsts or none at all.’ This reply was more than the exhibitor had bargained for, but all honest-minded fanciers must acknowledge the judge was right. What is sadly needed in the cat fancy to-day is more of this sturdy, unflinching determination to judge cats and not their owners. Cat exhibitors have much to learn yet, and the sooner the morale of the judging arena is raised the more healthy will the fancy become and the more quickly will it advance.”

[Illustration:

BLUE PERSIAN KITTENS.

(_Photo: Mrs. S. F. Clarke._)]

Another of our well-known judges, Mr. T. B. Mason, writing on the same subject, says:—“In my judging engagements I have very often come across exhibits with good-coloured eyes, but not the correct shape. A small eye, however good the colour may be, will give the cat a disagreeable, sour expression. With this shape of eye we generally see a narrow, long face, which should keep any exhibit out of the prize list in good competitions. Let it, however, be clearly understood, I do not want eyes to have undue weight in the general conditions of cat judging; but they are important, and as such ought to have due and careful attention at the hands of breeders and judges alike. Two things in the judging of short-hairs weigh heavily with me, namely, pale colours and light-marked heads and white lips. These defects, in my opinion, ought to put out of the money those that possess them in good competition. I perfectly agree with Mr. House about the standards. They are useful both to the breeder and judge; but for the judge to take the standards and try to judge by them at any show would be foolish indeed. All judges are expected to know the varieties they are called upon to judge, and to have the faculty to weigh up the good points and defects of the specimens before them, and place them accordingly.”

MANAGEMENT OF SHOWS.

Now to turn our attention to the management of shows, and upon this question I feel I am fairly competent to give an opinion, as I have acted as show manager and as show secretary to some of our largest exhibitions in London and at Brighton. The office is indeed no sinecure, and very few fanciers, exhibitors, or visitors have any idea of the enormous amount of forethought required, to say nothing of physical and secretarial labours, to make a big show run smoothly. The responsibility also is great, for a conscientious manager feels he has valuable live stock in his temporary possession, of which he has, so to speak, to render up account. There are many mixed shows held throughout the country where a cat section is given, and it is to be regretted that in

most, if not all cases, the poor pussies are badly provided for and generally go to the wall. At a dog and cat show everything goes to the dogs! Secretaries wishing to promote successful cat sections at their mixed shows should secure some well-qualified person to have entire control of this department. It is certainly true that, of all live stock, cats require the most consideration and supervision, and yet to the masculine mind of a show secretary it would appear that the cats can look after themselves. There is no doubt that the first step towards making a show successful is to engage the services of a competent, energetic, and painstaking manager and secretary. It is also very desirable to appoint a really good working show committee, the members of which should each undertake some particular duty in connection with the show. For instance, one member might superintend the feeding, another could be responsible for obtaining promises of special prizes, another devote him- or herself to verifying the prize tickets placed on the pens, and so on. A system of advertising a show must be decided upon by the show committee, and notices sent to the various journals which are circulated amongst fanciers. The class and prize tickets must be ordered in good time either by the secretary of the club or the manager of the show.

The best time of the year for a show as regards the appearance of Persian cats is in December or January. Then, if ever, these particular cats should be in the best show condition. As regards kittens, the early summer or autumn is the best period, as spring kittens will then be ready to make their bow to the public. It is much to be regretted that the two principal shows of the National Cat Club—namely, the Botanic Gardens and the Crystal Palace Shows—should be held respectively in June and October, when Persian cats are in poor coat.

Quite three months before the date of the show a managing secretary will start work. Catalogues of previous shows must be collected together, in order to ascertain the names and addresses of likely exhibitors.

Special prizes are now a great feature at all cat shows, and a good deal of extra work is entailed by writing to obtain promises of these for the various breeds. If possible, it is well to appoint someone who is in touch with those who are likely to become donors, and to hand over this department. I would advise anyone undertaking this branch of the show to have a book, and to head each page with the respective classes of long and short-haired breeds, and then when a special is received—say, for the best black Persian cat—to place this on the page set apart for specials for this particular breed. Keep a separate list for kittens, and decline to accept specials given in the form of stud visits or for cats bred from such and such a sire; these savour too much of self-advertisement. There are so many specialist societies nowadays, and as these provide their own specials the show executive is considerably relieved of the duty of obtaining prizes. Of course, there are always a certain number of challenge cups, medals, and specials given by the club holding the show, and care should be taken to distribute these fairly amongst the various classes. It is usual and advisable to limit the competition of the majority of these special prizes to the members of the club. I do not approve of a special prize being offered for the best cat in the show, as it is almost impossible for the judges to arrive at a satisfactory decision, and considerable heartburnings are generally the result of such a competition. A very useful mode of assisting a show is by guaranteeing classes; and I would suggest yet another plan, namely, to subscribe so much towards the expenses of the show. These are necessarily heavy, and it has been stated that no cat show can ever be made a paying affair.

As regards the specialist societies, I think it seems the correct thing that the club intending to hold the show should instruct its secretary to write to the secretary of each specialist society to ask if he is willing to support the show by prizes or by guaranteeing classes, and to name the latest date for receiving particulars of the support to be given. The specialist societies have their own judges, and it is only natural when they are offering handsome prizes that a claim should be made for first-class judging in the interests of the breed. It is therefore essential, as matters at present stand, for one of the judges from the list of the specialist club to be selected to give awards in the classes connected with the society. It is important to obtain as full a list as possible of special prizes from societies and outside donors in good time for insertion in the schedule, as a tempting list will ensure a better entry. In the schedule the exhibition rules of the club should be printed, and in addition there should be a list of arrangements in a prominent position setting forth details as to the opening and closing of the show, the time up to which exhibits are received, the earliest hour at which they may be removed, and the prices of admission. The names of the judges, with their respective classes, should be clearly set forth, and it should be mentioned whether classes will or will not be amalgamated or cancelled. A few advertisements of stud cats and trade notices should be obtained, as this means grist to the mill and helps to pay for the printing of the schedules and catalogues.

[Illustration:

RICHMOND CAT SHOW: THE RING CLASS.

(_Photo: Cassell & Company, Limited._)]

The question of classification is an all-important one, and needs the consideration of a careful show committee, well versed in the ways of cats and of fanciers. A list of the classification used by one or two big cat clubs has been given. Of course, at smaller shows it is often impossible to give separate classes for several breeds or to divide the sexes; but my remarks in this chapter will refer to the customs and arrangements of large shows, such as those held by the National Cat Club at the Crystal Palace, and the Cat Club at Westminster. I do not think it is good policy on the part of a show committee or management to amalgamate classes. It is much better to advertise in schedules that when entries are fewer than, say, four or five, then the judges are empowered to withhold any of the prizes; or, again, in the case of a very small class, half prize money might be awarded.

[Illustration:

“MINDING SHOP.”

(_Photo: C. Reid, Wishaw._)]

Having decided on the classification, and given as liberal and attractive a one as is possible and practicable, it is well to consider the number of schedules likely to be required, and then start addressing the wrappers. In each schedule must be inserted two or three entry and registration forms. The entry forms, with fees, are returned to the secretary, and the registration forms to the person who keeps the register of the club holding the show. And here I would remark on the mistake it is to have two registers for cats. It is very confusing for exhibitors, and a double expense, as the National Cat Club and the Cat Club each charge a shilling. Then, again, as the National Cat Club has recently passed a rule disqualifying all cats exhibited at Cat Club shows, the confusion is worse confounded. Some fanciers having large catteries divide their exhibits and send to both National Cat Club and Cat Club shows; but this new registration rule falls heavily on cat fanciers who are keen to exhibit their specimens and anxious for the pleasure of obtaining prizes, and desire to profit by showing their stud cats or having an opportunity of disposing of their stock. The National Cat Club shows since the passing of this rule have suffered considerably, both from lack of entries and by the absence of some of the fine champion cats that, having been exhibited at the Cat Club show in January, were thus debarred from appearing at the Botanic Gardens and Crystal Palace shows. How much simpler and better it would be if both clubs could and would agree to have _one_ register kept by an independent person, not necessarily a catty individual, and that the fees should form the salary of such a person. A small fee might be charged when reference was desired by fanciers as to the pedigree of any cats. If the secretary of a show happens to be acquainted with the members of the cat fancy, he will be able to use his discretion as to the number of entry and registration forms needed. In some cases, where he is sending to a well-known breeder and possessor of a large cattery, more numerous forms will be required. Schedules should be sent out quite a clear month in advance, and the entries should close about ten days before the date of the show. The secretary will have a book in which he will note down each entry as it is received, placing it under the correct class heading, and, of course, these can only be numbered up when entries close. The entry forms should be filed and kept for reference. Then comes the work of arranging and writing the labels, and placing these with the tallies, entrance tickets, and removal orders in envelopes and addressing them to the exhibitors. These should be posted four clear days before the show.

During this time the secretary will be able to compile the catalogue for the printer, and arrange to have an instalment of copies the night before the opening day of the show, also to draw up the judges’ books. Letters should be written to the judges and veterinary surgeons acquainting them with the hour at which they are desired to present themselves at the hall, and a complimentary pass ticket should be enclosed. A pass should also be sent to the representatives of the Press, to the veterinary surgeon, and to those who may be giving their services as stewards. Distant exhibitors will write requesting catalogues to be forwarded to them, and a list should be kept. A secretary will do well to provide himself with strong cord, scissors, brown paper, writing materials, labels, telegraph forms, stamps, and other useful articles.

[Illustration:

“THIEVES.”

(_Photo: Mrs. S. F. Clarke._)]

In these days of specialist clubs it is necessary for the secretary to have a list of members of each society supporting the show, as the prizes being confined to members the judge will have to refer to the secretary’s office for information before making his awards.

The day before the show will be fully occupied in superintending the arrangement and putting up of the benching and pens. A conveniently sized glass case should be ordered for the special prizes, and this must be placed in a prominent position. The prizes should all be distinctly labelled with the donor's name and the breed of cat for which each is offered. The case should be one which locks up, and then it is not necessary to have any supervision of the contents. It is best for some two members of the show committee to undertake the arrangement in the case of the special prizes. Two men should be engaged to take the tickets and money at the entrance gate, and in the sales office a clerk will be required to receive purchase money and give receipts. At a large show it is necessary to employ four or six stewards to collect the judges' slips as they complete each class, and take them to those in the office appointed to write out the tickets. These same stewards should also undertake to place them on the pens. And here let me say how much better it would be if some arrangement could be made for the prize tickets to be fixed in a rack at the top of the pen, instead of being thrust between the wires, where a large number almost hide the cat, and frequently they are torn down by the inmates of the pen.

[Illustration:

MISS SIMPSON'S "CAMBYSES."

(_Photo: Gunn & Stewart, Richmond._)]

A good manager will have all in order well before the hour when the cats are received, and if the veterinary engaged is in attendance the cats can be examined and, when passed, placed at once in their proper pens. It is very important to entrust the work of penning to those who are used to handling cats, and no better men can be found than those employed by Messrs. Spratt, who, as everyone knows, are the universal providers at cat shows, as at every other live stock exhibition. It is a question whether hay or straw is best for bedding. I incline towards the latter if it is the fine wheaten straw, as hay, if it becomes at all damp, will stick to the long-coated cats. I also prefer dry earth at the back of the pens to sawdust, for the same reason. I trust we may ere long be able to provide something better in the way of a cat pen than those at present in use. The doors should open the full height of the cage and two thirds of the width, so that the cat can be more easily taken out.

[Illustration:

MRS. DRURY'S BROWN TABBY, "PERIWIG."

(_Photo: Kerby & Son, Ipswich._)]

There is no doubt that, considering the peculiar nature of cats, some more adequate arrangement should be made in the sanitary accommodation. The earth scattered at the back of the pen amongst the bedding is not all that could be desired. What we want is a false bottom, and an earth pan or tray sunk in it about two inches deep, on the plan of the bird cage, so that it can be drawn out and fresh earth supplied, and replaced. Greater care should be paid as regards the security of the fastenings of the pens, and the wires of some of them are too wide apart, so that young kittens can easily make an exit. It is well known that cats have extraordinary powers of escaping whenever and wherever escape is possible.

I disapprove as strongly as do the cats of any disinfectant being sprinkled or placed _inside_ the pens. Each pen must, of course, bear a number; but instead of the different classes being numbered, it is much better to have them named, and the large placards fixed high about the pens by means of split sticks of Japanese bamboo. Thus anyone seeking the blue or the brown tabby class will have no difficulty in locating it, even without a catalogue.

It is very important that all exhibits should be examined by a qualified veterinary surgeon before being penned, and if a cat is seriously ill the owner should be at once communicated with and the specimen returned. If it is a doubtful case, perhaps a running eye or high temperature, then the cat should be placed apart in a properly arranged, and if possible warmed, hospital room to be again examined. Remember it is always better to disappoint one exhibitor by refusing his cat, than to disgust everybody by bringing their carefully trained and dearly loved pets into contact with disease. It is necessary to appoint an official to check off each exhibit as it is passed, and in the event of pronounced illness or some other objectionable feature to make a note of this for future reference.

[Illustration:

A LITTER OF BLUES.

(_Photo: E. Landor, Ealing._)]

As regards the feeding of exhibits, I am in favour of raw beef or cooked meat cut into small pieces or else put through a mincing machine, and water to drink. For many reasons it is not desirable to provide milk; it is apt to turn sour, and it certainly more easily collects germs of disease, and so may prove a fruitful source of evil.

The Cat Club started the idea of having china saucers instead of the usual tins, and these are decidedly better in every way. A one-day show is no doubt best for the cats, but for the exhibitors and the executive a two-days show is really preferable. If the exhibits are allowed to be penned up till eleven o'clock on the morning of the show, the judging ought to be got through and the tickets placed on the pens in two hours with a competent staff, and the show opened at one or 1.30.

A smart secretary will arrange with his printer to have a list of awards printed with the utmost speed directly after the class judging is finished. This can either be given in the catalogues themselves or a separate sheet inserted in the catalogues. A large board ought to be hung in a conspicuous and convenient position, and the list of class winners and the winners of special prizes entered on it. This is better than having the slips pinned upon a board. They are often very indistinctly written, and are apt to get torn down. Let the closing hour on the first night be eight or nine o'clock, when the hall should be cleared and the pens covered over. I consider one good feed of raw meat ought to suffice during the day, with fresh water continually supplied. The hour for opening on the second day may be ten o'clock, and before then the pens ought to be cleaned out, fresh straw given where needed, and disinfectant sprinkled up and down the passages between the rows of pens—not in them. Careful attention to these points will ensure the show being free from disagreeable odours by the time the public are admitted. It is a wise plan to arrange and announce that the show closes, say, at five p.m. on the second day, so that exhibitors can, in many cases, get home with their cats the same night. It is unreasonable to expect to be allowed to depart before the time fixed, even though in some cases half an hour would save a train. As regards a one-day show, it is almost impossible for a secretary and manager to get through the necessary work and to open in anything like time. There must be a scramble, and for the exhibitors to be obliged to present themselves and their cats at some unearthly hour in the morning is very trying and most inconvenient. Then a two-days show is, of course, an advantage as regards the entrance money. The Cat Club used to have a stringent rule against exhibitors penning their own cats, but at the Westminster Show this rule was amended, and cats could be penned by their owners or representatives on the night before the show, but not in the morning. No evil result followed this concession on the part of the authorities, and therefore I trust this very natural desire on the part of the exhibitors to see their precious pussies safely into their temporary quarters may always be permitted at Cat Club shows.

In order to facilitate the work of the judges, it is well to have their books carefully and clearly arranged, and this especially applies to the list of special awards. I instituted a plan at Westminster Show, in 1901, which gave great satisfaction, but which entailed a lot of extra work for the secretary. I am sure, however, this special arrangement lightened the labours of the judges, and hastened the appearance of the special prize cards on the pens. I had separate books for the special awards, and carefully cut out of the schedules the prizes pertaining to each judge. Thus, if Mr. A. had black, white, and blue long-haired classes, every challenge medal and special offered for these cats I arranged in order on one side of the page, with the numbering as it appeared with them in the schedule. So in the left-hand page would be, say, "Special No. 10, for best long-haired black," and on the right-hand page "Awarded to No. ....," leaving a blank for the judge to fill in the number of the winner. Any prizes that had to be awarded in conjunction with other judges, such as for best long-haired cat in the show, I made a note of to this effect. Let me add that I gummed the printed portions relating to the prizes, cut from the schedule, into the judging books, so the judges needed neither schedule nor catalogue to refer to. In preparing judges' books it is very helpful to place male and female (M. and F.) after each catalogue number in the mixed kitten classes, to avoid reference for the special awards; and this should also be done in the catalogue itself, as very often the name of the kitten does not indicate the sex, and would-be purchasers are obliged to make inquiries.

I am always an advocate for having selling classes for cats and kittens at shows, where the price should be limited to £5 5s. in the long-haired classes, and £3 3s. in the short-haired classes. It would be an assistance if someone who understood cats, and was also a good salesman or saleswoman, undertook to preside over the selling classes. The 10 per cent. commission deducted by the show authorities is a material help, and often a little pressure and persuasion, combined with useful information, will decide a wavering purchaser. A class I should like to see introduced into our shows is one for kittens bred by exhibitors. I am of opinion that more encouragement should be given to fanciers to keep the best of their litters for exhibition. Lady Marcus Beresford had the happy inspiration of starting breeders' cups for competition at Cat Club shows, and special prizes are often given for the best kitten bred by exhibitors. But these are tiresome awards for a judge to make; he is obliged to make inquiries from someone with a

catalogue, and even this reference will not always suffice. It is always pleasant to win prizes, but an additional pride would naturally be felt if, in a large class of kittens bred by well-known exhibitors, the son or daughter of our own breeding should be awarded first and special.

JUDGING IN THE RING AT THE CRYSTAL PALACE.

(_Photo: Russell & Sons, Crystal Palace._)]

With respect to a ring class, which is often held at some of the National Cat Club shows, I cannot say that it is very interesting to see a collection of toms, females, and neuters, long- and short-haired, being dragged along by their anxious owners, whilst the puzzled judges try hard to decide which of the motley and mixed assembly is most worthy of honours. I think that for a ring class neuters alone should be eligible, or at any rate until we have trained our young cats to behave properly on a lead. There need be no necessity for the neuters to be entered and penned in the show, but they could be charged a higher fee for the ring class; and I believe that many owners of neuters would not object to their precious pets being on exhibition for ten or twenty minutes, led by themselves into the ring, but who will not let them be cramped up in a pen for two days. Neuters are always at a disadvantage in the show pen—they are generally too large and too lazy to be properly seen, and a ring class for these specimens would be a very attractive feature at our cat shows. A row of chairs should be placed round, and sixpence a seat charged. It is quite absurd to mix up the sexes, and dangerous to allow tom cats to come within fighting distance of each other. At a recent show great excitement was caused in the ring by the sudden attack of one famous stud cat on another, and it was lucky that nothing worse than a torn and bleeding ear was the result of this onslaught. Another class I should like to see at some of our large shows, and certainly at the summer N.C.C. Show, is a class for stud cats, which should be judged quite irrespective of coat, and special attention directed to form of limb, size of head, and massive build in awarding the prizes. This might not be an attractive class, but it would be an instructive one, and give the veterans a chance of proving of what stuff they are made. A young untried male will often take all the honours in his class, and the stud cat of a busy season is forced to take a back place, probably on account of services rendered. Anyhow, this idea might be carried out as regards the two largest classes—namely, those for silver and blue Persians. In former days there used to be classes at some of the shows in which the cats were judged by weight, but these have wisely been done away with.

[Illustration:

MISS KIRKPATRICK'S BLUE KITTENS.

(_Photo: E. Landor, Ealing._)]

The question of open judging at cat shows has frequently been discussed in catty circles, and several fanciers have given their opinions on this subject. Mrs. Neate, a well-known fancier, writes thus in _Fur and Feather_:—"It would indeed be a step in the right direction if cat shows were run on (as far as possible) the same lines as dog shows. Much of the absurd mystery that at present envelops our cat shows would vanish if exhibitors were permitted to be present during the judging, and I feel sure that the majority of cat fanciers would not be so wanting in etiquette and good taste as to hinder the judges or any of the officials in discharge of their onerous duties." No doubt there is much truth in these remarks; but, at the same time, I do not think fanciers take sufficiently into consideration the very timid, shrinking nature of the cat when they advocate open judging. It is often most difficult for a judge to properly examine a cat, even when he or she is quietly going round giving the awards; it would be still more trying to man and beast if a collection of strangers were pressing forward on all sides.

What I consider is more practical than open judging for cats is that some arrangement should be made so that judges may be enabled to compare the points of the various exhibits, and for this purpose I consider that judging pens on movable tables should be provided at all shows, as were adopted by the Cat Club at Westminster. By these means the work of the judges would be much simplified, and the cats more satisfactorily and quickly judged.

Supposing a special prize or medal is offered for the best cat in the show, then I think it is interesting and instructive to have the first prize-winning cats placed, if possible, in pens, and to arrange for the award to be given in public during the show by the judges in conjunction with each other. Such a plan was adopted at the last Manchester Cat Show, and much satisfaction was expressed at this innovation.

Having given some suggestions as to the classification, I would again refer to points of management in shows. At the closing hour on the second day the hall should be cleared, and only exhibitors or their representatives allowed to remain. An efficient staff of attendants should at once set to work to assist in packing up the cats belonging to those exhibitors who intend taking them away. After these have all left, then the manager should direct his attention towards those exhibits that should be started by the night mails. The catalogue must be consulted, and a good way is to mark with a cross on the pen tickets those cats that must be packed up; and, having previously ordered the railway vans at a certain time, the precious packages should be sent off as speedily as possible. Those exhibits left over till the following morning should be fed again and started at daybreak.

[Illustration:

“ROSE OF PERSIA.”

(_Photo: E. Landor, Ealing._)]

There is a sense of immense relief when the last hamper has been fastened down and seen off the premises. And here let me say how much exhibitors can contribute towards the speedy and safe despatch of their pets, if only they will provide substantial and well-appointed travelling baskets or boxes. Amidst all the hurry and confusion of packing up an immense amount of extra trouble is given by having to lace up a hamper with string, or nail down a box that has no other means of being made secure! I speak from experience, and therefore I plead for more consideration to be extended to the show manager and his assistants, and, above all, to the poor pussies themselves.

At every show that is held there are a number of exhibitors who try the patience and courtesy of the manager or secretary, or both, by requesting to be allowed to remove their cats before the advertised time. Of course, it is only natural that those fanciers residing at a distance should wish to make tracks home and catch early trains for their own comfort and convenience and the welfare of their pussies. But, looking at the matter from a secretary’s and a visitor’s point of view, it is certainly hard that perhaps some of the best prize cats should be absent from their pen whilst the public are paying their money at the gate; but, having made a rule, it is best to stick to it, and no cat should be taken away till the fixed hour under any pretext whatever, unless a veterinary certificate of illness is obtained.

It is always open to the management to advertise an earlier hour for the removal of exhibits on payment of a certain sum, but this should be made a substantial fine, especially in the case of a prize-winner. A lower figure might be named for other exhibits. As regards cats or kittens purchased at the show, it is certainly an inducement and incentive to buyers if there is a rule that these exhibits may be removed at any time.

According to the rules of the two leading clubs a certain fixed time must elapse before the prizes are sent out. In some cases this is a most uncertain and unfixed time, and many complaints have been made through the cat papers of the long drawn out period between the prize being won and the prize being received. No doubt, immediate distribution of prizes after the show would lead to complications, for objections might be lodged within the given time allowed by the rules, and such objections would have to be brought before the committee of the club; therefore it is obvious that successful competitors must allow, say, a month to elapse before showing signs of impatience. It is then the manager’s business to send the money awards, and the secretary of the club is generally accountable for the distribution of the “specials,” which certainly call for a special acknowledgment from the recipient to the donor of these prizes.

As regards the financial aspect of a cat show, the first important point is to make the entries pay for themselves—that is, supposing your prize money in each class is £1, 10s., and 5s., then you need twelve entries at 3s. to carry you through. And here let me remark that, considering the character of our first-class shows and the value of the special prizes offered, I am inclined to think that entry fees are too low, and that they should be more in accordance with the fees charged at dog shows. It is always advisable to make a difference between members of the club holding the show and outsiders. Thus, if 5s. is the entry fee for members, then 6s. or 7s. 6d. might be charged to non-members. New recruits to a club are often gained by this arrangement. The usual commission on sales is 10 per cent., and then there is the gate money, which somehow is generally disappointing, for truly the outside public are not partial to cats, nor attracted to exhibitions of the feline race. I have always contended that exhibitors themselves ought to be charged an entrance fee—say, half-price admission on presentation of their exhibitor’s pass, which in many cases would only be sixpence, yet one or two hundred of these small coins would materially assist the exchequer; and surely no cat fancier would grumble at this tax on their resources when they consider how much trouble and expense is entailed in providing them with a favourable opportunity of exhibiting their pets, and with a possibility of winning golden guineas and silver trophies.

Another plan is to advertise in schedules that exhibitors of more than, say, two entries would be allowed a free pass. Fanciers will be tempted to send additional cats, and thus swell the entries, in order to secure their free admission ticket. I do not think it would be a bad plan to have a “Contribution Column” on the entry forms for members’ and exhibitors’ voluntary donations towards the expenses of a show which, if well managed, is worthy of the utmost support from the cat-loving community.

“Every mickle makes a muckle,” and it should be the earnest desire of each individual member of a club to do something, however small, towards keeping a balance on the right side of their treasurer’s accounts.

BUYING AND SELLING.

I believe that a Bow Street magistrate once asserted that anyone owning a stud dog or selling a dog was, in the point of law, a dealer. I do not know if the same decision would apply in the cat world. Anyhow, there are few fanciers who do not desire at some time or other to dispose of their cats and kits; and, again, there are many who keep stud cats, yet cannot be considered dealers in that sense of the term. The best way to set about trying to sell our surplus stock is to advertise in the cat papers, in which case it is advisable to fully and fairly describe our animals and to name the price required. If profit is to be considered, it is not advisable to keep kittens more than eight weeks. Very soon after this period they begin to lose their fluffiness and grow leggy in appearance. There is also the risk of illness and death. It is better, therefore, to be willing to accept a moderate sum for kittens at eight weeks old rather than to keep them to see how they turn out. It is a clear case of “a bird in the hand is worth two in the bush.”

I have always thought that there is a good opening for any enterprising person well versed in cat lore and cat fanciers to start an agency in London, where cats and kittens might be sent on approval, for would-be purchasers to call and interview them. There might be a system of messengers who would meet cats and see them off at London stations. In connection with such a cat agency a register might be kept of cats for sale or cats wanted and arrangements made as at the Army and Navy Stores for having a certain number of animals on view. These could be boarded at so much per week, and commission charged on the sale.

A list of names and addresses of those willing to receive cats as boarders would be very useful, and many ladies who do not choose to advertise could and would, I am sure, avail themselves of the means of letting fanciers know they could undertake the charge of pets during their owners’ absence from home. Many and frequent are the letters I receive on this subject, especially as the summer vacation approaches.

A day and hour for the visit of an experienced veterinary might be arranged, so that country fanciers could send or bring their sick cats for advice. All sorts of cat appliances might be on sale. It would be convenient to have a writing-room for the use of fanciers, where correspondence on catty matters could be carried on. Perhaps a tearoom could be added, and bedrooms, if space was available, for fanciers coming up to attend London shows. Anyhow, a list of suitable rooms might be kept which could be personally recommended.

These Forms, at 8d. per dozen, can be obtained on application to Miss F. SIMPSON, Hon. Sec., 9, Leonard Place, Kensington, W.

In these days, when competition is so keen and occupation so difficult to obtain, the idea of starting a cat agency should commend itself to some who, being in touch with members of the cat fancy, and wishing for lucrative employment, might embark on this novel undertaking. Needless to say, it would be most desirable to have the cat agency in a central part of London, and in close proximity, if possible, to some of the main railway stations. I think that, if only as a means of assisting fanciers in the purchase and disposal of their cats and kittens, this idea of an agency might be successfully worked. Many breeders become very disheartened at the inability to find purchasers for their kittens. A complaint was recently made by a lady living in the Isle of Wight. She writes: “No one seems to care for breeding in this island, and people are not willing to give more than about five shillings for pedigree kittens.” No doubt fanciers living in the country and away from any catty centre have but little opportunity of finding a sale for their surplus stock. I would suggest photography as one means of making known the perfections of their pussies. A start in the right direction has been made by Mr. Landor, of Ealing, whose clever pictures of kittens are so well known. He is willing to take portraits of pretty, fluffy kits and good cats on special terms, provided he retains the copyright of such photographs. It is always handy to have a good photograph to send by post when endeavouring to dispose of our pets, and by such means fanciers may be spared the trouble and risk of sending their valuable kittens on approval.

[Illustration:

“MISCHIEF.”

(_Photo: Mrs. S. F. Clarke._)]

Naturally, for unknown cat fanciers it is more difficult to effect sales through advertisement, and in their case it is necessary to offer to send on approval at buyer’s risk and cost; and if an application is made from an entire stranger, then the purchase money should be deposited in the hands of some reliable and independent third person. Some fanciers entirely decline to send their cats on approval, and then it is very requisite to enter fully into particulars, and, if possible, to send a photograph. It is best to give the faults and failings as well as the good points, so that disappointment and disagreement may not follow between the purchaser and seller. Buyers should endeavour to learn something about the person from whom they purchase their cats; and it as well to ask not only for age and full pedigree, but whether the cat has been exhibited, and if it has taken any honours, and at which shows. It sometimes happens that valuable animals may be picked up for low prices at shows; but there is always a risk, and this is especially the case with young kittens, who more easily contract any disease. In buying a cat or kitten it is always advisable to make inquiries as to the way in which it has been fed, so as to continue the same regimen for at least a few days. The pedigree of a cat or kitten should be sent at the time of purchase, and it is much easier to fill this in on a properly drawn out form, and certainly it is pleasanter to receive the particulars thus intelligently written out. I give a copy of the forms I drew out for the use of blue Persian members, but these can, of course, be used for cats of any breed.

[Illustration:

OUR PLAY-ROOM.

(_From a Painting by Madame Ronner._)]

Here let me quote from an article in that excellent American paper, _The Cat Journal_, headed “Unreasonable Buyers.” The writer says:—“One of the most difficult things with which the cat seller has to contend is the unreasonable buyer. There are buyers who, finding a cat to suit them, pay the price and are satisfied. There is, however, another class that it is best to let alone. They are never satisfied, and blame the seller for everything that happens either on the road or after the kitten is received, and many of them also think if they are sharp they will be able to buy a $100 kitten for $10 or $15, and when they get such a kitten and they discover that it is not worth $100, they are disgusted, and have a lot to say about unfair dealing, etc. If a kitten that has been a pet is taken from its surroundings, and sent on a long journey, the rattle and the unusual conditions of such a trip places her in a state of nervous terror, so that she very rarely shows off to good advantage in her new home. The purchaser, if a true cat lover, will appreciate all the trouble of poor little pussy, and give her the tenderest treatment and coax her to make the best of her new surroundings. It is a very rare thing for a kitten to come from the box after a long journey looking just as the new owner expected. Tired, homesick, and frightened, she will not eat, and is altogether a pitiable looking object. It is always advisable to put a new arrival in a room by herself, with a comfortable bed and conveniences, entirely away from the rest of the cats and kittens, and allow her to become acquainted with the members of the family gradually. Do not allow other cats to come bothering around till the new member of the family is entirely acquainted with its surroundings. Especially be very cautious in introducing two male cats.

“Sellers must be very cautious in sending out their stock, and buyers must not expect too much. Give the new member of the family a little time to know things before you write your letter of complaint. Be sure you are not expecting too much for the price you paid.”

The question has often been asked, “Can cats be made to pay?” and, naturally, novices in the fancy wish to know the best way in which to make a good start.

Here I would say how much may be done by well-known and influential members of any fancy if they will give themselves a little trouble in helping the novice, who, after all, is the backbone, so to speak, of every fancy, and hence it is very essential that beginners should start on the right lines and with reliable, and therefore profitable, stock. Speaking from experience in the cat fancy, I can say that several persons have come into the ranks and gone out of it again, in many cases through sheer disgust because of the deceptions practised, and of which they, as novices, have been made the victims. I hold that if beginners are to be retained as members of a fancy, they should be treated kindly and liberally by the experienced fancier, especially when it is a question of purchasing stock. It is much to be lamented that novices are frequently treated in a reverse manner, and fanciers (so-called) seize upon an opportunity of getting rid of superfluous and often inferior specimens to those who are unable to discover good from bad in the cats offered to them.

At the same time, it is a pleasing fact that there are many true fanciers in the feline world who, having made their names as breeders, prize-winners, and perhaps judges, put themselves out to give valuable advice, and often spare no pains in endeavouring to obtain good stock for the novice at reasonable prices.

Another question often asked is, “Does showing pay?” In answer to this query, I give an extract from the pen of the clever weekly correspondent of _Fur and Feather_, “Zaida,” who says:—“To those who keep their cats for pleasure, who really love them and can afford to despise the small ‘takings’ available, keep your cats at home and do not show. Expense does not count with this class of exhibitor, but risk to the welfare of their best-beloved pussies undoubtedly does. To those who are trying to make money by their cats, we would urge: harden your hearts, learn how to show, where to show, and when to show; and recognise the expense, risk, and trouble involved as part of the unavoidable outlay which is to bring in a certain return. Undoubtedly, a show is a heavy expense, and will always leave you out of pocket. Even if you conduct it on the most selfish terms—the ‘give-nothing’ and ‘take-all-you-can’ system—you will be exceptionally lucky if you clear your expenses. You cannot expect to sell your kittens well if you do not exhibit.

“If you possess a stud cat, he must be seen and known before you can hope to have a demand for his services. Your own eye must be continually trained by comparison of your own stock with the prize specimens of others. In short, if you wish to make money, you must spend money. On the other hand, never exhibit except at first-rate shows, and never be tempted to show an animal out of condition. If you can afford to buy animals already well known in the show world, cats of renown, for whose offspring there will always be a keen demand, you may possibly abstain from exhibition. This plan, however, involves a very large initial outlay. Then, again, the happy people who have won their laurels, whose names are always associated with first-rate animals of a particular breed, they, indeed, can afford to rest in peace, and show no more. Other people will buy their kittens, and do their exhibiting for them, and also do that mournful nursing and burying that too often follows a show. Undoubtedly, it is fascinating to show successfully; but, on the whole, we think the most enjoyable shows are those where one goes to look at other people’s exhibits and leave one’s own at home.”

A few words as to the stud fees and arrangements for visiting queens will not here be out of place. The usual fee for the services of a stud cat is fixed at £1 1s., but some fanciers are willing to accept less, especially if their cat is not a well-known prize-winner. A higher charge is often made if the railway journey has to be followed by a cab fare, or if the owner, having a valuable stud cat, does not wish to encourage many visitors. The carriage of the queen should always be defrayed by the sender, and if a telegram and return insurance is desired, then these sums expended should be refunded to the owner of the stud cat. It is desirable to announce the despatch or intended despatch of a queen, as it may not be convenient to receive her. The usual time to keep a visitor is from three to six days, and then the owner of the stud cat should give notice of the return. In case the first visit proves unsuccessful a second visit is usually allowed by courtesy without any extra payment, but this must not be taken as a matter of course, and it is best for the owner of the queen to ask permission to send again. If through a mistake in the time of sending a cat apparently fails to mate during two visits, it can only be by the kindness of the stud cat’s owner that a third visit is permitted for the one fee. If, however, the queen has been known to have mated on each occasion, a third visit gratis cannot be expected even if there is no result. A fee once paid for a visit is not returnable. It is sometimes a matter of arrangement between fanciers to have the choice of a kitten instead of the mating fee, but this transaction does not commend itself unless the parties are on very friendly terms. A clear understanding should be arrived at on all occasions between the sender and the receiver, and thus any after unpleasantness may

be avoided. It is catty etiquette to forward the fee when sending the queen; or, at latest, immediately on her return. A label for the return journey should be fixed inside the lid of the hamper. This is a saving of trouble to the owner of the stud, and is also a means of identification.

[Illustration:

MR. F. W. WESTERN, THE SECRETARY OF THE SANDY CLUB SHOW.

(_Photo: Kingham, Bedford._)]

In selecting a young kitten for purchase out of a litter, take note of the size of head and width between the ears. In self-coloured kits look out for white spots, and avoid those with long tails. Fanciers should strive to resist the temptation of buying too many cats and kittens of different breeds. To the novice and the beginner I would say, Buy two or three good specimens, carefully selected; these will be worth quantities of doubtful ones, which, as a matter of fact, have, as a rule, no value at all. Seize every opportunity which comes across your path of seeing and examining well-bred, prize-winning cats, and attending shows. The cleverest fancier and most successful breeder can improve himself by observation and education.

Do not be offended if you are told by those who have had a larger and longer experience in the fancy, and who are really experts, that you have made a mistake in any purchase. If you resent their criticisms, you may, and probably will, accumulate much rubbish as a monument of your own conceit. A great deal may be learnt from books, but more from observation. Above all, do not, when you have acquired some knowledge, form too high an estimate of your own powers and of your own cats; a true fancier is always ready—nay, anxious—to learn, well recognising that ignorance alone claims to be omniscient.

LOCAL SHOWS.

As an example of the ever-increasing interest shown in cat sections at local shows, the following account, kindly supplied to me by Mr. F. W. Western, the secretary, will be of interest:—

[Illustration:

OFFICIALS OF THE N.C.C.C.

(_Photo: Mrs. G. H. Walker._)]

“Sandy Show has long since outgrown in size and importance the title it bears, viz. ‘The Exhibition of the Sandy and District Floral and Horticultural Society.’ The first schedule, issued in 1869, catered for plants, flowers, fruit, vegetables, poultry, and cage birds. In 1880 pigeons were introduced, and in 1883 rabbits were added. Later, in 1899, dogs put in an appearance with four classes. It was not, however, until 1894 that our friend ‘pussy,’ in whom we are especially interested, made her _debut_ at Sandy, and as we look at the schedule for that year we are driven to the conclusion that none but a philosopher could have drawn up such a classification for our pets. The trouble which we now frequently experience at a cat show of being ‘wrong classed’ could not well arise on that happy day in August 1894, when eight catteries were represented in the one and only class, viz. ‘Any variety, any age, male or female.’ But if our pets made a modest bow to the public in that year, they have lived to be proud of their position. In the succeeding year three classes were provided, bringing together 31 cats. From this date the cat classes have shown substantial improvement. The year 1900 found Sandy with five classes and 41 entries. By this time the cat fancy throughout the country had come into prominence; clubs had been established, and specialist societies were springing into existence. With a leap forward the cat section of the 1901 show numbered 20 classes. This was far too bold a bid for popularity to be lightly esteemed. The support was obtained of the Cat Club, the Silver Society (to-day the Silver and Smoke Persian Cat Society), the Short-haired Cat Society, and the Siamese Club.

“Generous aid was given by many individual lovers of cats, and fifty special prizes, in addition to the class prize money, were offered. The show was attended with success, both as regards the number (about 150) and the quality of the exhibits. From a public point of view, moreover, the result was most gratifying.

“The cat tent was crowded throughout the day, and this section was acknowledged on every hand to have been one of the best features of the show.

“With such success attending their first earnest venture in cats, it is not surprising to find that the committee resolved still further to increase the classification. In August 1902, therefore, 32 classes were arranged, of which 21 were guaranteed. Special prizes numbered 85, and the cat section had the support of all the specialist societies.

“With such attractions the splendid entry of 1901 was eclipsed, and at the very worst time of the year for cats as many as 266 entries were made. Long-haired cats were decidedly well represented, and in the blue kitten class 21 specimens were penned. In the short-haired classes some noted winners appeared.

“Ring classes were provided, and proved a great attraction to the public. The local classes were proof that Mrs. F. W. Western has succeeded in interesting some of her friends in the hobby, and the specimens to which the honours fell would have done well in the keenest competition.”

Mention was made in the list of clubs on a previous page of the Northern Counties Cat Club, which was founded in 1900. The committee decided on holding a one-day kitten show in September of that year, and the judges selected were Miss D. Champion, Miss Frances Simpson, Mr. T. B. Mason, and Mr. L. P. Astley. Entries came up well, numbering 154, and this novel undertaking was in every way a great success. The Northern Counties Cat Club kitten show is now an annual fixture, and on October 1st of 1902 a really splendid exhibition of promising youngsters was held at Bellevue, Manchester. Twenty-two classes were arranged, and over fifty specials offered. Entries were twenty in excess of the previous year, and would have been still higher in number had not sickness prevented several well-known silver breeders from exhibiting. The litter class numbered 17, and these, with the splendid blue classes, were the chief glory of the show. There were 18 pairs of blue kittens and 40 entries in single blue kittens, and it was most noticeable how few of these specimens failed in eyes. There were rows of gleaming orange orbs that rejoiced the heart of the Hon. Sec. of the Blue Persian Cat Society.

The kitten show of 1902 may fairly be classed as another success for the Northern Club.

A similar show for cats and kittens is held annually in December in Manchester by this enterprising club. I am indebted to Mrs. G. H. Walker for the group of officials and members of the Northern Club. The photo was taken by Mrs. Walker at the Manchester kitten show of 1902.

In connection with the dog show of the Ladies’ Kennel Association, an exhibition of cats is now held annually at Harrogate under the rules and patronage of the National Cat Club. The first venture in this popular and fashionable water resort was made by Mrs. Stennard Robinson in 1901, when entries came in splendidly; but rain descended most disastrously, and seriously interfered with the success of the show and the attendance of visitors. In 1902 the weather proved most favourable, but the cat section suffered considerably as regards numbers of exhibits in consequence of the date clashing with that of the Sandy Show, held also on August 28th. On this occasion the Hon. Mrs. McLaren Morrison was advertised as judge, but owing to ill-health her place was taken by Mrs. Stennard Robinson, and Mr. J. B. Townend, of the National Cat Club, undertook the management. The Midland Counties Cat Club held its first show in Birmingham. The classification was on a liberal scale, and several of the classes were guaranteed. Several of the specialist clubs supported this first venture of the Midland Counties Cat Club. A new departure in the matter of shows may shortly be attempted, and a scheme has been submitted to the cat world by the Hon. Sec. of the Silver and Smoke Persian Cat Society, that the specialist societies should combine and hold a show in the West of England. Each society is to be asked to bear a part in the expenses, and secretaries will probably hold a meeting to consider the best ways and means of carrying out such an undertaking. It is not intended that such a show should be in any opposition to those held by the parent clubs, and registration in either of these clubs will be enforced; but, to quote the words of a well-known fancier and supporter of the specialist societies, “It is simply a way of escape from the enforced division of interests, and a means for permitting the cats of all club persuasions to meet on equal ground. As matters now stand, open competition is a thing of the past, and the sooner it becomes a possibility again the better for the cat fancy. On this ground, therefore, we think all unbiased minds will accept with pleasure the scheme submitted to the public by the secretary of the S.S.P.C.S.”

The Scottish Cat Club, which has Lady Marcus Beresford for its President, holds its annual show during the winter months, and its exhibition follows closely on that of the Midland Counties.

Under the list of winter shows mention may be made of the following, where, in connection with other live stock, cats play a more or less important part:—Peterborough, Sheffield, Hounslow, Kendal, Bedford, Caterham, Hinckley, Hamilton, Doncaster, Yarmouth, Stratford-on-Avon, Bristol, Haverfordwest, Stockton, Cheltenham, Taunton, Epsom, Hexham, Larkhall, Stirling.

In this list I have made no mention of the great championship show of the National Cat Club, held annually at the Crystal Palace in October, to which the whole of cat creation looks forward with awe and longing. This is one of the greatest events in the cat world, and is always eagerly looked forward to by fanciers in all parts of the British Isles. In the schedule for the exhibition in 1902 no fewer than 216 special prizes were offered. Many of these were given by the following specialist clubs, who generously supported this annual fixture:—The Blue Persian Cat Society, the Silver and Smoke Persian Cat Society, the Chinchilla Cat Club, the Orange, Cream and Tortoiseshell Society, the Siamese Cat Club, the Manx Cat Club, and the British Cat Club.

The names of the judges acting on this occasion were as follow:—Mrs. Greenwood, Miss Forestier-Walker, Miss G. Jay, Miss Cochran, Miss F. Simpson, Mr. Louis Wain, Mr. Sam Woodiwiss, Mr. C. A. House, and Mr. Jung.

In our latter-day shows the work of the judges is considerably augmented by the numerous specials that have to be awarded amongst the winners in the well-filled classes, and as regards the Crystal Palace show of 1902, the patience and skill of the judges making these awards were taxed to the uttermost.

[Illustration:

SILVER CATS BELONGING TO MRS. CLARK, OF ASHBRITTLE.]

The Cat Club’s show has been held for three years in succession at St. Stephen’s Hall, Westminster Aquarium, about the beginning of January, and it is at this season that the really finest exhibition of Persian cats is witnessed, for at no other time are long-haired cats in such grand coat and good condition as in the middle of winter.

It is no wonder, therefore, with so many shows held throughout the length and breadth of the land, that the cult of the cat is becoming more and more widely known and appreciated, and that the fancy is really assuming such proportions that there can be no doubt of its permanent position amongst us.

CHAPTER VI. THE “POINTS” OF A CAT.

Before entering upon the distinctive breeds of cats, of which I propose to treat fully in the ensuing chapters, I would draw attention to the accompanying diagram of a cat, and will proceed to point out the general contour of the animal, whether long or short-haired.

[Illustration: [THE “POINTS” OF A CAT.]]

Having given a table of reference, I will take the points of the cat as arranged in order:—

No. 1, Ears: These should be small, and rounded at the tops, carried somewhat forward, and not wide open at the base. In the Persian varieties especially the inner surface should be hidden by a growth of fur extending from the face, termed ear tufts. It is a beauty in the cat to have the ears set well apart, giving an appearance of greater width to the head. The outer portion of the ears should be evenly covered with soft, short, downy fur.

No. 2, Eyes: These ought to be round, large, and full. A small, beady eye is a great disfigurement in a cat. The eyes should be set straight in the head, not slanting like those of a Chinese. In the Persian varieties a fringe of overhanging fur greatly improves and softens the expression. The colour varies in different breeds, but in green, orange, or blue eyes, purity and depth of colour should prevail. Very often an orange eye is spoilt by an inner rim of green, and a blue eye is weakened by a paler shade of blue, giving the appearance of an opal.

No. 3, Skull: Should be broad, with width between the eyes and ears.

No. 4, Cheeks: Well developed.

No. 5, Face and nose: These should be short; if the contrary, a “snipey” appearance is given to the cat, which quite spoils the expression.

No. 6, Chest: Should be full and broad.

No. 7, Neck: Short and full.

Nos. 8 and 9, Shoulder and fore arm: These call for no special remarks; but in male cats especially firm and massive limbs are most desirable.

No. 10, Paw: A large, broad paw, with short but not stumpy feet. In the Persian varieties the tufts are an additional beauty.

Nos. 11 and 12, Body and back: There is a diversity of opinion as to whether a cat should be long in the body or of cobby build. I incline to the latter as regards beauty of form, but I am of opinion that female cats with long bodies are the best breeders. All cats should be low in the legs.

No. 13, Tail or brush: In both breeds this should be short rather than long, and in the Persian varieties broad and spreading. The tail should be carried almost on a level with the body, and slightly curving upwards towards the end. A too-tapering tail is a defect.

Nos. 14, 15, and 16 call for no further remark beyond the desirability of symmetry in form.

The foregoing list of points in a cat may be of some service to novices in the fancy, but it is necessary to add that, as in all animals, condition is a very important factor. A cat may be perfect in all points, and yet if in either the long- or short-haired varieties the coat lacks softness of texture, and in Persians the fur is matted or draggled, such specimens cannot expect to find favour in the eyes of a critical judge, or even an ordinary lover of cats. In short-haired breeds there is an unmistakable gloss on the coat of a cat that is in good health. A spiky appearance of the fur always denotes poor condition, and greatly detracts from the charms and chances of our pets or show cats. A great deal depends in keen competition upon condition. It turns the scale in a vast majority of instances. Therefore, as great attention should be paid to this point as to those set forth in the list I have given.

A small yet distinctive feature in a cat is the whiskers, and these vary in colour, according to the breed. They should be strong and yet sensitive, and curving slightly inwards. It is supposed to be a sign of strength if a cat’s whiskers attain a great length.

A BLUE PERSIAN BELONGING TO MRS. WELLS.

(_Photo: Ward, Hounslow._)]

CHAPTER VII. LONG-HAIRED OR PERSIAN CATS.

In classing all long-haired cats as Persians I may be wrong, but the distinctions, apparently with hardly any difference, between Angoras and Persians are of so fine a nature that I must be pardoned if I ignore the class of cat commonly called Angora, which seems gradually to have disappeared from our midst. Certainly, at our large shows there is no special classification given for Angoras, and in response to many inquiries from animal fanciers I have never been able to obtain any definite information as to the difference between a Persian and an Angora cat. Mr. Harrison Weir, in his book on cats, states that the Angora differs somewhat from the Persian in that the head is rather smaller and ears larger, fur more silky with a tendency to woolliness.

It is, however, my intention to confine my division of cats to long-haired or Persian cats, and short-haired or English and foreign cats. In both these breeds there are “self-coloured,” “broken-coloured,” and “any other coloured” varieties.

In the foregoing references to the diagram of the cat I have touched upon the points of the animal, which are practically the same as regards the form of body and limb in both long- and short-haired breeds of cats.

In comparing the dispositions of these two breeds, I think it is generally allowed that Persian cats are not so amiable, or so reliable in their temper, as the short-haired varieties. I am inclined to think, however, that they are more intelligent, and have a greater

instinctive desire to make themselves at home in their surroundings. They are apparently as keen hunters of prey as the short-haired cats. When we come to the question of stamina and general health, I certainly think the Persian must, so to speak, “go to the wall.”

It is a common belief that, in human beings, if the hair grows long and thick it is a sign of great strength and a good constitution; but as regards cats the longer the coat the weaker the animal. This I have specially noticed in Persian kittens, and have remarked that little mites with unusually long fur are the most difficult to rear, and suffer from extreme delicacy. Perhaps in-breeding amongst Persian varieties has been more carried on than with the short-haired breeds, which are allowed a greater freedom of choice, and therefore are the result of natural selection.

Apart from the question of health and strength, Persian cats require a great deal more care and attention on account of the long fur. In the spring Persian cats begin to shed their coats, and this process continues through the summer months, and it is not till about October that the new fur begins to grow again. Persian cats may be considered in their finest condition during the months of December and January. It is a wise provision of Nature that during the coldest months these somewhat delicate cats should have their warmest clothing. It has often been a matter of surprise that cat shows should ever be held in the summer, when long-haired pussies present a most unkempt and moth-eaten appearance. In this condition they are not likely to win converts to the cult of the cat; but from an educational point of view these unclothed specimens give the judge an opportunity of displaying his ability, for it needs a really capable judge, with experience, knowledge, and good common-sense, to allow for absence of coat, and to place the awards accordingly. Under summer skies shape and bone will have their innings, whereas a grand winter coat may hide a multitude of sins that even the eagle eye of the most astute judge may fail to discover.

At the same time, for a breed of cats called “long-haired” the coat ought to demand the greatest consideration; for what is the good of the most perfect shape in a Persian cat, if it is exhibited out of coat and almost like an English short-hair in a class set apart for long-haired specimens? No doubt many breeders of Persians have been led through disappointment to join the ranks of short-hair breeders, for it is indeed very vexatious and tantalising, after having entered a grand-coated cat a month before a show, to find your precious pet persistently scratching out her fluffy frill and shedding the chief glory of her breed before the eventful day when you had hoped to reap golden awards.

[Illustration:

“GENTIAN,” OWNED BY LADY MARCUS BERESFORD.

(_Photo: E. Landor, Ealing._)]

As regards Persian kittens, the change of coat takes place between the ages of three and six months. In some cases long-haired kittens will cast their fur to such an extent as to present the appearance of an uneven short-haired specimen, whereas in others the shedding process is so gradual that the transition stage from a kitten to a cat is hardly more discernible in the long- than in the short-haired breeds. Any severe illness may cause the fur to come out of Persian cats at any season of the year, and the growth of the new coat will be retarded by poor condition of the skin. In both long- and short-haired cats, as in other animals, the teeth are the chief guide in deciding the age, and a kitten may be said to become a cat after six months, when the adult dental process is completed, and the second set of teeth has become established. And here I would quote from Mr. John Jennings’ interesting book on “Domestic or Fancy Cats” in support of my twofold classification: “Of the many varieties or breeds of the cat with which we are now familiar, it must be remembered that, however crossed, selected, re-crossed, domesticated, or what not, we have but two breeds on which the superstructure of what is known to-day as the ‘classification of varieties’ has been reared—viz. the long-hair or Eastern cat, and the short-hair or European. The term ‘breed’ is even here used advisedly, for whatever the outer covering or coat, colour, or length of fur, the contour of each and all is practically the same.

[Illustration:

MRS. HERRING’S “CHAMPION JIMMY.”

(_Photo: W. Morice, Lewisham High Road._)]

“Nor is this confined to mere outline. Take the skull, for example, which measured in the usual manner with shot, making due allowance for difference in size, is not only similar in the different varieties of either long- or short-hair, but even in the wild cat the anatomy is similar, the slight variation being in a great measure explained by its different conditions of life and diet, and is in unison

with the fact of how even the ordinary domestic cat will undergo a change in taking up a semi-wild, outdoor existence."

At the present time there is no doubt that long-haired cats are the more popular, and, judging by the entries at our large shows, the numbers may be taken as four to one. A slight reaction has set in since short-haired societies have been formed, but the fascination for fluffy pets and pretty pussies will, I think, always predominate, for the less attractive points of the English domestic cat do not appeal so strongly to the heart and the eye of the general public.

It may be remarked by the readers of "The Book of the Cat" that very few pictures of short-haired cats are reproduced; and it is just because the long-haired pussies are so much more attractive that they are brought into greater prominence in this work. It is more difficult to obtain nice photographs of short-haired cats, probably because the owners of these less expensive pets do not think it is worth while to spend their money or to go to any trouble over having a good picture taken. As regards the coloured plates appearing in this work, care has been taken to instruct the artists to bring out as prominently as possible the special points of the cats, long- and short-haired. It is the first time that coloured plates of the different kinds of cats have been attempted; and it is hoped that, as types of each breed, these will prove useful to fanciers and instructive to the cat-loving public.

[Illustration:

THE HON. MRS. McLAREN MORRISON'S CATTERY AT KEPWICK.]

CHAPTER VIII. SOME NOTABLE CATTERIES.

Before entering upon a description of the various breeds, it may be interesting to my readers to give a short account, with illustrations (photographs for which have been specially taken for this chapter), of the catteries of some well-known fanciers who have not confined themselves to any special breed or variety.

Lady Decies' catteries, at her pretty summer residence at Birchington-on-Sea, are indeed most perfect in their arrangements, and every detail for the comfort and well-being of the inmates is considered. The stud cats have separate single houses, with good-sized wired-in runs, and luxurious and cosy sleeping apartments in the rear.

The main cattery is in a sheltered portion of the grounds, and will accommodate a large number of cats. The runs are arranged with boxes, benches, chairs, and ladders, and the sleeping places, built of brick, are most comfortably fitted up. By a system of wooden blinds the strong sea breezes and the bright rays of the summer sun can be regulated. There are side blinds and top blinds. The floors of the spacious catteries are wood, covered with cork carpet, and they are raised about a foot from the ground, so that there is a free current of air passing under the boards, thus securing absolute freedom from any damp.

In the house there are three rooms set apart by Lady Decies for her pussies. In two of these the queen mothers have their families, and the other is used as the cats' kitchen. The beds for the cats are specially designed by Lady Decies. The walls of the cats' rooms are adorned with pictures by Louis Wain, and there is a display of prize cards won by Lady Decies' famous cats. "Zaida," so well known as the winning silver female, is the privileged occupant of Lady Decies' boudoir, and here the aristocratic little lady makes herself at home on the soft cushions and couches.

The famous "Lord Southampton" is now in the possession of Lady Decies, and resides in one of the up-to-date catteries at Beresford Lodge. He was purchased at a very high price. Since his change of ownership he has not frequently appeared in public, but in the past he was a noted winner. It is, however, as a silver sire that he attained his success and made his name. It is well-nigh impossible to mention his numerous winning children. His name in a pedigree is a safe guarantee for quality and colour.

The two Siamese cats have warm quarters in the stable cottage.

Lady Decies' pets comprise both long- and short-haired cats. Among the latter "Xenophon" is generally considered as the best specimen of a brown tabby, and has a long prize-winning record. A woman and a boy are kept to attend to the wants of these aristocratic animals.

The Bishopsgate cattery may be said to have won a worldwide renown, and those who have been privileged to visit the ideal residence of Lady Marcus Beresford will agree with me that it is impossible to give any idea either by photography or description of the delightful dwelling places set apart for the pussies belonging to this true lover and fancier of the feline race.

There is the cat cottage, where the attendant has her rooms, and where the other apartments are especially fitted up for the cats. Here the Siamese have their quarters, and the sun streams in at the windows, which face due south. Opposite to the cottage, as may be seen in the illustration, are some of the cat houses, and in the centre is the kitchen. The cat attendant stands at the door, and some of the pussies are having their midday meal. The celebrated “Blue Boy II.” occupies a house, and in the background is a grass run, securely wired in, which is used as a playground for the pussies. In the hot summer weather this is shaded by the lovely spreading beech trees of Windsor Park.

The stud cats’ houses are splendidly arranged with sleeping places and nice large runs. The space in the centre in front of these runs is used as an exercise ground for the females and kittens. The garden-house cattery is, indeed, an ideal one, being a bower of roses in the summer-time, and in winter an ivy-clad retreat. This house is divided into two apartments, and these are generally used for the queen mothers and their families. On the shelves along the windows the pussies sit and sun themselves.

Truly the lives of inmates of the Bishopsgate catteries are spent in peace and plenty, and when their little span of life is over they find a resting place under the shadow of the grand old trees, and a little white tombstone with a loving inscription marks the spot of pussy’s last long sleep.

Lady Marcus Beresford has had almost every breed of cat under the sun at her catteries, but of recent years she has specially taken up silvers, blues, and Siamese, and a grand specimen of each of these varieties is in the stud at Bishopsgate. Amongst some of the celebrated cats owned by Lady Marcus Beresford I may mention “Lifeguard,” a grand orange of massive build; “Tachin” and “Cambodia,” two imported Siamese with perfect points; “Cora,” a tortoiseshell-and-white of great beauty, and “Kismet,” a brown tabby of exquisite shape, both imported; and “Cossy,” a smoke that has found a home in America. At the present time three of the most notable inmates of the Bishopsgate cattery, representing blues, silvers, and Siamese, are “Blue Boy II.,” “Beetle,” and “King of Siam.”

(_Photos: Cassell & Company, Limited._)

One of the largest catteries in Scotland, where the fancy grows apace, is owned by Mrs. Mackenzie Stewart, of Seagate House, Irvine. Mrs. Stewart has possessed several notable cats of different breeds. Her blue stud cat “Ronald” has made himself a name in the south of England as well as in the north. Mrs. Stewart has had silvers, creams, brown tabbies, and is now the owner of the celebrated black stud cat “Dick Fawe,” who has sired many winning kittens. The severe weather of this part of Scotland seems to suit these Persian cats, for a healthier, hardier set of pussies one could not wish to see than those disporting themselves in the pleasantly situated catteries of Seagate House. Mrs. Mackenzie Stewart is a most enthusiastic fancier, and often takes the long journey down South to bring her pets to the London shows. She has acted as judge in Scotland and England, and a contingent from the Seagate cattery is generally to be seen and admired at most of our large shows.

[Illustration:

A SLEEPING BOX IN LADY DECIES’ CATTERY.

(_Photo: Cassell & Company, Limited._)]

To old fanciers and exhibitors the name of Mrs. H. Warner is familiar. It was as Mrs. Warner, in 1889, that the Hon. Mrs. McLaren Morrison first exhibited a black cat called “Imp” at the Crystal Palace Show; and as black cats are said to bring luck, this puss took a first, and, thus encouraged, his owner commenced her “catty” career. In the following year, I note, by the catalogue, that Mrs. H. Warner had fourteen entries, and amongst these were two imported cats and the celebrated black Persian “Satan,” who departed this life in 1902. As late as 1897 this superb fellow, with glorious orange eyes, won everything he could (in spite of his age) at the Crystal Palace. There remains a worthy son of this worthy sire at the Kepwick cattery, named “Lucifer.”

[Illustration:

LADY DECIES VISITING HER PETS.

(_Photo: Cassell & Company, Limited._)]

It was in 1890 that Mrs. McLaren Morrison, then Mrs. H. Warner, made her name as an exhibitor of white Persians; for no less than six of this breed put in an appearance, and gained prizes at Sydenham. Mrs. McLaren Morrison writes:

“I have always been lucky with black cats, both long- and short-haired; but I especially love white Persians, and, in fact, at one time I owned a ‘white cattery.’ I may say I still have some good specimens—namely, ‘Musefer,’ ‘Queen of the Pearls,’ and ‘Lily.’ I love the imported cats, and always get them when I can. I have nine now at Kepwick. One of these hails from Patagonia and one from Afghanistan. My cattery at one time was twice again as full as now; but my losses have been great, and I have reduced the numbers so that I may give more attention to the young stock.

“It is only recently I have really gone in for orange Persians, encouraged by the wins of ‘Puck’ at the Botanical. I love this beautiful variety, but consider the queens of this breed very delicate. I have owned some fine blues at different times, and purchased for £25 a beautiful fellow, bred from ‘Beauty Boy,’ at the Crystal Palace many years ago; but, alas! he came home only to die. Foremost amongst my blues ranked my late Champion ‘Monarch,’ who held the Beresford Cup. Of late years I have taken up silvers. My first Chinchilla was Champion ‘Nizam,’ ancestor of such cats as ‘St. Anthony’ and ‘Ameer.’ I bought ‘Nizam’ at the Crystal Palace in the early days of silvers, and he only took second prize, because, I was assured, he was ‘too light’ for first. I have a few Russians. I am most devoted to my pussies, and have tried to persevere in breeding good stock in the face of very great difficulties. I do not much care about running the risk of showing, but a true fancier likes to support all well-arranged cat shows.”

[Illustration:

MRS. MACKENZIE STEWART’S CATTERY.]

Mrs. Collingwood, of Leighton Buzzard, is a most ardent lover of cats, but it is only of recent years that she has been before the public as a fancier and exhibitor. During this time, however, many have been the honours showered on the lucky inmates of the Bossington cattery.

Mrs. Collingwood has great difficulty, so she tells me, in keeping her number of cats down to about thirty! She likes these to be equally divided between long- and short-haired pussies; so there are all sorts and varieties. Blues have been great favourites, and Mrs. Collingwood is on the Blue Persian Cat Society Committee. “Royal Bobs,” a big, massive blue male, has done a lot of winning. He was bred by the Princess Victoria of Schleswig-Holstein. His sister “Jill” also inhabits one of the twelve cat houses distributed over five acres of the Bossington grounds. These smaller houses are mostly on wheels. The larger houses are kept for females and their families, and sometimes a corner of the hay-loft is set apart for a nursing mother. The male cats have their liberty during the morning, and then the females enjoy their afternoons out. Mrs. Collingwood does not keep a stud cat, but there are neuter pets that have their run about the house, and have their meals in a corner of the dining-room. Mrs. Collingwood intends going in strongly for smokes in the future; and although possessed of extremely good short-haired cats, this ambitious fancier is desirous of breeding a perfect silver tabby and a likewise equally perfect orange tabby. “James” is a beautiful specimen of a silver tabby, and during this year alone has won eight first prizes. At Altrincham he had the honour of claiming championship and silver medal for the best cat in the show, beating all the long-haired cats that generally carry off this coveted prize; and at the Crystal Palace he was the admired of all admirers, with a number of prize tickets covering his pen. I know many cat-loving people, but I do not think I have ever seen greater devotion shown to the feline race than is displayed at Bossington. Mrs. Collingwood is ever ready to support cat shows by entries, by guaranteeing classes, and by giving handsome prizes. Her cats are always shown in the pink of condition, and it is seldom they appear in the pens unless their devoted mistress is in attendance. Mrs. Collingwood kindly had the accompanying photographs specially taken for this chapter.

Perhaps no name is better known in the cat world than that of Mrs. Herring, of Lestock House, Lee, who has for nearly twenty years been a prominent fancier and breeder of both long- and short-haired cats. Mrs. Herring is a member of the National Cat Club Committee, and also belongs to several of the specialist clubs, and is a member of the Cat Club and the Northern Counties Cat Club. At all the principal shows this enthusiastic lady is a prominent figure, and in the quantity and quality of her exhibits she generally leads the way.

[Illustration:

THE IMITATION TREE, MRS. CLARKE'S CATTERY.

(_Photo: Mrs. S. F. Clarke._)]

At some of our large shows Mrs. Herring has entered from 25 to 30 cats; and I have known and seen these arrive with their mistress in a large omnibus or van. It is no light undertaking to prepare such a number of pussies for show, and then to convey them carefully to the place of exhibition.

Mrs. Herring started with a short-haired silver tabby called "Chin," and then turned her attention to long-haired brown tabbies; and although every variety of cat, both long- and short-haired, may be said to have existed from time to time in the Lestock catteries, yet it is with tabbies perhaps that Mrs. Herring has chiefly made her name and fame. Champion "Jimmy" was a superb specimen of a well-marked silver tabby, and he carried everything before him in the show pen. He passed away in 1900, and I do not think we shall see his like again.

Amongst many celebrities in the feline world which have been born or bred, or have found their habitation at the Lestock cattery, I may mention "King Saul," the noted tortoiseshell tom who still holds a unique position at our shows, and won the Coronation Cup at the Botanical show. "King Alfred," a long-haired silver tabby, and "King David," a massive blue, are also well-known winners of the present day. Mrs. Herring bred some sensational silver tabby long-haired kittens, and two of these—"The Duchess" and "Princess Lestock"—were exhibited respectively at the Westminster and Crystal Palace shows, and both were speedily claimed at the high catalogue price. "Floriana," a huge, handsome long-haired brown tabby, who formerly belonged to Mrs. Herring, has recently found a home in America. Siamese and Russian cats have not been strangers to this cattery, where sometimes the number of inmates has been over forty! Within the last few years Mrs. Herring has had to reduce her stock, owing to the complaints of neighbours, who showed no sympathy with the feline race, and some excellent, well-arranged cat houses had to be removed, as they somewhat encroached on a neighbouring garden wall. It must have been a trying time, and the weeding-out process a most difficult one, for such a really warm-hearted and devoted fancier as Mrs. Herring, whose pussies are all pets, and who personally supervises her cattery at Lestock House.

[Illustration:

MRS. CLARKE'S CATTERY.

(_Photo: Mrs. S. F. Clarke._)]

It is not given to all, particularly in large towns, to have at their disposal such an amount of waste space as their more fortunate brethren of the country. I have therefore asked Mrs. S. F. Clarke, whose cat photographs have been a delight to all our readers, to tell us how she manages in her town residence at Louth. Here are her notes.

BREEDING BLUE PERSIANS IN LIMITED SPACE.

"The successful breeding of blue Persian cats in a space so limited that a grass run or green trees are things to be desired rather than attained, requires nice judgment and great care. The space at my command for cat keeping and breeding purposes is only a back yard, some 14 yards long by 6 yards wide. This very limited space is further curtailed, on one side, by my husband's laboratory; while the cattery and its covered run cut off another strip at the end, of 7 yards by 2 yards, reducing the ground available for open air exercise and run to a patch about 18 feet by 12 feet, and a flagged portion some 21 feet by 6 feet.

"The space between the front of the laboratory and the flagged path being occupied by a small independent house and covered run, is very useful either for isolation or as a separate home for growing kittens. The boundary wall is supported by 4-foot wire netting supported by 3-foot iron stanchions, thus allowing a free edge at the top of about 12 inches to be bent _inwards_ and left _loose_. This I find a sufficient safeguard against my own cats getting out or strange cats getting in—a very important matter at all

times, but especially so at certain periods, if breeds are to be kept pure and pussy not allowed to make her own arrangements.

[Illustration:

THE HON. MRS. McLAREN MORRISON.

(_Photo: Esmé Collings, Hove._)]

“If I were asked for the very best design for building, fitting up, and furnishing a small cattery, I fear I could only answer that requirements differ so in individual cases that it is impossible to draw a hard-and-fast line that will meet all circumstances. Here is a photo of my own (p. 107). It is the outcome of my personal experience, and answers my requirements fairly well. It is a lean-to structure, about 7 yards long by 2 yards wide. The back and one end is formed by the north and west boundary walls, while the east end joins the dwelling-house, thus giving it a south aspect and complete shelter from north and east winds. It is divided into two unequal portions, the smaller (east) portion, 6 feet by 6 feet, forming the cat house proper; the longer portion is the covered run. The front of the house is built of 1-inch wood, with a lining of wood leaving an air space of about 3 inches between the outer and inner surface of the front and dividing partition. The roof is of corrugated iron, with a ceiling of wood about 4 inches below. This arrangement of double walls and roof secures reasonable warmth in the winter, but not quite sufficient coolness for mothers and kittens during the height of the summer. So the roof is then covered with a large white sheet hooked to the wall about 12 inches above the roof and carried over a rail in front about the same height, and there securely fastened. This arrangement insures not only a reasonable temperature, but also a never-ending source of exercise and amusement for both cats and kittens, some gambolling above, while others hide beneath the sheet. An ordinary sun blind along the front completes the summer arrangements. The front of the covered run is closed in with inch mesh wire netting from ground to roof, fitted on the inside with removable shutters, 18 inches high, and, above these, removable window-sashes, closing in as desired. These are held in place with turn-buttons, so they are easily removed or replaced in a couple of minutes, a great convenience in wet or changeable weather, and proving very cosy in the winter. The run is fitted with shelves for the cats to lie upon, a table, sleeping boxes, earth pans, two chairs, and an artificial tree covered with cork, which is a source of great pleasure when the cats are confined by bad weather to the run. The open run consists, as before mentioned, of a space about 18 feet by 12 feet; this is covered with gravel (which in such limited space should be renewed at least once a year), with the exception of a strip some 18 inches wide by 6 feet long on the west side, and two small corners on the east side, _reserved for grass_. This grass reserve, which is most important for the keeping of Persian cats in good health, is renovated every spring with fresh lawn seed, and should either of the patches suffer unduly from special attentions from the pets, it is wired in so as to protect it until it recovers. By this plan my cats secure a supply of grass all the year round. In the centre of the gravel space I have another artificial tree (_see_ photo), about 8 feet high; it is as great a favourite as the one in the run, and as it is hung with a loose cord, a few ping-pong balls, etc., it is a never-ending source of fun and frolic. To supplement the ground space, I place ladders leading to the tops of the roofs of the outbuildings and cattery, which afford extra space for exercise and a charming, interesting, and envious outlook for the cats into my neighbour’s garden. It is surprising how soon the kittens learn to climb up and enjoy the roofs.

“The sleeping house contains two wired-in runs going round two sides, about 2 feet by 12 feet long, containing nest-box, earth pan, etc. These are very useful for keeping a queen and litter of small kittens in. There are also two smaller wired-in runs, 2 feet by 6 feet, fitted like the larger ones, so that a cat may be shut up at any time if necessary. The queens sleep in the smaller runs in the winter. Beneath the runs a small cupboard is very useful for odds and ends of all kinds.

“In so limited a space cleanliness is of the utmost importance. The house and runs should be swept out, and the earth pans should be changed, washed, and disinfected _every day_. The question of supplying dust for the pans may prove a source of anxiety to the breeder confined to a limited space. In winter the dwelling-house fires supply about sufficient ashes daily; in summer I am compelled to fall back upon sawdust, which answers the purpose very well, only entailing a little extra litter in the runs and more grooming of the coats. Whatever the difficulty in this direction, it _must_ be overcome and the pans daily changed. The floors and shelves, both in cat house and covered run, should be washed with hot water containing some disinfectant at least once a week, and the wired-in runs for cats and kittens thoroughly done out with hot Sanitas distemper every time they are required for fresh occupants. All bedding should be changed at least once a week, and as little of it used as possible in summer. All plates, etc., used for food must be thoroughly washed after each meal.

“In a space such as I have described my cats have to be kept, for they are allowed into the dwelling-house by special invitation only; but they each receive this treat at least once during the day.

“As to the number of queens: _two_ or _three_ are ample where space is so limited. Where the fresh air run is a back yard, blues are the very best of all colours, as with a daily grooming they always look clean and presentable. In a space such as we are considering I would not on any account recommend the keeping of a stud cat. The want of necessary exercise would be cruelty to it; and the very limited surroundings unfair to those who might wish for his services.

“It is of imperative importance that the queens you commence with be of pure blue pedigree; if prize-winners so much the better, as their kittens will sell more readily.

[Illustration:

MRS. COLLINGWOOD AND “JAMES II.”

(_Photo: Alice Hughes, Gower Street._)]

“When mating, be sure that your queen is in perfect health, and do not mate her too young—in my opinion twelve months is young enough, in the interest of mother and family. See that the stud cat chosen be also of the best possible strain. That he be a noted prize-winner is of less importance than that he should be able to produce _kittens that will win_. He must have size, bone, strength, soundness of colour, length of coat, and good eyes. These are indispensable requirements if good blues are to be produced. He should especially be strong in those points where your queen may be somewhat weak; thus if the queen be deficient in length of coat or frill, or in colour, shape, or boldness of eye, see that the selected stud cat excels in those points, and so, as far as possible, correct and balance the points required between the parents. One must not expect to find perfection in any one cat. By using care, judgment, and forethought in mating our pets, we shall go a good way towards establishing in our strain the points necessary to build up the perfect blue Persian.

“All my kittens have been born in a Japanese dress basket, with the lid standing on its side and the bottom half thrust into it cradlewise. The outside of the basket proper is trimmed with a flounce, which helps to keep out draughts; over the top is thrown a small cloth table-cover, which covers, at will, the whole or part of the opening, thus making the little one’s house a pretty thing to look at. When any one of my queens is about to have a family I ‘flee-flea’ her, which I consider most essential for the future comfort of both mother and kittens; then I bring her into the house three or four days before the expected event. For the time being the expectant mother becomes the house cat. I let her find her own bed, which has already been prepared for her, by carefully closing all other places she might be likely otherwise to choose. When her time comes I stay with her during her trouble; but _never interfere_ unless it is absolutely necessary.

“A few encouraging words, and the fact that one is near, seems to give her comfort. If a queen shews much exhaustion, I give a little Brand’s Essence with a few drops of brandy in a spoon; but if all goes smoothly I let well alone. There is no need to press food upon the mother; she will not require it until some time after the births are complete. A little warm milk or gruel offered between the births may sometimes prove a comfort; but many queens will not touch it. For about three weeks, that is to say until the little ones creep out of their beds, I keep the queen and her family in the dwelling-house with me, changing her bed every other day. After the first week I make it a rule to handle the kittens at least once a day, and if the queen has more than three to bring up I begin, at two weeks old, feeding them three times a day with a few _drops_ of warm sweetened milk from a spoon, increasing the quantity very gradually as they grow. I never wake the kittens to feed them—sleep is as necessary as food; but always arrange to feed them just after the little ones wake; they are then hungry, and that is the best time to assist and relieve the mother. It is surprising how soon the kits enjoy being fed and look out for the friendly spoon.

“As soon as the little ones can get out of their bed they must be introduced to a shallow tin filled with ashes or earth. I prefer ashes to sawdust for very little kittens, and I find at a month old they will regularly use it. This early lesson in cleanliness is invaluable, as later on, with reasonable care, they never forget it. When the kittens are from three weeks to a month old I remove them, with the mother (or foster-mother), to their own little run in the cattery, where I visit them three or four times a day. When they grow stronger, and as early as the weather will permit, they are introduced to the open-air run, the sunshine, and the other cats.

“I begin the grooming as early as possible, daily brushing the little things in their bed or on my lap; it improves the fur, and the more they are groomed the sooner they get to like and enjoy it. When grooming kittens two or three months old, I generally have three or four trying to get under the brush at the same time, endeavouring to push the favoured one out of the way. I am strongly of opinion that the frequent handling of kittens does not do them any harm, but does tend to improve their temper and increase their gentleness. When I have callers the kittens are invariably fetched, introduced to, and fondled by the visitors, so that they become

not the least afraid of strangers; as a result, when they go to new homes they come out of their basket without fear, making themselves immediately at home, much to the comfort of themselves and their new owners.

“The best time to dispose of kittens is at about eight weeks old. Breeders with limited space _must_ sell young and quickly, keeping only the one or two of the season they may either wish to show or turn into next year’s brood queens. To get overcrowded is to court disease and disappointment, so sell early for the best price you can get; but sell you must, even if the price does not seem anything approaching the true value of the kittens. The first loss will be the known loss—most certainly far less than that involved in the risk of keeping one or two more kittens than your space should accommodate.”

BLACK PERSIAN “JOHNNIE FAWE” OWNED BY DR. ROPER.

(_Photo: Lavender, Bromley._)]

CHAPTER IX. BLACK PERSIANS.

Never have these truly handsome cats received the amount of admiration and attention which they deserve. There are fewer breeders of black Persians than of any other variety, the two most noted fanciers being Dr. Roper and Mr. Robert Little. Both of these gentlemen have owned and exhibited very handsome specimens; Miss Kirkpatrick has also bred some lovely black kittens. The entries in the black classes at our shows are almost invariably the smallest; but as a specialist club for black-and-white Persians has been started, it is hoped more encouragement will be given to the breeders of these handsome self-coloured cats.

As in the other self-coloured cats, the chief point is absolute uniformity of colour throughout. It is fatal for a black cat to have a brown, rusty tinge; it should be a glossy jet black, betraying no bands or bars in the full light, and having no under-coat of a lighter shade, and, above all, no spot or tuft of white hairs on the throat. This latter is a very common fault amongst black cats, and it is one which takes away enormously from the value of the specimen, for either show or breeding purposes. In some other varieties of Persian cats two, or even three, colours for eyes are permissible; but a really good black cat must have the full round eyes of deep orange, and very attractive are these gleaming orbs, shining forth from their dense black surroundings. When black cats are changing their coats they often present a very rusty appearance, and newly born kittens are sometimes like balls of brown fluff. These, however, frequently grow up the very best-coloured blacks. This breed is very strong and healthy, and often grow into large, massive cats. A tortoiseshell female is a splendid mate for a black male, and some of the most noted blacks have been bred in this way. Two brown tabbies will generally produce one, if not more, good blacks in a litter.

Black cats have been found very useful to breeders of silver tabbies and smokes for this reason—that these two breeds require to have their markings and colourings intensified. That is, a silver tabby with dark grey markings is not a true type, and a smoke with an upper coat of cinder colour does not represent the true smoke. Therefore the introduction of a black cross is often a great advantage to these breeds. There is certainly not much demand for black kittens, and we never hear of very high prices being asked or given for these, or, indeed, for full-grown cats. But as “every dog has his day,” so, perhaps, there is a good time coming for blacks; and certainly beginners in the fancy might do worse than to provide themselves with a thoroughly good black queen, for, anyhow, in exhibiting the chance of honours is very much greater than when competing in classes in which there are so many entries, as in the case of blues and silvers.

For very obvious reasons black cats are the very best animals for those living in London or near large towns. They can never present a dirty appearance, and, therefore, in this particular they will always score over the whites, creams, and silvers. To keep their coats glossy and bright black cats should be well brushed and groomed. They will repay for this care and attention. Our American cousins call self-coloured cats “solid,” and as applied to blacks this is especially expressive, for a black should not have a suspicion of any other colour than a dense black. If, when the coat is blown apart, a shading of grey or blue is seen it is a great defect. The nose should be black, and the pads of the feet also.

[Illustration:

CHAMPION “MENELIK III.” (AMERICAN).

THE PROPERTY OF MRS. BOND, WASHINGTON.]

I do not remember having seen or heard of an imported Persian black cat. In an article on imported cats in _Our Cats_ the writer (whose name is not given) says:—“White cats with blue eyes are not often to be obtained from abroad, neither are the blacks warranted to possess the amber eyes voted correct by up-to-date cattists. I know of a black queen straight from the land of cats and the palace of the Shah himself; it had the most glorious emerald eyes it is possible to imagine—as different from the ordinary run of green as flaming amber is from faded yellow. This cat, a Persian among Persians, had a coat as black as the proverbial jet—perfectly black throughout—long and straight, of fine, silky texture, but not giving one the impression of massiveness that is such a prominent, feature of the type of imported cat. Moderate in size, slightly built, with an expression so foreign that it amounted to weirdness, this cat could with a dash of imagination have been worked up into the incarnation of a spirit, a soothsayer, the veiled beauty of a harem, a witch, snake charmer—what you choose; but always remain something far apart from prosaic England, something tinged with romance and the picturesqueness of the mystical East. This black cat was undoubtedly a typical Persian.”

As there is such a dearth of good black cats in England, it is a pity some enterprising breeder does not try to import a really splendid specimen, which might bring luck to himself and the fancy.

In looking back to the old catalogues of Crystal Palace shows, I find the same scarcity of blacks exhibited as at the present day. In 1886 the black male class is marked “no entry,” and in 1889 Mrs. H. Warner (now the Hon. Mrs. McLaren Morrison) makes the sole and only entry of “Imp” in the black class. It was in the following year, however, that this same well-known lady fancier exhibited “Satan,” a black that was never beaten whilst it lived. It was the most remarkable of unapproachable excellence I can remember—a veritable triton among minnows.

In many of the accounts of our largest shows I remark such paragraphs as these: “Good blacks with orange eyes were conspicuous by their absence.” Or again: “The black classes, as usual, were poorly filled.” It is, therefore, high time that this beautiful breed should receive more attention at the hands of fanciers, and that not only beginners but those who are well known in the cat world should take up blacks, and, as the expression goes, “run them for all they are worth.” At present Dr. Roper’s and Mr. R. Little’s black Persians have it all their own way. Mrs. Lenty Collins frequently has a look in with her wonderful big-eyed “Forest Beauty,” and Mrs. Crowther, in the North, is faithful to this her favourite breed of cats; but we want some more dusky beauties to swell the ranks of black Persians.

As everyone knows, a vast deal of superstition is connected with a black cat. This is what Harrison Weir has to say on the subject:—“It is often said, ‘What’s in a name?’ The object, whatever it is, by any other would be the same; and yet there is much in a name. But this is not the question at issue, which is that of colour. Why should a _black_ cat be thought so widely different from all others by the foolish, unthinking, and ignorant? Why, simply on account of its colour being black, should it have ascribed to it a numberless variety of bad omens, besides having certain necromantic power? In Germany, for instance, black cats are kept away from children as omens of evil; and if a black cat appeared in the room of one lying ill, it was said to portend death. To meet a black cat in the twilight was held unlucky. In the ‘good old times’ a black cat was generally the only colour that was favoured by men reported to be wizards, and black cats were said to be the constant companions of witches; and in such horror and detestation were they then held that when the unfortunate creatures were ill-treated, drowned, or even burned, very frequently, we are told, their cats suffered martyrdom at the same time. It is possible that one of the reasons for such wild, savage superstition may have arisen from the fact of the larger amount of electricity to be found by friction in the coat of the black cat than of any other; experiments prove there is but very little either in that of the white or the red tabby cat. Be this as it may, still the fact remains that, for some reason or other, the black cat is held by the prejudiced ignorant as an animal most foul and detestable, and wonderful stories are related of their actions in the dead of the night during thunderstorms. Yet, as far as I can discover, there appears little difference either of temper or habit in the black cat distinct from that of any other colour, though it is maintained by many even to this day that black cats are far more vicious and spiteful, and of higher courage, and this last I admit. Still, when a black cat is enraged and its coat and tail are well ‘set up,’ its form distended, its round, bright, orange eye all aglow with anger, it certainly presents to even the most impartial observer, to say the least of it, a most ‘uncanny’ appearance. But, for all this, their admirers are by no means few; and, to my thinking, a jet-black cat, fine and glossy in fur and elegantly formed, certainly has its attractions.”

But although black cats are supposed to be harbingers of evil under some conditions, yet in others they are credited with miraculous healing powers. In Cornwall, sore eyes in children are said to be cured by passing the tail of a black cat nine times over the part affected; and in some parts of the country the presence in the house of a black cat is both an antidote and a cure for epilepsy.

[Illustration:

KITTEN BRED BY MISS KIRKPATRICK.

(_Photo: E. Landor, Ealing._)]

I think that most cat fanciers are inclined to believe in the possible luck that a stray black cat may bring them, and perhaps be more inclined to take in a stranger of this particular breed than one of another colour.

There is an old Scotch proverb that says:

“Whenever the cat o’ the house is black, The lasses o’ lovers will have no lack.”

The celebrated “Fawe” strain of black Persians is well known in the fancy. Dr. Roper has sent me some notes on his famous prize-winning cats, together with some useful information regarding the breed with which his name has become associated:—

“For many years black Persians were a most popular breed; but, like fashions, for the time being other colours, I regret to see, are obtaining more notice from fanciers. For years I plodded away to breed what I considered a perfect black Persian; at last my labours were crowned with success. What can equal a richly coloured, heavily coated, deep orange-eyed black?

“In breeding blacks, like any other colour, it is essential you should procure the best of stock, and be prepared to give a fair sum for such, otherwise you are almost sure to be disappointed in your results, and, maybe, retire as a fancier of this colour and try some other; but you will meet with the same fate if you hold the same views as to expense. A black Persian should be perfect in colour, with absence of white hairs, cobby in shape, short in leg, tail bushy and not too long, eyes large and deep orange, a good broad head, ears short with tufts and well set apart, short face, coat long and silky.

“Having stated the points, I will now give my experience of breeding.

[Illustration:

MRS. LITTLE’S BLACK PERSIAN “COLLEEN.”

(_Photo: D. Nottle, Beckenham._)]

“In my opinion, it is most important the sire should be a black, and one of his parents a black, whatever colour the queen is. I have had greatest success in breeding from a black sire and a tortoiseshell queen. Through this cross you may get either blacks or tortoiseshells. As an instance I quote ‘Johnnie Fawe’ (black) and Champion ‘Dainty Diana’ (tortoiseshell). From these I have bred many good blacks, amongst them ‘Dick Fawe,’ ‘Lady Victoria,’ and other good ones; also good tortoiseshells, three of them having taken championships. Blacks may also be bred from a black and a blue, or two blacks—in this case, cross the sire with one of his progeny, which I have found very successful. I admit there are other ways of breeding blacks, but in my experience the three ways I have suggested have proved to be the most satisfactory.

“In breeding, to be sure of success so far as the eyes are concerned, if possible it is better that both parents should have orange eyes, the deeper the better; but it is most essential the sire should have good orange eyes. Notwithstanding the queen’s eyes being light amber, by crossing with a good orange-eyed sire the kittens are very likely to have good-coloured eyes, but not _vice versâ_. As an instance, I once purchased a very handsome black queen, perfect in all points with the exception of the eyes, which were very light amber. I mated her to ‘Dick Fawe,’ who had the deepest orange eyes I have yet seen in a black; the kittens developed orange eyes. I have mated in the opposite way, and the result has been unsatisfactory so far as the eyes have been concerned, and if breeding for show the colour of the eyes is most important. The late Mr. Welburn, a well-known judge, once said in one of his reviews of blacks at a large show (I think it was the Crystal Palace), ‘I scarcely think that eyes alone should carry an award, yet it is always best to uphold the desired properties so hard to obtain.’

[Illustration:

THE CAROL SINGERS.

(_Photo: E. Landor, Ealing._)]

“Having bred a litter of black kittens, it is unwise to make up your mind what colour they are going to be until they have attained the age of six months. I remember once giving away a kitten at three months old which I called iron grey and thought would or could never be black. Six months after I saw my friend, who thanked me very much for the lovely black kitten. Two months after seeing him I saw the cat: there were no white hairs, and the colour was a perfect black. This last Richmond show I showed a black kitten, aged seven months; it took a first, a second, and a special. At three months old I thought it was going to be a smoke. It was claimed by the Hon. Mrs. McLaren Morrison. I have a kitten now, aged three months, perfectly bronze in colour and a grey frill. I have no doubt at seven months old it will be a perfect black. I have given these illustrations in order that those who are thinking of going in for blacks should not give up all hope of the kittens becoming black until the age I have stated.

“I breed my kittens from January to July, and find they do much better in the catteries, all of mine being separate; and I find Spratt’s movable runs most useful. In showing blocks they should be brushed and rubbed with a Selvyt cloth daily one month previously and kept free of matted hair. The application of Brilliantine or American Bay Rum in small quantity brushed on gives a perfect gloss to their coats.”

[Illustration:

BLACK-AND-WHITE PERSIAN CATS.]

CHAPTER X. WHITE PERSIANS.

A great change has taken place of late years in the quantity and quality of these beautiful cats, for whereas formerly blue eyes were considered quite a rarity, now it is seldom we see any yellow-eyed white cats exhibited at our principal shows. The most perfect type of a white Persian is assuredly to be found amongst the imported cats; there is a certain beauty of form and silkiness of fur which is not possessed by the specimens bred in this country. They are also generally distinguished by unusually long coats, round heads, tiny ears, and wonderful toe tufts.

[Illustration:

“JUNGFRAU,” SIRE AND GRANDSIRE OF MANY AMERICAN WINNERS.

(_Photo: W. F. Arnold, Oak Park, Ill._)]

One of the most lovely white imported cats was exhibited by Lady Marcus Beresford at the Westminster Cat Club Show in 1900. The best judges declared that there was not a fault to find with “Nourmahal,” but her career was a short one. These imported cats are often of a rather savage disposition, and, although they can be sweet-tempered enough with human beings, they are extremely fiery with their fellows. There are two points peculiar to white cats—they are frequently stone deaf, and they very often have odd-coloured eyes. Certainly the deafness is a drawback, and in selecting a white cat care should be taken to ascertain if the specimen is possessed of sound hearing. Needless to say, there are many ways of arriving at the solution of what is really a mysterious dispensation of Providence, for why should one particular breed of the feline race be so constantly minus this useful sense? Then, again, as regards the quaint arrangement of different-coloured eyes. One might not be so surprised if the eyes of white cats were sometimes pink, for their noses are pink, and the cushions of their feet, and, as in human beings, we might expect to have albinos amongst cats, namely white with pink eyes; but Harrison Weir states he has never seen pinkeyed whites, although it has been asserted that they exist. This peculiarity, however, of odd eyes seems only to be found in white cats, the two colours being blue and yellow. Occasionally white cats have wonderful seagreen eyes; and, although these are decidedly very uncommon, no colour is so completely in accord with the purity of the coat as eyes of heavenly blue. The tone should be not so much of a sapphire as of the deep forget-me-not blue. One of the drawbacks to white Persians is the difficulty of keeping them in spotlessly clean condition. This is absolutely impossible if they are living in or near a town, and certainly a white cat soiled is a white cat spoiled.

As regards the mating of blue-eyed white cats, I have been told by experienced breeders of this variety that kittens with blue eyes are just as frequently bred from odd-eyed parents, or, at least, when one of the parents has different-coloured eyes. It is easy to tell whether the baby blue eyes are likely to retain their colour or turn yellow. If at about three weeks or a month old the blue becomes

tinted with green, then surely but sadly may we make up our minds that these kittens have not a distinguished career before them, for they will see and be seen with yellow eyes. It is a pity to try mating white cats with any other variety, as broken-coloured cats will probably be the result. It frequently happens that white kittens, when quite young, have smudges of grey on their heads; these gradually disappear. In America white cats seem prime favourites, and the demand exceeds the supply for importation of white Persians with blue eyes. At the last Beresford Cat Club Show the entries in the white classes were very large. The classification included and provided for golden and blue-eyed whites, and these were subdivided according to sex, and all the classes were well filled. Mrs. Clinton Locke's "Lord Gwynne" is a noted white stud cat on the other side of the water, as is also Mrs. Colbourn's "Paris."

The devotees of the white cat in our own country are not many in number. I may mention Mrs. Finnie Young and Miss Hunt, who are perhaps the most successful breeders of whites in Scotland; and in the south we have Mrs. Pettit, whose tribe of blue-eyed whites I had recently the pleasure of seeing. No more lovely specimens could be imagined, and I counted more than a dozen long-coated, full-grown, bonnie blue-eyed beauties, walking about in the woods surrounding Mrs. Pettit's dwelling place near St. Leonards-on-Sea. The illustration shows Mrs. Pettit surrounded by eight of her pretty white pussies. Mrs. Westlake, Mrs. Nott, Miss White Atkins, and Miss Kerswill are all successful and enthusiastic breeders of white Persians.

[Illustration:

MRS. McLAREN's WHITE PERSIAN "LADYSMITH."

(_Photo: C. Reid Wishaw._)]

Several well-known fanciers keep one white cat amongst their flock. I may mention the Hon. Mrs. McLaren Morrison, the owner of "Musafer," a famous imported puss, and Lady Decies, the former possessor of "Powder Puff," who has recently been presented to H.H. Princess Victoria of Schleswig-Holstein. There is always a keen demand for white kittens, either as pretty pets or, if with correct coloured eyes, for breeding purposes, and, doubtless, when more encouragement is given to this beautiful variety, there will be an increase of fanciers of the white cat, whose praises have been sung in fairy tales, nursery rhymes, and by novelists who have a weakness for describing interiors with a beautiful white Persian cat reclining on the hearthrug.

[Illustration:

MRS. PETTIT WITH HER WHITE PERSIANS.

(_Photo: Cassell & Company, Limited._)]

I am indebted for the following notes on white Persians to Miss M. Hunt, whose beautiful white cat "Crystal" appeared on an earlier page, and by an unfortunate mistake was stated to be the property of Mrs. Finnie Young:—

"The blue-eyed white Persian is, I consider, one of the most interesting to breed, and, in my experience, no more delicate or difficult to rear than any other Persian.

"I have had them now for nearly four years, and, I think I may say, with a good deal of success. I bought 'Crystal' in 1898, when four months old, and she certainly has been a good investment. Out of the sixteen white kittens she has had, ten of them have been blue-eyed.

"The very best kitten I owned was never exhibited; he went to Mrs. Champion, who considered him the best and healthiest kitten for his age she had ever seen. Unfortunately, he died suddenly shortly after she had him. He was by Champion 'White Friar' _ex_ 'Crystal,' and was one of the same litter as 'Jovial Monk,' which did so much winning for Miss Ward, who purchased him from me at the Crystal Palace, where he took first. 'Crystal' herself has only once been beaten by a white cat, and that had not even blue eyes; but she was in splendid coat, and 'Crystal' was quite out of coat. Most judges are agreed, I think, that 'Crystal' is the best blue-eyed white female in the country.

"The colour of the eyes of white kits can be told much earlier than in any other colour; some I can tell as soon as they are open, others I am not quite sure of till they are about a fortnight old. The eyes are generally bright blue from the beginning, without a shade of kitten grey in them. I do not think that both parents having blue eyes makes much difference to the number of blue-eyed kits in the litter. If one parent is blue-eyed and the other odd-eyed the result is often just as good. I know of a green-eyed queen which had a litter of three by Champion 'White Friar'—all were blue-eyed.

“As to deafness, I cannot account for it at all, as it often appears, though both parents have perfect hearing.”

“Since Mrs. Finnie Young and I purchased ‘White Friar’ in 1900, whites have become much more plentiful in Scotland, and the competition is now very keen indeed up North. ‘White Friar’ has had a very successful career since he came into our hands, both as sire and on the show bench, and can still hold his own against all comers. He has won sixteen first prizes since 1900, besides championships and numerous specials.”

Mrs. Champion, whose name is well known in “catty” circles, and who has now left these shores for America, did a great deal to establish a thoroughly good strain of white blue-eyed Persians. Her celebrated “White Friar” (now in the possession of Mrs. Finnie Young and Miss Hunt) is justly considered the finest male specimen in the fancy. Certainly he could only have been beaten by his son “White Tsar,” bred by Mrs. Champion from her “White Witch.” This cat, which assuredly would have had a notable career, was sold by Mrs. Champion for £20 to Mrs. Colbourn, in America. He arrived in poor condition and died shortly afterwards. I remember seeing an absolutely perfect white Persian kitten at Mrs. Champion’s. It was by “White Friar” ex “Crystal.” He had startling deep blue eyes, tiny ears, and broad, round head, and at nine weeks old his coat measured nearly three inches across. Alas! though healthy and strong, this proved too perfect a specimen for this world, and “Crystal Friar” succumbed to the epidemic of gastritis then raging amongst our feline pets. Referring back to celebrated white Persian cats of the past, I well recollect the marvellous size and splendid coat of Mrs. Lee’s “Masher,” who took the cat world by storm when exhibited at the Crystal Palace in 1890. This enthusiastic fancier paid £21 for “Masher,” whose show career was shortened by an accident. This cat was remarkable in those days, if only for his grand blue eyes.

[Illustration:

“CRYSTAL.”

THE PROPERTY OF MISS M. HUNT.

(_Photo: C. Reid, Wishaw._)]

The well-known breeder and judge Mr. A. A. Clarke, whose name is more closely connected with blue Persians, once owned a famous female called “Miss Whitey.” I remember that this really remarkable cat was exhibited in 1887 at the Crystal Palace, and again in the following year, when at four years old she took first prize and silver medal in a strong class of nine females. It seems to me that these cats, as I recollect them, appeared half as large again as the present-day champion winning whites; but whether this was in consequence of more profuse coat or a generally bigger build of animal I cannot at this distance of time pretend to determine.

Amongst the well-known prize-winners and stud white Persian cats of the present day I may mention Miss White Atkin’s massive-limbed “White Knight,” whose broad skull is especially remarkable in a show pen, and commends itself to the notice of the judge. Miss Harper’s “Blue-eyed Wanderer” has great quality and lovely texture of coat. He was in truth a wanderer in the streets of a London suburb, and, although labelled “breeder and pedigree unknown,” he has almost always held his own in the white classes at our largest shows. Mrs. Westlake, Mrs. Pettit, Mrs. Finnie, and Miss Hunt are all possessed of imported white cats, which have proved worthy ancestors of many prize-winning kittens. There have not been any very notable female white cats exhibited since the appearance of Lady Marcus Beresford’s “Nourmahal,” with the exception of Miss M. Hunt’s “Crystal” and Mrs. Pettit’s most lovely “Piquante Pearl,” bred by her from her stud cat “King of the Pearls” and “Beautiful Pearl.” This cat is as near perfection as possible, and has carried off highest honours whenever exhibited. Mrs. Pettit began breeding white Persians in 1896, and has kept faithful to this breed ever since. This enthusiastic breeder always accompanies her exhibits, and her precious Pearls are never seen at the smaller mixed shows. I have always heard that white kittens are difficult to rear, and Mrs. Pettit, who should be well qualified to give her testimony on this point, says: “Without a doubt blue-eyed white Persians are the most delicate cats in existence.” A well-known authority on cats, writing to one of the cat papers, says: “What a change has taken place in our white classes, long- and short-haired! A few years ago white cats with green or yellow eyes frequently were prize-winners, and a blue-eyed white was looked upon as a rarity. Now blue eyes have it all their own way, and judges are becoming more and more exacting as to the depth of tone and quality of the blue tint. If we could obtain a white Persian with the glorious eye of the Siamese, it would be a treasure indeed.”

A gentleman who has lived for ten years in Assam says that he never saw in that part of India any long-haired cats except blue-eyed whites. He also gives an amusing account of the usual way of obtaining a cat of this variety for a pet. It is as

follows:—“You give instructions to a native, who offers to procure you one at a certain price, but gives you no idea where or how he means to procure it. In about a week’s time he appears with the cat and claims the money. Things progress favourably with your new possession for a time, but suddenly and unaccountably your puss disappears. You are calling on some friend or acquaintance, and, to your surprise and astonishment, there on the armchair lies, curled up, your cat! Thus it will be seen that the wily native makes a small income out of one cat, by stealing or enticing it away from the original purchaser and calmly re-selling it to one of the neighbours.”

Mrs. Clinton Locke, the president of the Beresford Cat Club, has owned some beautiful white Persians which she has imported from time to time. This lady writes thus to _Our Cats_:—“The first white Persian I ever owned was brought to me many years ago from Persia by a distinguished traveller, and its eyes were amber, showing that the white cats brought from their native land have not always blue eyes. The descendants of this cat, mated to both amber and blue-eyed cats, have thrown blue eyes. Two odd-eyed cats have also given blue-eyed kittens; but a pair of blue-eyed cats has by no means always thrown blue eyes with every kitten in the litter.”

“WHITE BUTTERFLY.”

THE PROPERTY OF MISS WHITE ATKINS.

(_Photo: E. E. Lipputt, Leamington._)]

One of our most persistent and consistent breeders and fanciers of white Persians is Mrs. Westlake, and therefore I am glad to be able to put forward a few of her experiences as to the peculiarities of the breed.

Mrs. Westlake, writing from Camden Town, says:—

“My acquaintance with white Persian cats began some years ago, when I imported a white female as a pet. I was so delighted with her that, although for a London resident white cats would seem the least desirable, I decided to import two blue-eyed whites for breeding purposes. It was a litter from these two cats that tempted me to take up exhibiting. This litter consisted of _all_ blue-eyed kittens, the tone of the blue being exceptionally deep. Since then I have, of course, often had a different tale to tell, and odd-eyed kittens have sometimes predominated. This curious freak of nature connected with white cats seems unaccountable. The two colours are generally yellow and blue, but I have seen green and blue. I have also remarked on the very brilliant tone of the one blue eye.

“There is a popular belief that almost all blue-eyed cats are deaf. All I can say is that I have never had a blue-eyed white that was deaf. I have, however, often come across those that were stone deaf, and others with defective hearing. Again an unaccountable freak.

“White Persian cats have been declared to be the most difficult to breed and delicate to rear. My opinion is that the delicacy is much more in their coats than their constitutions; that is, of course, in comparison with other foreign varieties, none of which are as hardy as the British.

[Illustration:

IMPORTED BLUE-EYED TOM, “MUSAFER.”

(_Photo: V. R. Clarke, Thirsk._)]

“A few remarks as to the cleansing of white cats may be useful. As a dweller in London, I need scarcely say that unless I occasionally gave personal attention to my pussies they would not always be in the show condition that I would desire. Some fanciers wash their white Persians, but I have come to the conclusion that this treatment tends to coarsen the soft silkiness of the fur; and therefore, for this reason, and also because there is a risk of cats catching cold, especially in winter, I advocate dry cleaning, and suggest the use of Pears’ white precipitated fuller’s earth. One plan is to place the cat on a large sheet or towel, mix a little ammonia in warm water, dip your hands in this, and pass them over and over the fur, letting it become thoroughly moistened but not wet. Then well sprinkle the coat with the powder, and by keeping the animal in front of the fire the fur will soon become quite dry. Then rub with a soft towel, and finally brush thoroughly with a clean and not too hard brush. Your efforts will be rewarded with success, and though puss may be considerably bored during the process, she will not resent it so much as a tubbing. I find that

white females are far more diligent as regards their toilet than the males, who seem always to have more of the Eastern languor and indolence in their nature. I have remarked—and no doubt it is more noticeable in the white breed—that as soon as young kittens are beyond their mother's control they exhibit a marked antipathy to keeping their coats in anything like decent condition. Sometimes they will make a feeble attempt at washing themselves; but something will excite their attention, and off they will go, or perhaps in sheer fatigue will fall asleep during the toilet. Thus white kittens will very soon present a most unkempt appearance, and the poor mother gazes sadly at them as though the cares of a family were too much for her, and she no longer wishes to own what was once her pride and joy—a spotless litter!

"It has been stated that white cats are wanting in expression, probably because of the lack of markings to give character to the face; but breeders of whites will nevertheless agree with me that they have even greater force of expression, not being assisted by any markings. I have found white cats to be most affectionate, and very conservative in their tastes. I have owned some white Persians with light seagreen eyes, and although these are not correct, yet I must say they were strikingly beautiful and very uncommon. I have been offered high prices by Americans and others for my imported white female, but my 'blue-eyed darling' will, I think, end her days with her devoted mistress in dear, dirty, old London."

CHAPTER XI. BLUE PERSIANS.

A famous publisher once gave the following advice to a young author: "Never take it for granted that your readers have any previous knowledge of your subject, but credit them with ordinary intelligence." To all feline fanciers the heading of this chapter is a familiar household term, but to novices in the cat world and to outsiders the term "blue" as applied to a cat may sound rather absurd. Truth to tell, the name is misleading, and yet the same is used in describing certain breeds of domestic animals, such as dogs, rabbits, etc. There is also a fur much used for trimmings of ladies' jackets, etc., called blue fox, and this is very much akin to the colour and texture of the fur of the blue Persian cat, which, however, varies in tone from a dark slate to a pale lilac-blue.

[Illustration:

JACK AND

(_Photo: H. Warschkarski, St. Leonards-on-Sea._)]

It is over twenty years ago since I exhibited the first "blues" at the Crystal Palace Cat Show, and they created quite a sensation, for no one seemed to have seen any cats of this peculiar shade before. Some called them grey or lilac, and others London smoke or slate colour. One of my pair of blue kittens was quickly claimed at catalogue price, and I brought in the other, fearing I should lose her also. She, in her turn, became the mother of many celebrated blues. In those early days of the fancy blue Persians were entered in the "any other variety" class, and most of the specimens exhibited were in reality blue tabbies. For some years this state of things continued; but Mr. A. A. Clarke, so well known as one of the pioneers of the National Cat Club, and as a breeder, exhibitor, and judge, agitated with other fanciers, myself amongst the number, to obtain a better classification for the self-coloured blues, and in 1889 the schedule at the Crystal Palace Show contained a class for "Blue—self-coloured without white." For some time this breed of cats was termed "self blues," in contradistinction to the many blues with tabby markings which were formerly so very common in the fancy.

In 1890 it was decided to divide the sexes in the blue cat classes, and let the kittens compete with black-and-white. The result was an entry of eight in each class, my famous "Beauty Boy" taking first in the male, and Mrs. H. B. Thompson's celebrated "Winks" first in the female division. At Brighton in the same year the "self-blue" class was adopted with success.

[Illustration:

JILL.

THE PROPERTY OF MISS BENNETT.

(_Photo: H. Warschkarski, St. Leonards-on-Sea._)]

The famous blue stud cats of that period were Mr. A. A. Clarke's "Turco," Miss Bray's "Glaucus," and my own "Beauty Boy." Amongst other exhibitors of blues about this time I may mention Mrs. Warner (now the Hon. Mrs. McLaren Morrison), Mrs. Vallance, Mrs. Wells, Mrs. Hunt, Mrs. H. B. Thompson, Mrs. Ellerton, and Miss F. Moore. In 1891 blues came very much to the fore, and the entries at the Crystal Palace numbered 15 males and 17 females. At Cruft's Show in the year 1894 a grand blue, called

“Wooloomooloo,” was exhibited by Mrs. W. R. Hawkins, and this cat became one of the most famous of stud cats. Many of the finest blues of to-day are descended from this noted sire. Mrs. H. B. Thompson’s “Don Juan” was for many years greatly in request as a stud cat, and many beautiful blues claim him as their ancestor.

A little later “Moko” became famous as the sire of a sensational kitten exhibited by Mr. C. W. Witt at the Westminster Show of 1900. “Moko” was sold at a high figure to Mrs. Barnett, and is now in the possession of Mrs. Singleton, of Yeovil. Mr. A. A. Clarke was considered the best judge of this variety, and at the Palace and Brighton he did much to encourage the breed by offering handsome special prizes in the blue classes.

It is true that the prize-winning cats of ten and fifteen years ago would have had but a poor chance in the present-day competitions, chiefly for the reason that cats of the past could look at a judge with bright green eyes and yet be awarded the highest honours. _Nous avons changé tout cela_, and now a blue cat without the much to-be-desired orange eyes fetches but a small price, and is at a great disadvantage in the show pen. An up-to-date judge may, however, be led into giving too great a prominence to this point and thus sacrifice soundness of colour, shape, and form. Then, again, I remember when a white spot on the throat of a blue Persian was not considered a serious defect; now a few straggling white hairs will cause anguish to the owner, and a judge will promptly put down the specimen for this blemish.

Blue cats with white spots used to be relegated to the “any other colour” class; but recently both the National Cat Club and the Cat Club have wisely decided that such cats should be judged in their own classes. However, I think that owners of these specimens would do well to keep them away from the show bench, where the competition in blues is now too keen to give any chance for defective cats to have a look in. I may mention that the nose of a blue Persian is a few shades darker than its fur, and the toe-pads yet a little darker.

As will be seen from the standard of points for blues, which will be found later on in this chapter, the highest marks are given for soundness of colour. There is a tendency to breed very light blues, and popular fancy favours this particular type. I am inclined, however, to prefer a good sound medium blue as being the best and safest for breeding purposes. The lovely pale blues are beautiful to look at, but are seldom absolutely sound in colour. Blues, whether dark or light, should be the same tint throughout, so that when the coat is blown apart the colour at the roots is the same as at the tips. A white under-coat is a serious blemish, and this often appears when silver blood may be traced in the ancestry of a blue cat. We have quite dropped the term of self-blue, and yet this well expresses the uniformity of colour which is so desirable. As tiny kittens blues frequently exhibit tabby markings; but fanciers need not worry over these apparent defects, for as the coat grows the bars and stripes are no longer visible.

It also sometimes happens that a kitten exhibits quite a light ruff, but this is generally shed with the second coat, and eventually disappears. There are some cats erroneously called blues by novices in the fancy, but which in reality are blue smokes. These have probably been bred from blues and smokes, and thus the type of each is seriously damaged. If it is desired to breed sound-coloured blues, then it is undesirable to cross them with any other colour save and except blacks. I have found good results from mating blues and blacks, more especially with a view to obtaining the deep amber eyes of the black Persians, which, for some reason or other, are generally larger, rounder, and deeper in colour than what we can produce in blues. Certainly all broken breeds and tabbies should be avoided when mating blues. I have heard of white cats being bred with blues to get a pale tint of blue; but white toes, chests, and spots have often been the results of such experiments. I have bred blue Persians ever since I took up the fancy, which is longer ago than I care to remember, and I have found them strong and hardy cats, requiring no special food, and enjoying the best of health without any cosseting or coddling. I do not consider that blues usually obtain any great size or weight, nor are they generally massive in build or profuse in coat.

[Illustration:

BLUE AND CREAM PERSIANS.

(_From a Painting by W. Luker, Jun._)]

Ten or fifteen years ago I used to have my blue kittens bespoken for about £5 each before they were born; but nowadays, when blues are so plentiful, one must be content with lower prices, and the average sum for a good blue kitten is three guineas. Still, I am sure that for beginners in the fancy, wishing to combine pleasure and profit, there is no better investment than a good sound blue queen with orange eyes. The demand for blue kittens is really larger than for youngsters of any other breed. They make superb pets, but it is to be regretted that blue neuters are generally spoilt with green eyes, doubtless for the reason that the possession of

good orange eyes tempts the owner or purchaser to reserve the specimen for stud or breeding purposes.

As one of the first breeders and exhibitors of blue Persians I feel I am in a position to speak with authority, and I am of opinion that no breed has made such rapid strides, either in improvements or popularity, as blues. In this statement I am supported by our best professional judge, Mr. T. B. Mason, who, writing to me on the subject, says: “I find ten good blues at the present time to one we came across two or three years ago. I am of opinion that in no colour of cats have we seen more distinct progress than we see in blue Persians.” Such a statement, coming from our most able and ubiquitous judge, is a valuable one. Mr. Mason has had a large experience in cat judging during the last few years, and his duties take him north and south, east and west.

As regards the breeding of blues, I consider that to obtain the true sound colour blues should only be bred to blues.

I have often, however, observed that a kitten of unsound colour is to be found in litters bred from two sound-coloured blues; the kitten may have a white under-coat or be full of white hairs, or have a shaded ruff; but experienced breeders will soon discover that such blemishes are but temporary, and that the ugly duckling of a family may develop into the flower of the flock. It is, therefore, very interesting to make experiments and to keep an apparently worthless specimen to see what it turns into when the first months of infancy are passed and the kitten coat has been shed.

I have known a young blue of sound colour completely transformed in this particular by a severe illness. Her fur became a sort of pepper-and-salt mixture—a sprinkling of white and dark grey; but this same cat, contrary to the prophecy of an able judge, has again changed her coat, and is now a perfectly sound blue, even from tip to root. It was evident that her illness had affected her coat, and that when she regained her usual health she recovered her correct coat. As regards the eyes in blues, it is not possible to give any exact time for the change in colour from the baby blue to the dreaded green or hoped-for orange. This change takes place gradually, and sometimes the period extends till a kitten is almost a cat. There are many blue cats with what may be called indefinitely coloured eyes; that is, neither orange, nor yellow, nor green. This most unsatisfactory state of things may be generally accounted for by a circle of green round the pupil, which, according to the time of day, will be wide or narrow. Thus it is that cats with this defect are sometimes described with “good yellow eyes,” and advertised as such, and then, when received by the purchaser, a glint of green is plainly visible in the inner circle. The perfect eye in a blue should be absolutely unshaded; and there are two distinct types of eyes, namely, the golden eye and the orange eye. The former resembles a golden coin in tint, and the latter has the dash of red which is to be seen in copper. Both these coloured eyes are correct, and much to be admired in blue Persians, and no doubt as time goes on we shall find it will be the rule and not the exception to see these perfect eyes amongst the blues of the future. It must, however, be borne in mind that in the point of eyes cats throw back, and two parents with good orange eyes may yet produce one or more kittens with pale eyes of yellow or greenish hue. Although I have dilated at length on the superiority of the orange eye in blues, I do not wish it to be thought that a weedy, boneless cat, even with eyes of deepest hue, would find favour in my sight; for in blues, as in all breeds of Persians, what we ought to seek after most earnestly are good massive limbs, plenty of bone, and broad skulls. There are too many Persian cats of hare-like proportions, and we really want some of the type of a good old English tabby introduced into the more aristocratic long-haired breeds.

[Illustration:

THE ARTIST.

(_Photo: Mrs. S. F. Clarke._)]

It will be interesting to up-to-date breeders of blues to hear what the veteran cat lover and fancier Harrison Weir had to say about them fifteen years ago. In his well-known book, “_Our Cats_,” he thus alludes to the breed:—

“Blue in cats is one of the most extraordinary colours of any, for the reason that it is a mixture of black (which is no colour) and white (which is no colour), and this is the more curious because black mated with white generally produces either one colour or the other, or breaks black-and-white or white and black; the blue being, as it were, a weakened black or a withdrawal by white of some, if not all, of the brown or red, varying in tint according to the colour of the black from which it was bred, dark grey, or from weakness in the stamina of the litter. When once the colour or break from the black is acquired, it is then easy to go on multiplying the different shades and varieties of tint and tone, from the dark blue-black to the very light, almost white grey. If whole-coloured blues are in request, then parti-colours, such as white and black, or black and white, are best excluded.”

Many of our leading cat fanciers “go in” exclusively for blues, and keep faithful to this one breed alone. I give a list of these, and trust I may be pardoned if I have left out the name of any enthusiastic breeder and lover of blues and blues alone: Mrs. Hill, Mrs.

Wells, Mrs. P. Hardy, Mrs. H. Ransome, Mrs. Bennet, Mrs. Mocatta, Mrs. S. F. Clarke (Louth), Mrs. Cartwright, Mrs. Gregory (Lincoln), Mrs. H. B. Thompson, Mrs. O'Brien Clarke, Miss Jay, Miss Bennet, Miss Messer, Miss Patterson, Miss Goddard, Rev. P. L. Cosway, Mrs. Swanson, Mrs. Curwen, Mrs. Duffin, Mrs. W. M. Hunt, Mrs. Slingsby, Mrs. Singleton, Miss Savery, Mrs. Eustace, Mrs. Hitchcock, Miss Hooper, Miss Violet Hunt, Miss Humfrey, Mrs. Kennaway, Mr. H. Maxwell, Mrs. Ponder, Miss Rigby, and Mr. C. W. Witt.

[Illustration:

BLUE KITTENS BRED BY MISS KIRKPATRICK.

(_Photo: E. Landor, Ealing._)]

There are, of course, a large number of fanciers who, amongst other breeds of cats, keep one or two blues, and several keep blues and silvers only. I think I may safely say that blue Persians have the largest number of admirers, and certain it is that at all our large shows the blue classes are the best filled. At the Cat Club Show held at Westminster in 1899 the number of entries in the blue female class was a record one—there were no less than 48, and the blue males mustered 42.

Seeing, therefore, how popular this breed had become, in April, 1901, I founded and started the Blue Persian Cat Society, a book of rules was drawn up, and the following ladies and gentlemen appointed as officials of the society:—

BLUE PERSIAN CAT SOCIETY.

Founded April 24th, 1901.

Presidents: Viscountess Maitland, Mrs. Maconochie, Miss Gertrude Jay.

Vice-Presidents: Viscountess Gort, Lady Danvers, the Hon. Mrs. Maclaren Morrison, Mrs. Collingwood, Mrs. W. M. Hunt, Miss Violet Hunt, Mrs. Clinton Locke, Mrs. Lionel Marks, Mrs. Herbert Ransome, Mrs. Mackenzie Stewart, Mrs. H. B. Thompson, Mrs. Woodcock, Sir H. Jerningham, K.C.M.G., Sir B. Simpson, K.C.M.G., Rev. P. L. Cosway, Frankfort Moore, Esq., R. Storks, Esq.

Committee: Mrs. Baldwin, Mrs. Russell Biggs, Mrs. Bishop, Mrs. P. Brown, Mrs. P. Hardy, Mrs. Collingwood, Mrs. H. L. Mocatta, Miss H. Patterson, Mr. Gambier Bolton.

Hon. Treasurer: Mr. Russell Biggs, 1, Garden Court, Temple.

Hon. Secretary: Miss F. Simpson, 9, Leonard Place, Kensington, W.

Judges: Lady Marcus Beresford, Mrs. P. Hardy, Mrs. W. M. Hunt, Miss G. Jay, Miss K. Sangster, Miss F. Simpson, Mr. C. A. House, Mr. T. B. Mason, Mr. F. Norris, Mrs. Mackenzie Stewart, Miss E. Goddard, and Miss Kirkpatrick.

[Illustration:

MRS. ROBINSON'S BLUE KITTENS.

(_Photo: J. Joyner, Cheltenham._)]

The chief objects of this society are as follow:—To promote the breeding and exhibiting of blue Persian cats; to define precisely, and to publish a description of, the true type of blue Persian cat, and to urge the adoption of such type on breeders, exhibitors, and judges, as the only recognised and unvarying standard by which blue Persian cats should be judged; the improvement of the classification, and, if necessary, the guaranteeing of classes for these cats at shows supported by the society; the selection of specialist judges to make the awards at such shows. The annual subscription to the Blue Persian Cat Society is five shillings, payable by each member on election. At the general meeting of the society, held in April, 1902, the number of members on the books was 183, and the honorary secretary reported that during the past year twelve cat shows had received the support of the society, and numerous handsome challenge prizes, badges, and specials had been offered for competition.

[Illustration:

MRS. WELLS' CATTERY.

(_Photo: Cassell & Company, Limited._)]

The following is the standard of points drawn up by the committee of the Blue Persian Cat Society and approved of by the members of the society:—

STANDARD OF POINTS FOR BLUE PERSIAN CAT.

Coat (30).—Any shade of blue allowable; sound and even in colour; free from markings, shadings, or any white hairs. Fur long, thick, and soft in texture. Frill full.

Head (25).—Broad and round, with width between the ears. Face and nose short. Ears small and tufted. Cheeks well developed.

Eyes (20).—Orange; large, round, and full.

Body (15).—Cobby, and low on the legs.

Tail (10).—Short and full, not tapering.

Members should not be deterred from showing their cats if they do not come up to the high standard set forth in the above definition.

It is true that very few, if any, blue Persians come up to the high standard here given, but still there is a very marked improvement in the breed during the last year or two. The number of green-eyed blues are steadily and surely decreasing, and the colour of the coat and size of head are points that have been carefully attended to. In reading the list of blue cats placed at stud in the columns of the cat papers we cannot help being impressed with the enormous strides made of recent years in this breed of cats alone. In a recent copy of _Our Cats_ I counted twenty-five stud advertisements of blues, and this does not nearly represent the entire number of blues used for stud purposes by fanciers. This breed of Persians has become very popular in America, and several fine cats have been exported, and have carried off the highest honours at the New York Cat shows, held under the auspices of the Beresford Cat Club.

Mrs. Clinton Locke, the president of the club, is an enthusiastic breeder and admirer of blues, and has possessed the finest specimens among American fanciers.

The names of two good “all-round” judges appear on the blue Persian list, namely, Mr. C. A. House and Mr. T. B. Mason, and exhibitors of this special breed—as, indeed, of any other—may feel quite sure that their precious pets will receive justice at the hands of these two careful adjudicators.

Mr. E. Welburn, also a blue Persian judge, was long known and respected in the fancy, and his death in 1902 was a great loss to the cat world. Two silver bowls have been subscribed for by his many admirers in memory of this upright judge, and these are competed for annually at the two largest shows of the National Cat Club and the Cat Club.

[Illustration:

“ROKELES KISSI.”

BRED BY MRS. BENNET.

(_Photo: H. Warschkowski, St. Leonards-on-Sea._)]

Miss Jay and Miss Frances Simpson have frequently given their services as judges at some of the shows which have received the patronage of the Blue Persian Cat Society.

In conclusion, I would say that I am very hopeful of being able at some future time to hold a show for blue Persians, and by dividing and subdividing to give an attractive and liberal classification.

I have pleasure in giving a short account, with illustrations, of some of the catteries belonging to blue breeders.

Mrs. Wells, of Isleworth, was one of the first exhibitors of blue Persians, and has been faithful to this breed for many years. She has wonderfully well-planned catteries, and, having plenty of space at her command, the cats are able to enjoy lots of liberty in large wired-in runs, planted with shrubs, and with an abundance of grass. Mrs. Wells’ blues are noted for their wonderfully fine coats. Her stud cat “Blue Noble” has sired many noted winners, and “My Honey,” a lovely queen, has the deepest orange eyes I have ever

seen. Mrs. Wells takes the greatest interest in her cats, and each and all are pets; in fact, so great is the care and devotion bestowed upon them that Mrs. Wells is very seldom persuaded into exhibiting any of her beautiful blues, and never lets them attend any shows unless she herself is able to accompany them.

Mrs. Wells' cottage is situated in a most rural district of Isleworth, and one might fancy oneself miles and miles away from the busy haunts of men. At the time the photos illustrating these catteries were taken Mrs. Wells had eighteen blue kittens, besides several grown-up representatives of her favourite breed. At one time Mrs. Wells was bitten with the silver fever, and began to breed this variety; but the litters did not give satisfaction, and she determined to return to blues—with what success can be learnt from a visit to the gardens at Isleworth.

Miss Gertrude Jay started cats in 1891, and her name will always be connected with blues. Nothing has ever been exhibited to compare with her wonderful female "The Mighty Atom" as regards beauty and shape of head. This cat, now, alas! no more, swept the board wherever it was shown. Twice she carried off the highest honours for best cat in the show at the Crystal Palace. It is true that this grand specimen lacked the orange eyes, but no judge could pass over such a perfect type of cat, despite her one fault, and thus "The Mighty Atom" reigned supreme. "Trixie" and "Doris," two of Miss Jay's noted blues, have also both won specials for the best cat in the show at the Crystal Palace. Miss Jay is fortunate in having some descendants of these precious cats in the luxurious catteries at Holmwood (of which an illustration is given). Many lovely blues may be seen revelling in the well-appointed houses set apart at the end of the long terrace for their special use. Miss Jay about a year ago retired from the cat fancy, and withdrew her name from the two clubs; but she is still a vice-president of the Blue Persian Cat Society, and often acts as judge. Her name always draws a good entry, and, as a well-known fancier once remarked to me, "You can be sure of getting your money's worth when Miss Jay has the handling of the classes." The following few remarks from Miss Jay on her method of judging will be read with interest:—

"I fear my way of judging is unlike most other people's, because I do not judge by points unless it comes to a close fight between two cats. Of course, I consider shape and colour first, and then I mark all those unworthy to be in any prize list; next get to work with the remainder, and this I do, as I say, unlike most other judges, for I pick out the cat that I would soonest have given to me that day, with the object of showing it again at once. The point to be decided is the best cat _that_ day. It is no use beginning to think which cat will be the best in a month's time or which cat might have been best a month ago; it is there _that_ day—which is best? And, to my mind, if I award first to the cat I would rather have, with the one object of continuing to show it, _that_ surely must be the best cat in my opinion, and to that cat the first card goes. And so on through the class, only giving one V.H.C., one H.C., and one C., unless the class is a very large one. I know some judges who say commended cards are very cheap, and they please the exhibitors. True; but are you not pleasing them in a wrong way by making them think their cat is better than it is?"

[Illustration:

"SCARED."

TWO BLUES BELONGING TO LADY MARCUS BERESFORD.

(_Photo: Cassell & Company, Limited._)]

Mrs. Herbert Ransome is well known in the feline world as a successful breeder of blue Persians, and as the hard-working secretary of the Northern Counties Cat Club, and more recently as the editor of _Our Cats_. Her two blue stud cats, "Darius" and "Darius III.," have earned a great reputation, not only in the show pen, but as the sires of many lovely prize-winning kittens, notably "Orange Blossom of Thorpe," owned by Mrs. Slingsby, of Ouseburn, Yorkshire.

It is only of recent years that the name of Mrs. Paul Hardy has become known in the feline world as a breeder of blue Persians. Mrs. Hardy was a member of the Cat Club Committee, but on her removal to some distance from London she resigned her post. To her the Cat Club is indebted for a very beautiful design of a medal which, in silver and bronze, is competed for at the Westminster and other shows (_see_ illustration).

CAST OF THE CAT CLUB MEDAL.

DESIGNED BY MRS. P. HARDY.]

Her first adventure into the domain of cat keeping was in the case of a very fine blue cat named “Juliet,” whose first few litters were not a great success, so that sensible cat took matters into her own hands. She chose for her mate the raggedest black tom she could find, and though, of course, the results of this _mésalliance_ were not at all satisfactory from the show judge’s point of view, in later years, when suitably mated, “Juliet” did not once throw back to a wrong-coloured kitten. I am not sure that I can follow Mrs. Hardy to the logical conclusion of her deductions from this fact, but I think it is worthy of notice by those extremists who hold the view that an incorrect mating in the first instance spoils a queen for the rest of her life.

It was at the Crystal Palace show of 1897 that Mrs. Hardy exhibited her first litter from her blue stud “Wooshoo,” and she was then awarded a first, a special, and two or three silver medals. Another famous cat in Mrs. Hardy’s establishment was a blue, named “Mark Antony,” who met with success at several Scottish shows. Later he came under the notice of Mrs. Mackenzie Stewart, into whose hands he passed, and received a good deal of favour at the hands of the judges. From Mrs. Stewart he passed into the possession of the late Dr. Longwill, and was sire of the famous Crystal Palace winning female blue, “Dolly Gray,” in 1902.

Mrs. Hardy’s success has not been achieved without some set-backs, more particularly of recent years, since her cattery has been enlarged, and she has had to fight her way against disease and death. Her own account is so vivid that I quote it, so that fanciers in a like evil condition may fight for the lives of their pets to the last:—

“I was singularly free from illness of any kind amongst them, and I lived for some time happy in the belief that the Persian puss was in no wise different from her short-coated sister in the robust possession of nine lives; so I added cat unto cat, and bred for show; when swiftly Nemesis overtook me. I showed five full-grown cats at the first Westminster show, and twenty-four hours after the show was over my best blue queen, a young beauty whose proud owner I had been only for one brief month, died of acute pneumonia. A few days later influenza showed itself amongst the others, and all four were down with it.

“What a time I had, with the experiences of a ward-nurse! But I pulled them through, all but one young kitten of four months, in whom acute laryngitis developed, and so she had to be put to sleep.

[Illustration:

MISS G. JAY’S CATTERY.

(_Photo: W. Field, Putney._)]

“‘Wooshoo’ was given up by the vet., as he piled so many complications into his system one after the other, developing bronchitis, gastritis, and jaundice on the top of the original complaint. Poor fellow, for twenty-four hours he lay _unconscious_, but I kept his heart going by doses of _pure alcohol_ every two hours, while I fought the disease with hot fomentations, medicated steamings, and other proper remedies.

“For just _one month_ I had to hand-feed him, and then one afternoon it occurred to him he might try his minced oyster by himself, greatly to my joy and triumph; and when he feebly washed his face afterwards I felt like setting the church bells ringing!

“I am convinced, in serious cat illness, it is the _night nursing_ that does the trick and determines whether your patient is to live or die. It is somewhat of an effort, I admit, to have to arise two or three times in a night (nearly always in the bitter weather, when these epidemics occur), and, in my case, to be obliged to dress and go out of doors to the stableyard, with a dimly burning lantern.

“In every cat lover’s career there must be some such saddening memories. Saddest when, after the efforts of the night, and you have left hopeful the morning will bring improvement, you return in the early dawn to note on entering a sign that causes your heart to beat heavily—_your patient’s bed is empty_!

“You know what _that_ means, and look round. Yes, there in a corner, flat, stiff, and draggled, where he has crawled in the last uneasy seeking for air, is your poor pet, still for ever!”

Mrs. Hardy, in connection with illnesses, has some advice to offer as regards medicines which she has tested herself, and which I think will be of service to my readers:—

“While not intending to say anything authoritatively upon the subject of remedies for various cat ills, all of which will be most ably and exhaustively gone into by the writer of later chapters in this book, I might perhaps mention one or two things of which I have had personal experience, restoratives rather than drugs, which I now keep always at hand.

“One is a preparation of beef called ‘Somatose.’ It is sold in 1 oz. or 2 oz. tins, is in the form of a fine soluble powder, and has this advantage over certain beef essences—that it will keep good any length of time, and has not to be used up directly the tin is opened; while it is no more expensive, and a little will go a long way if used as directed.

“I make it by putting some _boiling_ water into a saucer, sprinkling about a teaspoonful on the water, and allowing it to dissolve slowly till cold, when it would look like weak tea. It is a most powerful restorative and stimulant, and given _cold_ in teaspoonful doses can be retained in the worst case of stomach irritation.

“A second good thing is Plasmon powder. I was recommended to try this by a cat lover, for a case of dyspeptic sickness of a chronic character. For delicate kittens it is most valuable, and I believe the very worst cases of diarrhœa or dysentery can be cured, and the patient saved to grow up strong and healthy, if a diet of Plasmon jelly, given cold, with alternate meals of Somatose, also given _cold_, be persevered with until the bowels are normal. Never give milk in _any_ form, either plain, boiled, or in puddings, to a cat that is suffering from looseness of the bowels. Another little hint I may be allowed, perhaps, to give: Don’t wait for illness to come before you train your kittens to _take_ medicine from a spoon.

“I teach all my youngsters to drink easily from a spoon, beginning with something nice—sweetened milk or the like, going on to cold water and, when necessary, a drop or two of Salvo’s Preventive in it. Then, when it becomes necessary for a real nasty dose, they are not in the least nervous of the spoon beforehand, and the dose is down and gone before they discover anything unusual. Never have I to wrap cloths round any of my cats, or get people to hold them by main force; but some cats will nearly turn themselves inside out when a spoon is held to their mouths! All the fault of early training. Badly brought up! You must be _very_ patient with a young kitten; never do anything in a _hurry_. When once you have gained a cat’s confidence it will let you do anything to it.”

CHAPTER XII. SILVER OR CHINCHILLA PERSIANS.

[Illustration:

“JACK FROST.”

BRED BY MRS. MIX, OLD FORT BATTERY, NEW YORK.

(_Photo: A. Lloyd, Amsterdam, N.Y._)]

Perhaps no breed or variety of cat has been so much thought about, talked about, and fought about in the fancy as the silver or chinchilla Persian. If blues are a new variety, then silvers are of still more recent origin. Years ago this cat did not exist—that is to say, we should not recognise the silver Persian of to-day as the silver of bygone times, for the simple reason that the only class of silver in the fancy formerly was the silver tabby. In those days there were self-coloured cats and tabby, or marked cats, and broken-coloured cats. Previous to the introduction of a Chinchilla class at the Crystal Palace in 1894, the class for silver tabbies included blue tabbies “with or without white,” and it is curious to read in the old catalogues of the Crystal Palace shows the titles given to the various cats by the owners, some describing their cats as “chinchilla tabby,” “light grey tabby,” “silver grey,” “silver chinchilla,” “blue or silver striped.” We may infer that these cats were either blue tabbies or silver tabbies, or something betwixt and between. I distinctly remember the large number of cats which in these enlightened days we should find it difficult indeed to classify. It is often said, “What’s in a name?” But still, in trying to describe a particular breed of cat, it is as well to endeavour to find a term which expresses as nearly as possible both the colour and the appearance of the animal. There has been a great deal of discussion as to the correct name by which these delicately tinted Persians should be called.

The National Cat Club began by classifying them for the Crystal Palace show in 1894 as Chinchillas, and they have kept to this, although it is really a most misleading title, as the cats are quite unlike the fur which we know as chinchilla, this being dark at the roots and lighter towards the tips. Now, cats of this variety ought to be just the reverse.

It is difficult to give a correct idea of the real colour and appearance of these cats. The fur at the roots is a peculiar light silver, not white, as one might imagine, until some pure white is placed beside it, and this shades to a slightly darker tone—a sort of bluish lavender—to the tips of the coat. The Cat Club introduced the term “self silver,” but this is suggestive of one colour only, without any shadings whatever. Another class, called “shaded silvers,” was added; but then, again, tabby markings are not shadings. Formerly, blues used to be called “self blues,” but this is entirely done away with, and now we never think of using this term, and speaking of them as blues we understand there should be the one and only colour.

Surely, then, the simplest term and the most descriptive of these beautiful cats is “silver,” pure and simple, for whether dark or light they are all silvers, and so we should have blues and blue tabbies, orange and orange tabbies, silver and silver tabbies.

Then comes the question of what is nearest perfection in this variety of cat, which has come upon us of late years, evolved from the silver tabby and the blue. The ideal silver, to use the words of a well-known breeder of these cats, should be the palest conceivable edition of a smoke cat, with fur almost white at the roots and palish silver grey at the tips, and as free from markings as a smoke. I do not go the length of declaring that silvers cannot be too light, for I think that it is the delicate tips of silvery blue that lend such a charm and give such distinction to this variety. Without these delicate tippings a silver cat would look inartistic and insipid. There has been of late quite a rage amongst silver breeders to produce a totally unmarked specimen; but fanciers would do better to endeavour to obtain a light _shaded_ silver free from tabby markings with the broad head and massive limbs, which at present are qualities not often met with in this variety. I am quite aware this is a most difficult task, but we must remember that “all good things come hard,” even in breeding cats, and if it were not so half the interest for fanciers would be gone.

SILVER PERSIAN OWNED AND BRED BY MISS MEESON.

(_Photo: F. Parsons, Southend-on-Sea._)]

Having, therefore, considered what a perfect silver cat ought to be, I will give a description of the type of cat generally bred and exhibited as a silver. I read the following account in one of our daily papers, evidently written by a non-admirer of these lovely cats: “The chinchillas are very fashionable, and very difficult to breed in perfection. They took their name from a supposed likeness the fur bears to that of the chinchilla. But the chinchilla cat, as at present in request, bears no resemblance to the little rodent. Most of the exhibits are of a dirty white, tinged with lavender, with a quantity of marks and stripes on the face, body, and paws.” Now this is not a pleasing picture, and one that would be considered libellous by a silver breeder. It is, however, true that at present our silvers are too full of tabby markings, and in many cases the under-coat is not silvery white, but light grey or pale blue. There are many silver cats with dark spine lines and shaded sides, but they are heavily barred on the head and legs, and the tail is frequently almost black. It is a case of tabby blood which needs breeding out of the silvers, and which, no doubt, will be obliterated in time, so that two distinct types of silvers will only exist—the delicately tipped or shaded silvers, and the richly marked and barred silver tabbies. Just as in the case of the blue Persians it took a long while to eradicate the tabby markings which showed the existence of tabby blood, so amongst silvers the bar and stripes need to be carefully bred out, and we shall hope, in the good time coming, to have not _self_ silvers, but a very near approach to this—namely, a perfectly unmarked but yet not wholly unshaded silver cat.

[Illustration:

“OMAR.”

THE PROPERTY OF MISS A. POLLARD

(_Copyright 1901—G. Hiller, Elizabeth, N.Y._)]

There is a greater delicacy amongst silver cats, and more difficulty in rearing the kittens, than in any other breed, and this may be accounted for by the immense amount of in-breeding that was carried on indiscriminately at the beginning of the rage for silver cats; also the desire to obtain lightness of colour caused breeders to lose sight of the grave disadvantages of loss of bone and stamina. Therefore it is that among the silver cats exhibited at our shows we seldom find massive limbs or broad heads or full cheeks. There is a tendency to hare-like proportions, and the faces have a pinched and snipey appearance, and noses are too long. However, great improvement is taking place, and with the numerous stud cats now at the disposal of fanciers, there ought to be no difficulty in making a suitable selection.

The question as to the correct colour of eyes for a chinchilla or silver cat is still a vexed question. In self-coloured cats the broad line is clearly laid down—blue eyes for whites, orange for blacks, and orange for blues; but when we come to the more nondescript cats—such as silver and smoke and tortoiseshell—there seems to be a wider margin given, and the line drawn is not so hard-and-fast. Still, I think it is always well to have some high standard of perfection in each breed, so that fanciers may breed up to it, and to my mind the bright emerald green eye is the ideal for a silver cat. I have seen very fine amber eyes which could not fail to attract admiration; but if these are admitted, then all sorts of eyes, not amber but wishy-washy yellow, will be the inevitable result. So many silver cats have eyes that may be described as neither one thing nor the other. Often one hears the remark, “Oh! but if you see So-and-so’s eyes in the right light they are a lovely green.” But viewed by the ordinary eye of a critical judge, they appear an uncertain yellow. Therefore it is best to set up a standard, and I think it is becoming an almost undisputed fact that silver cats of perfect type should have green eyes, and by green let it be understood that the deeper the tone the better will they accord or contrast with the pale silvery coat.

[Illustration:

THREE PRETTY SILVERS.

(_Photo: C. Reid, Wishaw._)]

I would here impress upon fanciers the great importance of striving to obtain the large, round, full eye, which gives such expression to a cat’s face. How many of our silvers of to-day are spoiled by small, badly shaped or half-open eyes! I do not think sufficient importance is attached by our judges to this point of _size_ of eye. Many are carried away by the correctness of colour, and fail to deduct a sufficient number of points for a beady, badly shaped small eye.

Colour is fleeting, and with age our cats may lose the brilliancy of green or orange, but bold large eyes, placed well apart and not too deeply sunk, will be lasting points in favour of our pets.

There is one rather peculiar feature in the eyes of some silver cats. This is the dark rim which often encircles the eye. This rim decidedly enhances the beauty of the eye, and makes it look larger than it really is, and also throws up the colour. Light, almost white, ear tufts and toe tufts are adjuncts which go to make up a perfect silver cat. The nose is of a dull brick red, darkening slightly towards the edges.

Few Persian cats suffer so severely during the process of shedding their coats as silvers, and they present a most ragged appearance at this period of their existence. The lovely fluffy light silver under-coat almost disappears, and the top markings stand out very distinctly, so that a cat that in full feather would be considered a light, unmarked specimen will appear streaked and dark after the coat has been shed. As regards the silver kittens, it is a curious fact that these, when born, are often almost black—or, at any rate, generally very dark in colour, resembling smokes. It is seldom that a silver kitten is light at birth, but gradually the markings and shadings will lessen, and perhaps just the one mite that was looked upon as a bad black will blossom forth into the palest silver. In this respect, silver kits are most speculative, but in another they are cruelly disappointing, for a kitten at three months old may be a veritable thing of beauty, and ere it has reached the age of eight months, bars and stripes will have, so to speak, set in severely, and our unmarked specimen of a silver kit develops into a poorly marked tabby cat. I may say that if the kittens are going to be really pale silvers they will in the majority of cases have very pale faces and paws, with little or no marking, whilst the body will be fairly even dark grey—perhaps almost black. In a week or two a change takes place, as the under-coat begins to grow, and it will be noticed that the kittens become more even in colour, the contrast between their light face and dark backs will not be nearly so accentuated, and by the time they are nine or ten weeks old they will look almost unmarked. The reason

for this is that the dark fur they are born with is really only the extreme tips of the hair, and as their coats grow in length this shading becomes more dispersed.

And here I will allude to the so-called threefold classification which was part of the scheme of the Silver Society, founded by Mrs. Champion in 1900. At the inaugural meeting Mrs. Stennard Robinson took the chair. Voting papers had previously been distributed amongst the members, asking for their votes on the question of establishing three classes for silvers—namely, chinchillas, shaded silvers, and silver tabbies. The votes recorded were fifty-four in favour of the threefold classification, and nine against it. So this was carried by a large majority, and the question of points discussed and settled as follows:—

CHINCHILLAS.

As pale and unmarked silver as possible. Any brown or cream tinge to be considered a great drawback. Eyes to be green or orange. Value of points as follows:—

Head 20 Shape 15 Colour of coat 25 Coat and condition 20 Colour, shape, and expression of eyes 10 Brush 10 ——— Total 100

After much discussion, Lady Marcus Beresford moved, and Mrs. Champion seconded, the following definition of Shaded Silvers:—

SHADED SILVERS.

Colour: pale, clear silver, shaded on face, legs, and back, but having as few tabby markings as possible. Any brown or cream tinge a great drawback. Eyes green or orange. Value of points:—

Head 20 Colour of coat 25 Coat and condition 20 Colour, shape, and expression of eyes 10 Shape 15 Brush 10 ——— Total 100

[Illustration:

“SHAH OF PERSIA.”

THE PROPERTY OF MRS. ANNINGSON.]

From this list it will be seen that for colour the highest points are given, and that eyes may be green or orange. But during the two years which have elapsed since the formation of the Silver Society, there has been a decided desire on the part of breeders for green eyes _only_, and certainly our best qualified silver judges are not partial to any other coloured eyes in this variety. In an article on the colour of eyes in silvers, “Zaida” of _Fur and Feather_ writes: “Eye colouring threatens to become a matter of fashion. Some eight years ago we received from a first-rate fancier and exhibitor a letter respecting a chinchilla cat, which later became a great prize-winner. ‘It is useless,’ wrote this lady, ‘to think of exhibiting her on account of her green eyes.’ What a change of opinion has marked the flight of eight years!”

It will be observed that, as regards the description of chinchillas and shaded silvers, there is a distinction and yet no very great difference, and herein lay the difficulty of retaining these two classes at our shows. The lightest silvers were deemed eligible for the chinchilla class, and then came the question for exhibitor and judge to draw the line between the two so-called varieties, and to decide what degree of paleness constituted a chinchilla and what amount of dark markings would relegate the specimen into the shaded silver class. The cat world became agitated, exhibitors were puzzled, and judges exasperated. There were letters to the cat papers on the “silver muddle.” Show secretaries were worried with inquiries. I recollect a would-be exhibitor writing to me sending a piece of her silver cat’s fur, and asking whether her puss should be in the chinchilla or shaded silver class; but even with her lengthy description and the sample before me, I dared not venture an opinion, and I used generally to reply to such letters by saying I did not know in which class to enter my own silver cat, and so I was going to keep him at home.

One correspondent, appealing through the columns of the papers, wrote: “Everyone knows a black or white or brown tabby, but how can we exhibitors discern between the number of shadings on our silver cats as to which class they belong? Do kindly air my grievance, and oblige.”

It was quite pathetic to see the faces of disappointed exhibitors at the Westminster show of 1901, when several beautiful creatures who had travelled many a weary mile to be penned and admired were rewarded with a “Wrong Class” ticket only. They were either too light or too dark for the class in which their owners had entered them, and all hope of honour and glory and golden coins and silver cups vanished into thin air! At one show I recollect a cat was accounted by the judge a chinchilla _and_ a shaded silver, and

he came off very well with special prizes for both varieties. No doubt he really was either one or the other, or both!

[Illustration:

“FULMER ZAIDA.”

SILVER, OWNED BY LADY DECIES.

(_Photo: E. Landor, Ealing._)]

It was no wonder, therefore, that a reaction set in, and exhibitors and judges felt alike that something must be done, and that, at any rate for a time, it would be better to have only the two classes for silvers and silver tabbies, and that specials might be given to encourage the lightest cats. The abolition of the threefold classification was therefore taken into consideration when the Silver Society was broken up by the departure of Mrs. Champion to America, and the Silver and Smoke Persian Cat Society came into existence, with Mr. H. V. James as Hon. Secretary.

The following are the objects of the Society:—

The title of this Society, which (under the name of The Silver Society) was founded in July, 1900, is “THE SILVER AND SMOKE PERSIAN CAT SOCIETY.”

The objects of the Society are:—

1.— To improve the breeds of long-haired silver (or chinchilla), shaded silver, silver tabby, and smoke coloured cats and kittens, male, female, and neuter.

2.— To guarantee extra classes for these breeds at shows supported by the Society, when necessary.

3.— To offer prizes for the said breeds at shows supported by the Society.

4.— To hold shows independently, or in conjunction with other Societies or Clubs when it shall be deemed expedient by the members.

5.— To elect specialist judges to make the awards at shows supported by the Society.

6.— To establish and maintain a standard of points for the above-mentioned breeds.

It was in March, 1902, that voting papers on this burning question were sent out to members of the new society, with the following result: For the threefold classification, 20; against, 32. Therefore, by the wish of the majority, it was decided to give up the threefold classification _for the present_.

[Illustration:

“TROUBADOR.”

SILVER, BRED BY MRS. E. N. BARKER.]

The Silver and Smoke Persian Cat Society is now in a most flourishing condition, with about 150 members. It is the fervent hope and earnest endeavour of each and all of the fanciers of silvers in the society to breed a perfectly unmarked specimen, and with perseverance we may in time puzzle the judge to decide which cat in a large class of lightly tinted silvers is the palest. We shall gradually but surely breed out the tabby markings if fanciers will, so to speak, nail the right colour to the mast and keep on striving to breed up to the perfect type.

To quote Mr. C. A. House: “What is wanted is for breeders to work on standard lines, and not push forward with such persistency their own pet particular whims. All that is required is for breeders to be determined to breed honestly and consistently for what the standard advocates, and leave severely alone all excesses and exaggerations. Let us have chinchillas free from markings by all means, but let us keep our shadings, our silver colour, remembering that pure silver is of a bluish tinge, and is not the whitey-brown article some would have us accept as the ideal in chinchilla cats.” The same authority, writing on the threefold classification, says: “I have always maintained that the threefold classification in silvers was a mistake, and the majority of breeders, I am pleased to know, are coming round to that view. My opinion, when first enunciated, was not popular. With some it is not to-day. But many who

at one time could not see the force of my arguments now do so, and there is a more general feeling that the craze for self silvers is not conducive to the welfare of the silvers as a breed."

Amongst the well-known breeders, fanciers, and exhibitors of silvers in the present day, I may mention Lady Marcus Beresford, who owns some beautiful specimens of the celebrated "Lord Southampton" strain. A handsomer type of silver female cannot be met with than "Dimity," bred by Miss Cochran, and presented by her to Lady Marcus Beresford. Lady Decies is the proud possessor of the incomparable "Zaida," whose record of wins is a marvellous one. As all the cat world knows, "Zaida" is accounted the lightest and most unmarked specimen in the fancy. Mrs. W. R. Hawkins has bred some wonderfully good silvers, and was the owner of "Sweet Lavender," which has been acknowledged as one of the best of this breed that ever existed. The following are the principal silver breeders: The Hon. Mrs. McLaren Morrison, Mrs. G. H. Walker, Mrs. Neild, Mrs. Russell Biggs, Mrs. Wellbye, Mrs. Martin, Mrs. T. Drake, Mrs. Cubitt, Mrs. Marriott, Mrs. Balding, Mrs. Poole, Mrs. Ormerod, Mrs. Fawsett, Miss White Atkins, Miss Snell, Miss Horsman, Miss Dell, Miss Meeson, The Hon. Philip Wodehouse, Miss Chamberlayne.

During the last few years a very large number of silver cats have been placed at stud, but we may regard three cats as the founders of the breed or as the pillars of the silver strain—namely, "Silver Lambkin," "Lord Southampton," and "Lord Argent." To these worthy ancestors a very large proportion of the silvers of to-day can trace their lineage. But this noble trio is naturally being superseded by such stud cats as "Silver Starlight," "Tintagel," "Cambyses," "The Absent-minded Beggar," "Pathan of Dingley," "Jupiter Duvals," "St. Anthony," "Rob Roy of Arrandale," "The Silver Sultan," and many others. There is, therefore, now no excuse for in-breeding, which used to be carried on to a great extent when so limited a number of sires were forthcoming. To indiscriminate and injudicious in-breeding may be largely attributed the great delicacy amongst silver cats. There is no doubt that the number of fatalities among silver kittens is far in excess of that of any other breed. Then, again, the size of silver cats compares unfavourably with others, and they are wanting in muscle and bone. We do not want huge, coarse, heavy silvers, but breeders and judges sometimes show an utter disregard for size and strength, and the consequence is we see a number of ladylike looking studs that fail miserably in these very essential points.

Breeders should aim at the happy medium between the liliputian and the leviathan, but not be content unless their silver studs turn the scales at 10 lb. As regards the mating of silvers, a broad line to lay down is to avoid tabby markings. It is for this reason that smokes have been wisely selected by most breeders as the best cross for a silver. It is more than probable that in many cases some nondescript sort of kittens will be the result. These sort of light smokes are exceedingly pretty cats and make fascinating pets, but they are useless for breeding purposes or exhibiting. I have known of some handsome specimens that have wandered from class to class, only to be disqualified in each and either, and it was a case of, "When judges disagree, who shall decide?"

Several experiments have been tried of crossing a white Persian with a silver in order to get pale coloured kittens, but this appears seldom to succeed unless the whites have silver blood in them. Some breeders have tried blues with silvers, but there is the danger of introducing the grey blue under-coat which gives such a smudgy appearance to a silver and is suggestive of a badly coloured smoke. It does not at all follow that the mating of two light silvers will produce light-coloured and unmarked kittens, yet this cross and the smoke are the safest. It must be a work of time, as we have before said, to breed out the tabby markings of many generations.

The name of Mrs. Balding is as well known to breeders of silvers of the past as it is at the present day. In the past, however, it was as Miss Dorothy Gresham this enthusiastic fancier won her laurels. I well remember the sensation caused by the appearance in the show pen of the "Silver Lambkins" at the Crystal Palace in 1888. To breeders, exhibitors, and cat fanciers generally the following account of chinchillas from the earliest days, specially written for this book by Mrs. Balding, should be exceedingly interesting:—

"There is probably no variety of long-haired cat which has caused so much discussion, notwithstanding that, with the exception of the light-coloured reds, which have been designated 'creams,' the chinchilla is the cat which has most recently gained distinction as a separate variety. The notoriety which the chinchilla enjoys has been in great part brought about by the delicacy of its appearance and the difficulty that has been experienced in the production of a perfect specimen. Many cats are called chinchillas and are exhibited as such, often winning prizes, but very few indeed are of the pale silver tint, with bright emerald eyes, and with no bars or stripes on the legs or head.

[Illustration:

A PERFECT CHINCHILLA.

TWO VIEWS.

(_Photo: E. Landor, Ealing._)]

“The chief subjects that have been under discussion in connection with the chinchilla cat have been the colour of eyes and the shade of the coat; but, with regard to the former, I think it must be acknowledged that green is a more suitable accompaniment to silver than yellow or orange, and, as regards the latter, that silver, with dainty sheen evenly distributed, is more to be desired than a patchy grey, dull in hue and unattractive to the eye. As a matter of fact, these shaded grey specimens are in reality only ill-marked silver tabbies. They must, however, not be altogether despised, as they have been the steppingstones which have led to the creation of the chinchilla.

“It is something like twenty years ago that, amongst the competitors in the classes for long-haired tabbies at the Crystal Palace and other important shows, was occasionally to be seen an alien with the ground colour of the silver tabby, but with very few stripes on the body. These cats were evidently sports from the silver tabby, so much so that the class for that section was the only one open to them; and, although they invariably showed great quality, breeders were loth to exhibit them in the medley of different-coloured tabbies, where one of their chief beauties—the absence of stripes—became a disadvantage. Their only chance of distinction lay in putting in an appearance at provincial shows, where the authorities were sometimes to be induced to attach two cat classes to the rabbit division—one for long-haired of any colour, and the other for short-haired. In this indiscriminate assemblage, no colour having been stated, chinchillas when present wrought great havoc, although it cannot be denied that the judges of the day gave precedence to a well-marked silver tabby.

“Amongst these outcasts was a cat of striking beauty, whose like has not been seen again. This was ‘Sylvie,’ of unknown pedigree, owned by the late Mrs. Christopher, at whose death she became the property of the late Miss Saunders, of Peterborough. A beautiful portrait of this exquisite chinchilla is given in Mr. Harrison Weir’s book ‘Our Cats.’ When judging at the Crystal Palace in 1886, this connoisseur and judge of worldwide repute awarded her first prize, medal, and special for the best long-haired cat, getting over the difficulty of her silvery, unmarked coat by calling her a very light blue tabby, though the puzzle was to find the tabby.

“Another chinchilla of the early ‘eighties was Miss Florence Moore’s ‘Queenie,’ who would, had chinchilla classes been provided at that time, have been loaded with championships and honours. In colour she was as light as any of our present-day celebrities, and might easily, from her freedom from markings, have earned the dubious compliment of the uninitiated so highly prized by owners of chinchillas of being mistaken for a grubby white. Miss Florence Moore, who later on had one of the best and largest catteries in the country, bred ‘Queenie’ from her ‘Judy,’ winner of many first prizes, a heavily marked silver tabby of Mrs. Brydges’ noted breed, and ‘Fez,’ a light silver cat with indefinite stripes.

MRS. BALDING’S “SILVER LAMBKIN.”

(_Photo: E. Landor, Ealing._)]

“Mrs. Brydges can claim the distinction of having owned, something like half a century ago, some of the first long-haired cats ever imported into England. A coincidence worthy of note is that though there is no record of her having bred or possessed a chinchilla, two never-to-be-forgotten pairs of chinchilla kittens—Miss Florence Moore’s ‘Chloe’ and ‘Dinah,’ winners of first and medal on three successive occasions at the Crystal Palace, Brighton, and Bexley, 1887 (they being the only chinchillas at any of these shows), and Miss Gresham’s ‘Silver Lambkins,’ who swept the board in 1888, winning the specials at the Crystal Palace from forty-six pairs of other competitors of all colours—could in each case trace descent to the Cheltenham stock ‘Chloe’ and ‘Dinah,’ through the afore-mentioned ‘Judy’ and the ‘Silver Lambkins,’ through their sire ‘Rahman,’ also bred by Mrs. Brydges.

“Still more remarkable, these two couples of youthful prodigies were first cousins, on the other side of their pedigrees, the noted ‘Fluffy II.’ and ‘Beauty’ being bred by Mrs. Vallance.

“‘Chinnie,’ the Mother of chinchillas, is familiar in name to every breeder of this lovely variety, and the following letter, of the early ‘eighties, relating to her birth and buying, will perhaps prove interesting to the up-to-date silver fancier. It is copied from the original in the possession of Mrs. Vallance. One guinea appears to have been a price to talk of in those days. Now, one would be tempted to hide the fact of such a small amount, and if a specimen were offered to us at this low figure we should certainly desire it to be

sent on approval.

THE VICARAGE, SANDAL MAYNER, NEAR WAKEFIELD, _October 14th, 1882_.

‘_To_ Mrs. VALLANCE.

‘MADAM,—The kitten I have to sell is quite pure bred. The mother I bought for £1 1s. when quite a kitten from prize parents. The father is one we bred partly from Mrs. Radford’s breed and partly from a splendid tom cat that was found living wild at Babbicombe, and that we had in our possession for some months, but unfortunately he is lost again now—I am afraid permanently. I think this kitten promises to be very like the mother. She is very handsome and has good points—brush, ear tips, and so on—but I consider her rather small. But the kitten may be finer, as the father is a large cat. Miss Grant’s are related to ours on the father’s side, but Mrs. Radford’s very distantly, if at all.

‘I do not think these Angora kittens are delicate. We have never failed in rearing them. The more new milk they have, and the better feeding, the finer cats they are likely to make. We do not have much trouble in keeping ours at home, as we live some distance from the village. We always give ours their principal meal at 6 p.m., and keep them shut up in a hay-loft until next morning. If you have a box wherever the kitten lives, with sifted sand or cinders in it, kept in a corner, you will find that the best way to ensure habits of cleanliness. If I hear nothing from you to the contrary I will send the kitten on Wednesday morning, 19th, by the early train from Derby station; and if you are not satisfied with the kitten I am willing for it to be returned within a day or two, if the return journey is paid and I am let know beforehand when to expect it.

‘I remain, yours truly, ‘GRACE HURT.’

A letter redolent of lavender and old-world deliberation, but words of wisdom for all that. The reported delicacy of long-haired cats would trouble us less if we had more of the new milk and hay-loft system. Raw meat, raw eggs, new milk, fresh air, grass, and water are the sole ingredients required to rear the most valuable kitten.

“‘Chinnie’s’ size is another interesting point. She grew to medium weight, but was remarkable for symmetry of form rather than bulk.”

“Some of the loveliest chinchillas are small, but ‘Nizam,’ ‘Tod Sloan,’ ‘Ameer,’ ‘Silver Lambkin,’ ‘Laddie,’ ‘Lord Argent,’ ‘Silver Mist,’ ‘Cherub,’ and ‘St. Anthony’ stand out as being as large, or larger, than any cats of other colours, and the majority of them have also the purity of colour, broad heads, and short legs so often lacking in large cats. The legginess and want of quality which frequently accompanies size doubtless cause our leading judges to deem it of little account.

[Illustration:

MRS. BALDING’S “FLUFFIE TOD.”]

“The name chosen by Mrs. Vallance for her new acquisition proves that even in those early days the term chinchilla was in vogue. ‘Chinnie’s’ wins were third Maidstone, Sittingbourne, V.H.C. Oxford, Maidstone. Her charming little mate ‘Fluffy I.,’ a very pure silver with undecided tabby markings, also showed the quality of coat and cherub face for which their descendants have been unsurpassed. He was bred in 1883 by Miss Acland from imported cats, and won first and medal at Maidstone, Cheltenham, and Ealing, second Ryde, V.H.C. Crystal Palace, Oxford, and Lincoln. His career ended in 1886, when he disappeared. Tradition whispers he was destroyed in the village.

“In April, 1885, ‘Chinnie’ produced a litter by ‘Fluffy I.,’ two members of which—‘Vezzoso’ and ‘Beauty’—have earned undying fame in the annals of chinchilla history. ‘Vezzoso,’ a marvel of lavender loveliness, in his one brief year of existence won first in the open class and silver medal for best in show Albert Palace, 1885, first Louth, Maidstone, second Frome, third Lincoln.

[Illustration:

“SEA FOAM.”

THE PROPERTY OF MR. LAUGHTON.]

“In fatal 1886 ‘Vezzoso,’ who belied his exquisite appearance by being very undomesticated, like his maternal grandfather the wild cat of Babbicombe, roamed to return no more. ‘Lost in the woods’ is his epitaph.

“An even more tragic fate befel ‘Fluffy II.,’ the 1886 son of ‘Fluffy I.’ and ‘Chinnie,’ who after winning first Crystal Palace, first and silver medal for best in show Brighton, second Albert Palace and Ealing, and siring the two before-mentioned kittens of the year, died in 1887 from the effects of an accident in which he was internally injured. Thus within little more than a year Mrs. Vallance lost three of the most promising young cats anyone could possess. At the time their owner scarcely realised their value, and allowed them absolute freedom, with such sad results.

“But undoubtedly the best result of the ‘Fluffy’ and ‘Chinnie’ alliance was ‘Beauty,’ from whom, as already stated, came the ‘Silver Lambkins.’ As a kitten she became the property of Miss Howe, of Bridgyate, near Bath, and later, by a breeding arrangement with the Miss Greshams (now Mrs. Bridgwater and Mrs. Balding), had three remarkable litters of chinchilla kittens, the first by ‘Rahman,’ who shortly afterwards strayed from home and was lost. This was the litter which produced four queens, including the two ‘Silver Lambkins,’ and which (with the exception of one renamed ‘Mimi,’ who went to America with her owner) all unfortunately died.

“The second of Bridgyate ‘Beauty’s’ litters was by Mrs. Shearman’s ‘Champion Perso,’ a magnificent light smoke with remarkable coat and wonderful mane, winner of a large number of first and special prizes. In this lot was a tom kitten destined to be a pillar of the chinchilla stud book, the ‘Silver Lambkin,’ named after his deceased half-sisters. The chief beauties of this remarkable cat are his size and muscular frame, the length and thickness of coat, and the enormous frill inherited from ‘Champion Perso,’ which spreads Elizabethan like round his shoulders and falls to his feet in front, a cascade of silvery white fluff several inches long. To ‘Perso’ may be traced in some degree ‘Silver Lambkin’s’ success as the sire of unmarked cats, and to ‘Beauty’ their pale colour, green eyes, and perfect shape, which have won for her descendants by ‘Lambkin’ upwards of 150 first prizes.

“At the time ‘Silver Lambkin’ was bred there was no chinchilla stud cat, and no one had thought of trying to breed chinchillas, for whom, as before stated, there was no encouragement at shows or at home.

“The third litter which brought further fame to ‘Beauty’ was by ‘Bonny Boy,’ who in the early nineties was placed second in the class for silver tabbies at the Crystal Palace, but was considered by admirers of chinchillas to be the best cat in the whole show—an honour, however, which came to him a month later when at Brighton he was awarded the special for the most perfect specimen of the Persian breed in the exhibition; he had previously been claimed at Sydenham, by the Hon. Mrs. McLaren Morrison, at his catalogue price of £6 6s., and was afterwards renamed ‘Nizam.’

“The only information that could be obtained about this beautiful cat was that he was exhibited by Mrs. Davies and that he came from Wales. Report suggested that he was imported, but there is no evidence of any chinchilla cat having been sent from abroad.

[Illustration:

MRS. WELLBYE’S “SILVER LOTUS.”

(_Photo: E. Landor, Ealing._)]

“‘Beauty’s’ litter by ‘Nizam’ consisted of one male and four females, two of which, as ‘Twin and I’—so named because they were so exactly alike—won first prizes and medals wherever shown. Another was sold by me to Mrs. Martin, which, as ‘Lambkin Queen,’ was the foundation of the afterwards noted cattery at High Wycombe. ‘Twin’ eventually went to Mr. Lawton, who renamed her ‘Queen of the Mist.’ Mated with ‘Silver Lambkin’ she produced ‘Sea Foam,’ the first chinchilla to win a prize in a class solely confined to cats of the colour. There was an amusing coincidence about this win, inasmuch as after considerable trouble had been taken to get a separate class for chinchillas, the judge gave the first prize to a heavily marked silver tabby, thus totally ignoring the desired object. This occurred at the Crystal Palace in 1893 or 1894. The two first classes ever given for chinchillas were this one and that given at Cruft’s first cat show at Westminster, held in March, 1894.

“The next that was heard of ‘Twin’ was that she had succumbed from the effects of swallowing a needle. ‘I,’ registered as ‘I, Beauty’s Daughter,’ remained the whole of her lifetime at The Lodge, Penge, where, when paired with the pale blue ‘Champion Bundle,’ ‘Southampton Duchess’ was the result, the latter the mother of the ‘Silver Lambkin’s’ most sensational son ‘Champion Lord Southampton,’ who was sold by Mrs. Greenwood for £60, when he became the property of Lady Decies, this being probably the highest price that has ever been given in England for a cat of any variety. ‘Champion Lord Southampton,’ who has been a very great winner, is remarkable for the lightness of colour and slight markings of his kittens, this being undoubtedly due to the strain of blue in his blood. Many beautiful cats own him as sire, notably Miss Leake’s ‘Seraph,’ Mrs. Bluhm’s ‘Silver Sultan,’ Mrs. Neild’s ‘Absent-minded Beggar,’ Miss White Atkins’ ‘Tintagel,’ Mrs. Tyrwhitt Drake’s ‘Musa,’ Mrs. Rickett’s ‘Empress Josephine,’ Mrs. Earwaker’s ‘Buxton Cloud,’ Mrs. Geo. Walker’s ‘Woodheys Fitzroy,’ Mrs. Barnes’ ‘Nourmahal,’ winner of the Chinchilla Club

challenge for the best kitten, 1899, and a daughter of ‘Champion Fulmer Zaida,’ shown by Lady Decies at the Crystal Palace in 1901, also ‘Green-eyed Monster.’

[Illustration:

MRS. WELLBYE’S SILVER “DOSSIE.”

(_Photo: E. Landor, Ealing._)]

“Whilst speaking of ‘Tintagel’ it may be remembered that he sired a charming litter exhibited by Mrs. Poole, which were first at the National Cat Club show at the Crystal Palace, and one of which won as a single kitten at the Botanic Gardens in 1902.

“Other famous progeny of ‘Silver Lambkin’ are ‘Silver Mist,’ ‘Watership Cæsar’ (who won the gold medal at Boston, U.S.A., for the best cat in the show, 1902), ‘Silver Tod Sloan,’ ‘Silver Owl,’ Mrs. Bluhm’s ‘Silver Lily,’ ‘Silver Squire,’ and ‘Mowgli,’ the last-named bred by Mrs. Dunderdale, but later the property of Mrs. Smyth, of Forest Hill, one of the most enthusiastic admirers of chinchillas, who has in her possession the stuffed figure of ‘Beauty.’

“A chinchilla that gained a considerable notoriety was ‘Sweet Lavender,’ the property of Mr. Hawkins. This was a beautiful specimen, very light in colour. The latter was also a distinctive feature of the Hon. Mrs. McLaren Morrison’s ‘Ameer,’ a son of ‘Lambkin Queen,’ who stands prominently forward as one of the most perfect of his kind. Mrs. Martin’s ‘St. Anthony,’ whose name appears in the pedigrees of several winners, is a brother of ‘Ameer.’

“As the sire of Lady Decies’ ‘Champion Fulmer Zaida,’ the most lovely chinchilla female that has ever been seen, ‘Silver Laddie,’ who is now unfortunately gone to his happy hunting grounds, can claim to have been one of the most noted of sires, more particularly as he was also the father of many others of great value, prominent amongst which were Miss Horsman’s ‘Aramis,’ Miss Snell’s ‘Starlight,’ ‘Silver Cherub,’ ‘Lady of Quality’ (one of the most perfect chinchillas ever bred), ‘Charterhouse Pixie’ (the dam of ‘Tod Sloan’), and numberless others.

“Not only as a chinchilla, but when competing with all breeds of cats, both long and short-haired, ‘Champion Fulmer Zaida’ has proved her excellence, and has on more than one occasion secured the cup at the Crystal Palace for the best cat in the whole show. She was bred by Mrs. Bluhm, one of the pioneers of chinchillas, and, it is stated, has now won 136 first and special prizes, and that Lord Decies has refused £90 for her.

“‘Zaida’ has also produced some first-class kittens, amongst which was Miss Stisted’s ‘Pearl,’ the owner of the latter pretty queen being a most devoted admirer of the chinchilla and sparing no expense to further its interests.

“Mrs. Bluhm’s strain of chinchillas are all very light in colour, and show great quality, which may also be said of those of Mrs. Wellbye, whose ‘Silver Lotus’ and ‘Veronica,’ daughters of ‘Silver Squire’ and ‘Dossie,’ did so much winning in their day.

“Miss Meeson has also shown considerable enthusiasm in her endeavour to reach the ideal, her best efforts having resulted in ‘Jupiter Duvals,’ of wide fame.

“Two clubs have been formed in connection with the chinchilla cat—one, the Silver Society, embraced other coloured cats besides the chinchilla, this eventually becoming the Silver and Smoke Persian Cat Society. It was owing to this club encouraging shaded, or marked, silver cats and orange eyes that the Chinchilla Club was formed by Mrs. Balding. This Club has the honour of having as patron H.S.H. Princess Victoria of Schleswig-Holstein, who owns and exhibits some beautiful chinchillas, and Lord Decies as vice-president.

“The Chinchilla Club gives its support and specials, besides guaranteeing classes at any show whose management apply. The conditions on which the specials are presented is that the cats to which they are awarded must be the property of members of the club, prize-winners in their respective classes, and registered cats.

“The club prizes usually consist of half a guinea in each class, and the more coveted Special of the club’s badge for the best chinchilla of either sex. Badges were selected in place of the ubiquitous medal, because most of the dainty professional beauties very soon obtain a considerable number of the latter, and smart little badges were more appreciated.

“The club’s present challenge trophy for chinchilla kittens is a solid silver model of ‘Silver Lambkin,’ offered by the hon. secretary for competition amongst its members; it is also open to members of the National Cat Club, in acknowledgment of the compliment paid

by the latter to the original in choosing his statuette to surmount their challenge cup. The little history of the origin of this special has never appeared in print before, and as I was not present at the committee meeting referred to, ‘I tell the tale as ’twas told to me.’ When the challenge cups of the National Cat Club were designed in 1897, it was decided that the beauty and interest attached to them should be enhanced by immortalising on each the most representative cat of the long-haired and short-haired varieties. For the latter the great ‘Xenophon’ was chosen without hesitation. Then came the more difficult task of deciding upon a recipient for the distinction from the long-haired ranks, which claim so much of the beauty and wealth of winnings of the cat world as to render the singling out of one a matter of consideration. To hasten the termination of the discussion Mrs. Stennard Robinson sent for a collection of cat photographs which had been left to her by the late Miss Portman, the well-known ‘Rara Avis’ of the _Lady’s Pictorial_. Amongst these the hon. secretary of the N.C.C. pointed out one—with no name attached—as the most beautiful photograph of the lot. This was recognised by most of the committee as being ‘Silver Lambkin,’ so the honour fell to him.

[Illustration:

MRS. WELLBYE’S SILVER “VERONICA.”

(_Photo: E. Landor, Ealing._)]

“By some error at the makers’ the long-haired cat was placed on both challenge cups, and it was determined by the club that the superfluous model which had to be removed and replaced by ‘Xenophon’ should be mounted as a letter-weight and given as a challenge prize for kittens, to be won three times before becoming the property of the winner. After some keen competition, covering about half a dozen shows, Mrs. Martin won it outright in 1899, when it was replaced by the present exactly similar model.

“The endeavour of the Chinchilla Cat Club, of which all the leading breeders and most successful exhibitors are members, is to continue the work that has been done to improve chinchillas, and to produce a new variety the colour of the palest shade of the fur (dyed) known as ‘blue fox,’ or a very light shade of pigeon blue. Without doubt such a result can be obtained by careful selection and—‘the little more.’ Darwin’s words on the subject of selection are attractive to all owners of live stock. He says: ‘Improvement is by no means due to crossing different breeds. All the best breeders are strongly opposed to this practice, except sometimes amongst closely allied sub-breeds. And when a cross has been made, the closest selection is far more indispensable even than in ordinary cases. If selection consisted merely in separating some very distinct variety and breeding from it, the principle would be so obvious as to be hardly worth notice; but the importance consists in the great effect produced by the accumulation in one direction during successive generations of differences absolutely unappreciable by an uneducated eye. Not one man in a thousand has the accuracy of eye and judgment sufficient to become an eminent breeder.... Few would readily believe in the natural capacity and years of practice requisite to become even a skilful pigeon fancier.’

“The Chinchilla Cat Club is also prepared to encourage cats of new colours, which should now be not so very difficult to produce, considering the points that have been brought out in those varieties that were well known, the latter showing that it is possible to breed to a standard if judgment is used in the endeavour to do so. Some of us remember the time when a blue cat, either long or short-haired (now the largest classes), was a _rara avis_ when Mrs. Lee’s ‘Meo’ was the only Siamese at the Crystal Palace show, smokes an equal oddity, blue eyes in a white cat a comparatively unnoticed point, and cream-coloured cats entirely unknown.

“The colour of the chinchilla has been bred in various ways. In bygone days, when chinchilla cats were flukes or freaks and few and far between, methods which would now be considered somewhat eccentric were resorted to by the first breeders of the colour. The useful tortoiseshell, from which black, red, cream, or tabby cats can be got, was pressed into the service, and, paired with a silver or light blue tabby not too clearly marked, would occasionally, amid the multi-coloured kittens for which tortoiseshells are proverbial, throw a medium chinchilla or light silver tabby, which with careful selection might, a generation or two later, develop into something approaching a good chinchilla.

“But it is, perhaps, more difficult to foretell with cats than any other animal what the result of pairing will be with anything like certainty. This particularly applies to the ordinary English cat, as it is impossible to guess at the mixture of different-coloured creatures which have preceded it, and any of which may influence the progeny of its descendants. A fancier who would produce any particular specimen must, amongst other gifts, be equipped with the patience of biblical celebrities and prepared to wait seven years, as one enthusiast actually did before arriving at the fulfilment of his desires in the shape of a well-marked tabby kitten.

[Illustration:

[Illustration:

MRS. WALKER VISITING HER PETS.

TWO VIEWS OF WOODHEYS CATTERY.]

“With pedigree cats, of course, the chances of unexpected traits reappearing in their progeny are considerably lessened, and, given desirable connections on both sides of some years’ standing, the personal attributes of a coming litter may be predicted more or less successfully. One of the loveliest of smokes—the correct black, with white under-coat, without the shadow of a stripe—was from a brown tabby queen, from brown tabby parents, and a chinchilla bred from a chinchilla dam and smoke sire. Again, a brown tabby with white paws, whose appearance did not suggest the bluest of blood, mated with the same chinchilla sire, produced in a litter three chinchillas and two faintly marked silver tabbies, which would nowadays have been styled ‘shaded silvers’ by followers of the dubious hue. Needless to say, these instances are not given to encourage the idea of breeding chinchillas from brown tabbies, but as illustrations that just as the results of pairing a cat with one of nondescript pedigree cannot be guessed, so in an animal carefully bred for generations so indelibly have the characteristics of the breed or variety been stamped upon it by past ancestors that it is practically impossible for them to become obliterated or submerged.

[Illustration:

“SILVER BLOSSOM.”

OWNED BY MRS. WALKER. (_Photo: Findlow & Co., High Wycombe._)]

“Thus the type once fixed survives, though it be by the aid of the most incongruous connection, such as a brown tabby. Had the latter been the patrician bred from progenitors of her colours, and the chinchilla been the one of doubtful lineage, the result must, of course, have been reversed, and the kittens, in all probability, would have followed the brown tabby strain. If neither parent cat when of distinct varieties can boast a particularly dominant strain, the offspring naturally partakes of the peculiarities of both.

“Colour, in chinchillas, is the most important point. It should be of palest silver, lavender tint, and lighter—in fact, practically white—at the roots. There should be no dark blotches or stripes or brown tint on the back or about the nose. A rusty hue is, however, sometimes caused by the action of the sun or wind. As regards bars or stripes on head, these should be as few and light in colour as possible, with a view to breeding them out altogether in the future.

“The coat should be long and thick, of fine, soft texture, much thicker and longer round the neck, forming a decided frill and mane, the latter reaching well down the fore legs. It should also be longer on the hinder part of the thighs, forming _culotte_, and very bushy on the tail, which should be short and wide. The legs should be slightly feathered, with tufts of hair between the toes. There should also be tufts in the ears, which should be very small and set low.

“The head should be wide at the forehead and short in the muzzle, well filled up below the eyes, giving it a round appearance. The eyes large and luminous, in colour emerald green with black lids. Green and yellow mixture is permissible, but not so picturesque as the green; yellow in the eyes is not desirable. In shape the chinchilla should have a level back, and be only slightly long in the couplings. The legs should be short, with round paws, the latter well padded. When in full coat the hair should nearly reach the ground and the frill envelop the back of the head, making a very fascinating whole.”

The following is the standard of points as drawn up by the Chinchilla Cat Club. It is also used in America as a basis for criticism:—

1. Colour of Coat.—Palest silver, lavender tint preferred, nearly white at roots. No dark stripes, blotches, or brown tint. Darker tips to the long-hairs give the coat an appearance of being lightly peppered with a darker shade. The whole appearance of the cat to be very pale 30 2. Coat.—Long and thick 20 3. Texture of Coat.—Fine and soft 10 4. Tufts of hair inside and round the ears and between the toes 10 5. Head.—Broad and round; forehead wide, ears small and set low, nose short 25 6. Shape.—Back level, not too short; legs short, paws round; brush short, wide, and carried low 20 7. Eyes.—Large, luminous, and green in colour (if green mixed with yellow, 5 points only allowed) 10

To breeders of silver Persian cats an article by Mrs. Neild will be valuable and instructive. Mrs. Neild has made, so to speak, a speciality of silvers, and owns two noted silver studs—the “Absent-minded Beggar” and “Lord Hampton.” There are always some good silver queens, and very frequently some choice kits, disporting themselves in the well-arranged catteries at Hart Hill, Bowdon, where Mrs. Neild has a kennel of Borzois and a cattery of silvers.

This is what Mrs. Neild says regarding the breeding and rearing of silver Persian cats:—

“Perhaps of the many varieties Persian cats—and, indeed, they are a goodly number as they now appear on our show catalogues and schedules—the silvers may claim their owners to be the most sporting of cat breeders. Certainly, to breed successfully it is essential that one should possess the not too common virtues of unlimited patience and perseverance. Also experience is necessary.

“A common occurrence among even old hands is to assign a kitten—one of a new litter under inspection, as being of ‘little good except as a pet’—‘to be sold at a small sum to a good home,’ and a few weeks later discover this same kitten to be the pick of the litter. In short, the old, old story of the ugly duckling incessantly repeats itself in our catteries, certainly in those devoted to silver cats. Therefore I suspect fanciers who have succeeded (all honour to the few!) and those who mean to succeed in breeding silver Persian cats of possessing a larger stock of patience and of having acquired a larger experience than their brothers and sisters whose love has turned towards the blue, black, or white pussies.

[Illustration:

“SILVER BLOSSOM’S” TWO BUDS.

(_Photo: Mrs. G. H. Walker._)]

“With these last three one may be tolerably sure—always taking for granted some knowledge—of fairly pure coat colour, and at a very early age the best kittens of the litter may be picked out—those having greatest breadth of skull, smallest ears, etc. But the silver litters are a veritable surprise packet, and remain so for an irritatingly long period. Personally, I have found that those kittens which, when born, have very pale—almost white—unbarred faces and fore legs are ultimately those which grow palest. I take no notice of the colour of the coat on the back, sides, hind legs, or tail, even if striped, as frequently happens, for all these markings generally vanish _if_—as I before said—the face and fore legs are unbarred. I must, however, own to one kitten who was born jet black. She was by Mrs. Champion’s ‘Lord Argent’ and a shaded silver queen of my own breeding. When a month old I dubbed her a very bad smoke; at three months she was coatless—a most indecent little person, having shed her coat more completely than I had ever seen in cat or kitten. When, after a provokingly long period, she again consented to appear clothed, her dress was of palest silver, unadorned by any markings except a very faint smudge on her forehead and—which, alas, spoilt her for show—a darker tinge on her broken tail. How is it that to our _best_ some accident _always_ happens? So, as I could not exhibit her, I sold her to a delightful home in the North of England, and her enthusiastic owner wrote to me a few weeks since that her big babies by ‘Lord Hampton’ were as pale as the mother, who herself grew steadily of a fainter silver.

[Illustration:

“WILD TOM.”

SILVER, BRED BY MRS. G. H. WALKER. (_Photo: Mrs. G. H. Walker._)]

“Unfortunately, silvers more than any other breed of cats lack bone, caused, of course, by the unavoidable in-breeding practised when this variety of cat was first introduced and so enthusiastically welcomed, and when but one or two fanciers owned a cat of such shade. Another article on this subject, by a lady who may really claim to have established this breed, will explain to the reader more than it is in my power or province to declare.

“To go back to the subject of our small silvers, in-bred to delicacy. We should now remember how many good sires, absolutely unrelated and within easy reach, are placed at our disposal. Therefore, surely there can be no possible excuse if in a comparatively short time we do not manage to own silvers big in bone and limb, and owning—ah! happy accompaniment—greater constitutional vigour.

“We are, I believe, too apt, if owning a pale queen, to mate her with the palest known stud, disregarding other very important considerations in the all-absorbing wish to breed the wonderful ‘dirty white’ king or queen of silvers. Sometimes this atom (verily so) of perfection does make its appearance, and is enthusiastically greeted. But what of the mite itself? A tiny, sickly scrap of a kitten, constantly ailing, refusing to grow or to weigh, except at a rate of less than half the average blue kitten of its own age. But extraordinary care keeps the mite alive until one day some chance draught or a maid’s carelessness ends our careful nursing, and the poor owner of that ‘lovely dirty white kit’ at last realises that this other good-bye means it may be wiser to mate that same pale queen to the strongest, hardiest, biggest-boned stud possible to be found among our silver studs, even if he is rather barred.

“Now mark. From the result of this mating, keep the best of the female kittens and marry her—if possible, not before she is eighteen (at any rate, fifteen) months old—to a stud unrelated, sturdy, of undoubtedly splendid health, for preference paler than herself, and boasting grand head and the essential tiny ears and short nose. Then you may dream your dreams with a chance of their resulting in a golden reality.

“If breeders would but spend rather more thought when they select husbands for their pussies, they would be indeed repaid. I am not speaking, of course, to the fortunate few who have won their laurels, and of whom I would I might learn; although I rather suspect their secret of success is but the result of continual study, coupled with extreme care. Would not an enormous increase of size and weight soon become evident in the occupants of our catteries if, when a queen was about to be mated, her owner would first carefully study the list of points provided by the Silver and Smoke Persian Cat Society (previously quoted in this work), jotting down those good qualities to which she believes her queen may lay claim, and then selecting that sire possessing the points most wanting in her own cat—of course, never forgetting relationship? The old rule about in-breeding is ‘once in, twice out,’ as all old fanciers know; but where silver Persian cats are in question, I would most strongly urge that this adage be disregarded, and, as a rule, avoid in-breeding entirely until a stronger race of silver cats is established, cats with frames equal to those big blue beauties we see at our shows. I think that in a comparatively short time—of course, always avoiding tabby blood, breeding _chiefly_ for bone—our silver cats may be very different to those of to-day, those who own too fairylike limbs to be beautiful.

“A word about our famous sires—and, by the way, we may congratulate ourselves on having within reach so many beauties. Often I have letters asking for advice as to which stud such and such a queen shall visit; and, in addition to the above suggestions, I would remind the owner that length of journey should be taken into consideration, and the fact that if the chosen sire is extremely popular it may be that a better result may be gained if the queen is sent to one not so much in request, especially if the owner of the stud cat has not been warned before of the visit of your pussie. However, most owners of stud cats are extremely careful in limiting the number of visitors, and few object to keeping Sir Thomas free for a week beforehand if given due notice.

“Do let me urge all whom it may concern to keep Madame in close confinement for several days after her return home. Indeed, in the interest of the owner of both stud and queen this is of vast importance, and many a disappointment is due to this seemingly small neglect. Puss does not always return as one would wish, however great the care given her whilst away on her holiday, and may take her matrimonial affairs into her own paws with results most unsatisfactory to everyone but herself. When the kits arrive, do not—if you have reason to expect valuable kittens as a result of the mating—leave more than two or three with the mother (I am, of course, speaking of silver kittens) for reasons I shall directly state. By far the best plan is to procure (some time before the birth of both litters) a good big English cat as foster mother, one known to have brought up a previous litter—_not_ an old cat. The usual method of substituting her foster for her own babies is to take away the mother cat for a few minutes—of course, out of sight—and, removing one of her own kittens, rub the little silver baby with the hay of the nest and against the other kittens so that the strange smell—sense of all others so wonderfully developed in animals—may not raise suspicion in the foster mother. Then the next day remove one or two more.

“May I, at this point, plead that the little kittens taken from their mother for your benefit should not be drowned? If they must be sent along the silent road to the Quiet City, let it be done mercifully and by chloroform. Such wee things may rest easily in a big biscuit box, the lids of which usually close tightly, and about 1 oz. of chloroform poured on a piece of flannel or sponge laid on a small saucer by their side will send them painlessly to sleep.

“The reason I strongly advise that the English foster should nurse the _best_ of the litter is but an echo of the old cry, ‘Want of bone.’ Fed by the sturdy British puss, the delicate tiny balls of silver fluff will gain greater strength, and be mothered for a longer period than would be possible with their real parent.

[Illustration:

“FUR AND FEATHER.”

(_Photo: Mrs. S. F. Clarke_)]

“It is necessary to remember that, although the foster mother needs extra food when nursing—just as in the case of the silver mother—more caution must be exercised when beginning the more liberal diet, for very probably, if this is forgotten, a liver attack—which will also affect the precious kits—will be the result of her unusually liberal fare. Remember, also, to inquire of the owner of your foster as to how she has been fed. With this knowledge, common sense and careful watching of cat and kittens will

quickly show if it would be better to increase or diminish her meals either in quantity or quality. It is of enormous value to bespeak the foster mother, if possible, four or five weeks before the birth of the kittens, for then it will not hurt to give her what is almost certain to be necessary—_i.e._ a worm powder.

“I always allow my mother pussies as much milk as they like (although, as a rule, my cats drink water), but it should be boiled, and one tablespoonful of lime-water added to each half-pint. When I once urged this care of the foster mother to a friend who owned two kittens she was extremely anxious to rear, I was laughed to scorn, and assured that such fussiness about a strong English cat was more than foolish. Yet I would remind breeders who are inclined to agree with the above opinion that on the perfect health of your head nurse rests the future of your much-prized litter. On her depends their growth, their first chance of throwing off their natural delicacy. Mr. House, in one of his articles lately published in _Fur and Feather_, advises that kittens should be kept with and fed by their mothers as long as sixteen weeks. In my humble opinion this is too great a strain on any Persian cat, but there may be great wisdom in keeping the kits with the mother or foster for as long as it is possible without overtaxing the cat. The same authority speaks of a relay of foster mothers. I confess this puzzles me, for I should imagine that the food supplied by the second mother would be too weak in quality (as Nature provides it shall be of different quality to suit the age of all and every kind of baby) for the big kits after that of the first foster, and I should have also imagined the second foster would refuse to nurse kits so much bigger than those she had just left.

“When my kits are four weeks old I give them raw lean beef—scraped, not chopped—beginning with half a teaspoonful daily, then the same quantity twice daily, then three times a day; and at the same time teach them to lap, using a plate, which, being shallower than a saucer, causes less choking and fear to the little things.”

Mrs. G. H. Walker, of Woodheys Park, is the chief supporter of the Northern Counties Cat Club, and is a member of the National Cat Club Committee. For several years she has been a well-known breeder and exhibitor of silver Persians, and has a most excellently planned cattery, which I had the pleasure of seeing when on a visit to Woodheys Grange. Mrs. Walker kindly had some views taken, specially for reproduction in these pages. I consider the arrangements for the pussies’ comfort and well-being as complete as it is possible to make them. The floors of the outside catteries, which face south, are cemented, so that they can be washed over every day. The roofs are boarded, and then covered with galvanised iron, so that all the rain runs away easily. The spacious apartments are fitted with benches and ledges, and trunks of trees and leafy shrubs are planted in the ground for the cats’ special amusement and exercise. The kennels—which, for the purpose of photographing them have been placed outside—are the cosy sleeping dens of the pussies. There is a maid in attendance on these fortunate cats, and the man who looks after the kennels of dogs also gives a helping hand.

[Illustration:

“THE SILVER LAMBKINS.”

BY “RAHMAN” _ex_ “BEAUTY.”]

In one of the pictures will be seen a staircase, and this leads to three charmingly arranged rooms. All the appliances and utensils connected with the animals are kept in one of these apartments. Another is set apart for mothers and their families, and a third is kept in case of illness for an isolation ward. In one of the loose boxes near at hand the cooking for the pussies is carried on, and there is a larder specially for the cats’ food. Mrs. Walker devotes much of her time to looking after her pets, and great has been her sorrow over the untimely death of some of her treasured pussies. After one of the large shows, infection crept into her cattery, and worked most cruel havoc. Such losses as Mrs. Walker sustained were enough to damp the ardour of the most enthusiastic cat lover and fancier; but the lady of Woodheys Grange bravely faced the situation, and after a period of sad reflection she once again resumed her hobby with renewed interest. At the Northern Counties Cat Show at Manchester in 1902 Mrs. Walker exhibited a really wonderful silver kitten. I say wonderful, for this youngster, bred from the owner’s “Woodheys Fitzroy” and “Countess,” was the most unshaded and unmarked specimen of a silver I have ever seen. This unique specimen will be watched with interest by silver fanciers. May his shadings ever grow less!

The average number of inmates of this cattery is about thirty, but at one period of Mrs. G. H. Walker’s catty career the silver fever ran high, and there were sixty-three cats and kits within the precincts of the spacious and luxurious catteries of Woodheys Grange.

Mrs. Martin, of High Wycombe, who has often acted as judge, has been a most successful breeder of silvers, and the progeny by “St. Anthony,” her noted sire, have distinguished themselves by winning over one hundred prizes. “St. Anthony” has retired into

private life, but he will always be remembered if only by his two children “Silver Dove” and “Fascination.” Mrs. Martin says, “I am all in favour of the male being older than the queen in breeding silvers; also select a good-coated stud cat, short in the legs. Eyes are a worry just now. Of course, I like green best, but if a cat is good in all points but colour of eye, this should not upset an award. I find that if a kitten is born almost self silver, it will develop into an indifferent silver tabby later; but if the body is dark, and head and legs light and clear, you may hope for a very unmarked specimen in due time.”

Mrs. Wellbye’s silver cats “Dossie,” “Silver Lotus,” and “Veronica” were at one time well-known winners, and for length of coat and beauty of eye have seldom been surpassed. Mrs. Wellbye is a most astute judge of silvers, and her remarks on this her favourite breed will be read with interest:—

“This handsome variety of the Persian ranks high in the estimation of cat lovers; indeed, its ardent admirers consider it the _crème de la crème_ of the cat world. And why not? Surely there is nothing to compare with a lovely young chinchilla Persian in full coat. Its very daintiness and seeming pride in itself is quite charming. One is reminded of a pretty child dressed out in its party frock, for puss appears to know it is well dressed and desirous to show her charms to the best advantage. She dances, pirouettes, and throws herself into the most graceful and entrancing attitudes, until we feel in sympathy with the Egyptians of old and are willing to fall down and worship our adorable pets. We all love beauty, but to those who love cats there is something beyond even beauty, for only they who keep and care and treat them well know the comfort these little creatures are, and the happiness they can bestow by their sweet caressing ways, perhaps more especially to those whose hearts are starved of human love, but still to all whose sympathies are wide of the varieties of silver cats. I will first treat of the chinchilla.

“The Crystal Palace show of 1895 or 1896 was the first I remember with a class for chinchillas; previous to that, I believe, they were not recognised as such, but were shown with the silver tabbies. Strictly speaking, the name chinchilla is a misnomer as applied to these cats. The soft grey coat of the little animal called the chinchilla, whose lovely fur is so much prized as an article of ladies’ dress, differs diametrically from the cat so-called.

“The fur of the chinchilla is dark at the roots, and shades quite pale grey at the tips. The cat’s fur, on the contrary, is absolutely pale grey, almost white at the roots, but tipped with black at the outer edges.

“The points as laid down by the Silver Society are as follow: ‘Chinchillas should be as pale and unmarked silver as it is possible to breed them.’

“The aim of the breeder of this variety, therefore, is to obtain a cat with none of the markings of the original stock (the silver tabby), the dark tippings to be slight and faint.

[Illustration:

BROWN TABBY AND SILVER PERSIANS.

(_From a Painting by Miss F. Marks._)]

“Breeders have found this ideal most difficult to obtain; although some kittens are born pale all over, with no markings, in a few weeks—or maybe months—the hope of the family is no more, for the lighter the kitten the more delicate. ‘Whom the gods love, die young.’ Or, again, if the cherished one lives over its baby troubles, and starts on the change from its first, or kitten coat, to the second coat, too often do the markings appear, the shadings get darker, or fine black hairs are seen amongst the pale grey. Some of the best chinchilla kittens have been born quite dark, and with tiny stripes all over. At a month or six weeks these marks have disappeared, and later the coat has become an even silver.

“The breeder must not even then build high hopes. Again change may occur. There is no cat which varies so much; it is quite chameleon-like in this respect.

“A few years ago the Cat Club adopted the name of ‘self silver’ as applied to the chinchilla—another misnomer, as a self silver should have no tippings or shadings, and the silver cat has not been bred that had fur the same shade throughout from roots to tips.

“The slight dark edging to the fur constitutes to most people the charm in these silvers. Sometimes it is almost imperceptible to the casual observer; or when the cat is in full coat (the fur being from three to seven inches long on the tail—sometimes as much as nine inches) the tiny fleckings are lost in wavy, tossing, billowy coat. But let the coat become damp, however slightly, it will be seen that the dark edges are clearly in evidence.

[Illustration:

“JUPITER DUVALS.”

OWNED AND BRED BY MISS S. MEESON. (_Photo: F. Parsons, Southend-on-Sea._)]

“As, however, breeders could not always produce the pale shade of silver, the litters, even with the most careful mating, being generally assorted in good, bad, and indifferent so far as colour was concerned, many fine cats—dark silvers—had no place assigned to them.

“It was then suggested that a class should be given at the shows to be called ‘shaded silver,’ the points according to the Silver Society being as follows:—

“‘Shaded silvers should be defined as pale, clear silver, shaded on face, legs, and back, but having as few tabby markings as possible.’

“The dark or shaded silvers, it was understood, should have pale, clear under-coats; but instead of the fleckings of the self silver (so-called), the dark edges ran a considerable way into the fur. The shaded silver is a handsome cat, but too often much marked on the face and barred on the legs, a defect most difficult to overcome. Many cat fanciers describe the shaded silver as a ‘spoilt tabby.’

[Illustration:

THE ELDER MISS BLOSSOM.

SILVER, OWNED BY MISS HORSMAN.]

“The third in the group of silvers is the silver tabby. The points are here stated:—

“‘The colour of a silver tabby should be a pale, clear silver, with distinct black markings.’

“This variety ought in equity to have been mentioned first, as it is the original stock, but it has been overshadowed by the superior attractions of the chinchilla. (Silver tabby enthusiasts will perhaps pardon this eulogy of my favourite breed.) There is not the slightest doubt this handsome cat, the silver tabby, has suffered materially from the craze for the newer variety, and consequently the type has not been kept pure. They have been mated over and over again with cats of less markings in the hope of breeding chinchillas, until at the present day there are very few silver tabbies true to type.

“The position of the silver tabby in the feline scale is very peculiar. As a Persian it is, of course, necessary that its coat should be long and fine, whilst as a tabby it is desirable that the markings should show up to advantage. How to reconcile the two is the puzzle, for the longer the coat the less the markings are evident, as the stripes are merged in the flowing coat, so that we sometimes see at the cat shows exhibits woefully out of coat placed in the first rank, as the markings are much more distinct. It follows, then, in this variety of the silver, a long coat is distinctly a disadvantage when competing at shows.

“Having now obtained three types for silvers, and the Cat Club willing to give classes for them at the great shows held in St. Stephen’s Hall, Westminster, the outcome was looked forward to with much interest. But it was one thing to get four types, and quite another matter to get silver breeders to understand the fine distinction; consequently, the cats were entered in self silver, shaded silver, and silver tabby classes indiscriminately. The result was, of course, muddle and confusion, many exhibitors having the mortification of finding ‘Wrong Class’ on the cat pens.

“At a recent show held at Westminster under the auspices of the Cat Club, the judge was asked by the Honorary Secretary to go round the classes first, and if any exhibit was wrongly placed to re-classify before judging. This worked satisfactorily so far as disqualification was concerned.

“At this show, however, the judge was confronted with another difficulty, it being found that most of the cats in the classes for shaded silver had deviated materially from the standard of points laid down by the Silver Society. Instead of the clear, pale under-coat, the fur was a dark grey right down to the skin. The majority of these cats were quite dark, and, rightly speaking, were not silvers—that is, if one bears in mind the metal so named. It is difficult to say in what class they could be placed, unless a new class was created, to be called ‘clouded or oxydised silver.’ If we go on to these subdivisions we shall not know where to stop. Self silver or chinchilla, shaded silver, clouded silver, and silver tabby—a truly appalling problem for the bewildered judge to decide, for the majority of exhibitors would not appreciate the variations.

“It may come to this eventually, but at the present time the threefold classification leads to much confusion, for as nearly—or very nearly—all silver cats are more or less tabby marked, so will exhibitors be in doubt as to the class to which their cats rightly belong.

“It is a question if the introduction of the shaded class at shows has not done more harm than good, for as previously we saw very few of the dark silvers—it not being worth breeding the variety when there was no class in which to show them—so now the tendency of exhibits, as anyone who attends shows can see, is to run to darkness rather than light; and breeding for colour, purity of colour, and absence of markings has received a set-back, for with some judges colour is nothing, and prizes will be showered upon a ‘spoilt tabby’ if it happens to have, perhaps, a broader head or a bulkier body—good points, as everyone will allow, but points which the common or garden cat may possess; and we do not pit our dainty chinchillas against all and sundry.

“Without wishing in any way to detract from the good qualities which the more plebeian branches of the cat tribe undoubtedly possess, it is impossible not to award the palm for grace and beauty to the highly bred aristocratic chinchilla. Coal and iron are useful, but we give our admiration to diamonds and pearls.”

[Illustration:

“DOLLY DAYDREAM.”

(_Photo: E. Landor, Ealing._)]

Before closing the chapter on silvers, I will allude to the Cat Club show held at St. Stephen’s Hall, Westminster Aquarium, in January, 1903. On this occasion there was quite a record entry in the male silver class, which contained twenty-one cats. The list was headed by Mr. J. F. Dewar’s handsome “Father O’Flynn II.” Many well-known prize-winners had to be content with a V.H.C. card in this class of quantity and quality. The females numbered eighteen, and here again a noted winner was awarded the highest honours. Miss Chamberlayne’s “Cap and Bells” is very pale and pure in colour, and carries a soft, silky coat. In the silver kitten class the sexes were not divided, and Miss Ford’s lovely kittens scored first and third. A sweeter face and rounder head than that possessed by “Silver Button,” the first prize-winner, would be difficult to find, and Miss Ford may be congratulated on having bred such a gem. Mr. T. B. Mason judged the silver classes at this show, and he doubtless experienced some difficulty in testing the colour of the exhibits in the bad light of St. Stephen’s Hall, more especially as on the opening day of the show a dense fog hung over the city. Another difficulty which must present itself to our most capable judges is the awarding of specials offered for silvers and shaded silvers. Perhaps the easiest way out of this difficulty is to give the shaded silver prizes to the darkest cats; but all are shaded, even the palest, and therefore some judges might justify themselves if they awarded both sets of specials to the one cat. At this show Lady Marcus Beresford offered three special prizes in each silver cat class for the palest specimens, one of these in the male class being won by her own handsome “Beetle,” a son of the famous “Lord Southampton.” The classification for silvers at the specialist societies’ show at Bath, which followed close after the Westminster show, was the largest that has ever been given, consisting of classes for novices and breeders, in addition to the ordinary division and subdivision for cats and kittens. The sensible plan of a ring class for neuters _only_ was adopted.

Members of the specialist society for the encouragement of silvers must on this occasion have felt proud of the liberal classification and of the long list of handsome special prizes offered for their favourite breed of long-haired cats.

SILVER TABBY, OWNED BY MISS ANDERSON LEAKE. (_Photo: Cassell & Company, Limited._)]

CHAPTER XIII. SILVER TABBY PERSIANS.

There can be no question that a really good silver tabby will carry off the palm even from the most exquisite unmarked silver cat, and in this assertion I feel I have the support of all our professional judges, for with the “mere man,” it is well known, the pale silvers

do not stand high in favour. Men call them “wishy-washy,” insipid, and wanting in expression, and are generally displeased at this sport in the fancy that has spoiled the handsome silver tabbies of years gone by.

No doubt there is just cause for complaint, for the inter-breeding of silvers with silver tabbies has undoubtedly done much to destroy the clear defined markings which in tabby cats is their chief glory. Now, of course, it is easily understood that these tabby markings in a long-haired cat cannot be so distinct as those that appear to such advantage in the short-haired breeds. “The better the coat the weaker the markings,” may be said of Persian silver tabbies, and judges have been known to give the highest award to an out-of-coat specimen just because the markings are more evident than in a cat in full pelage. Harrison Weir states that “Tabby is not a Persian colour,” and goes on to say, “Nor have I ever seen an imported cat of that colour.” His definition of a silver tabby reads thus:—“Markings: Jet-black lines, not too broad, scarcely so wide as the ground colour shown between, so as to give a light and brilliant effect. When the black lines are broader than the colour space, it is a defect, being then black marked with colour, instead of colour with black. The lines must be clear, sharp, and well defined, in every way distinct, having no mixture of the ground colour. Head and legs marked regularly, the rings on the throat and chest being in no way blurred or broken, but clear, graceful, and continuous; lips, cushions of feet, and the backs of hind legs, and the ear points, black.” And here it will be interesting to give the discussion which took place and the list of points drawn up at the inaugural meeting of the Silver Society in 1900, and which standard is still adhered to in the present Silver and Smoke Persian Cat Society:—

SILVER TABBIES.

At the meeting of the Silver Society, discussion arose as to whether the markings on silver tabbies should be broad or narrow. Lady Marcus Beresford proposed that Miss Leake and Mrs. Herring should be asked to express an opinion, both being breeders of prize-winners. Miss Leake said she thought there were two distinct types of cats, the one with broad markings, the other with narrow stripes, and that both were correct silver tabbies, the superior beauty of either being a matter of personal opinion. Mrs. Herring agreed, and said the markings should be a dense black. Miss Leake considered they should be black at the tips, but shading to light at the roots. Mr. Abbott objected to the word “dense,” as black was black, and the word “distinct” was substituted. Finally the following was resolved:—The colour of a silver tabby should be a pale clear silver, with distinct black markings, any brown or cream tinge to be considered detrimental. The eyes should be orange or green:

Head and expression 25 Colour and markings 25 Colour of eyes 5 Coat and condition 20 Shape 15 Brush 10 ——— Total 100

The adoption of the preceding descriptions and scale of points as a whole was carried unanimously.

[Illustration:

MISS LEAKE’S SUMMER CATTERY.

(_Photo: Cassell & Company, Limited._)]

As regards the eyes of a silver tabby, Harrison Weir says “deep bright yellow.” The Silver Society gives an option of “orange or green”; but the mandate of present-day fashion and personal bias is in favour of green eyes for silver tabbies. From an artistic point of view, there is no doubt emerald green is a better contrast to silver than yellow or orange.

The Rev. R. Maynard, whose name has for many years been connected with silver tabbies, recently complained in the papers of the tendency to breed green eyes in this variety. He writes: “In former days we never had anything to do with a cat that had green eyes, and now that so much is being done to improve the feline race, why should we try to think the green eye right and even desirable?” Another authority says: “The fiat has gone forth that silver tabbies are to have green eyes. Happily there still remains room for a difference of opinion on the subject, for the oldest and most perfect breeds of silver tabbies have always been distinguished by their deep hazel eyes.”

[Illustration:

SILVER TABBY KITTENS OWNED BY H.H. THE PRINCESS VICTORIA OF SCHLESWIG-HOLSTEIN.

(_Photo: E. Landor, Ealing._)]

This vexed question of eyes, certainly outside the “self” classes, ought not to be one of such vast importance. As Louis Wain aptly writes when complaining of this undue proportion of points, “Everyone, judges and exhibitors alike, are bitten by the craze for the

‘correct coloured eyes.’” It is a fault that judges are prone to commit, and truly one point ought not to be allowed to outweigh others, and it is just this balancing of merits with a mingling of common sense that makes the good all-round judge, whether of self or tabbies, of long- or short-haired cats. In judging a class of tabbies, first and foremost in the judge’s estimation must rank the markings, and in Persian tabbies coat must next be taken into consideration. I have always thought that judging long-haired tabby cats in a ring class would be specially welcomed both by judges and exhibitors, for it is when a good cat of this breed runs or walks the beauty of his markings can be seen and admired. Then the dark spine lines will show up to advantage, the side markings will stand out, and the bars on the legs and the rings round the neck may be clearly discerned. I think it is not to be wondered at that fanciers who have bred tabby cats are not easily satisfied as regards selfs and silvers. A friend of mine declared, “I always miss the stripes which give a tabby cat such a sweetly expressive countenance.” Yet in spite of the beauty of the silver tabby, there are very few fanciers of this variety, and to those wishing to take up Persians I could not recommend a more interesting field for speculative breeding. The number of good show specimens can be counted on the fingers of one hand. Silver Tabby classes at our shows are full of nondescript cats with shaded silver bodies and markings only on legs and head.

When judging the silver tabbies at the Crystal Palace in 1902, I was greatly struck with the number of cats and kittens which ought really to have been marked “Wrong Class,” for some of these were absolutely wanting in any definite marks at all; some had faint grey pencilling on the head and legs, but not a sign of the dense mottling on the sides. It is, no doubt, disappointing to exhibitors to have their specimens labelled “Wrong Class,” or for really lovely kittens to be passed over without even a card; but it is only by thus treating exhibits so lacking in the essential point of the class for which they are entered that fanciers will learn to discern between the genuine article and what may be called a spurious one. These pretty nondescript silvers, which are neither one thing nor the other, should be disposed of as pets; but to enter them at our shows in classes for tabbies is only throwing away money and risking the animals. No cat has come nearer to the perfect ideal of a silver tabby in our day than Lady Pink’s “Shrover II.,” now gathered to his fathers. He possessed the wonderfully clear silvery white ground with distinct dark markings, and was always the admired of all admirers at our leading shows. Lady Pink is not without some worthy descendants of her famous “Shrover II.,” and writes to me thus: “I have a smoke male by ‘Shrover II.,’ and hope to show him at Westminster. ‘Shrover III.’ is just like his father ‘Shrover II.,’ but I shall not exhibit him, as I am too afraid of losing him. I have suffered many losses after shows. ‘Shrover III.’ is a fine, big fellow, even better marked than his father, with long silky, wavy coat, lovely eyes, and a perfect temper.”

[Illustration:

“BEAUTIFUL DUCHESS.”

OWNED BY MRS. G. H. WALKER.]

[Illustration:

WINTER QUARTERS AT DINGLEY HILL.

(_Photo: Cassell & Company, Limited._)]

Mrs. Herring has bred some fine silver tabbies, notably “Duchess Lestock,” a sensational kitten at the Westminster show of 1900, when she was claimed at a high price by Mrs. G. H. Walker, of Woodheys Park. Mrs. Herring’s “King Alfred” was the sire of “Shrover II.,” and is quite “one of the best.” Miss Anderson Leake is justly celebrated as a most enthusiastic and successful breeder of silver tabbies, and is our greatest authority on this variety, As far back as 1887 “Topso of Dingley” was exhibited by Miss Leake at the Crystal Palace. This cat was said to be of Irish descent, but his ancestors were sunk in oblivion. Not so, however, his progeny, for the winnings of his son “Champion Felix,” owned by Miss F. Moore, of Beckenham, are fresh in the minds of those who, like myself, can remember beautiful cats of bygone years. In 1889 Miss Leake entered “Topso” and two toms in a class for “blue or silver tabbies, with or without white.” “Felix” was also in this class, as a winner of the Challenge Cup. Miss A. Leake’s “Abdul Zaphir” and the present representatives of the breed “Abdul Hamet” and “Marquis of Dingley” are household names amongst silver tabby fanciers. Miss Derby Hyde has long been faithful to this breed, and “Thames Valley Silver King” and “King Alfred” have often had to fight it out together at our shows, sometimes one being favoured by the judge and sometimes the other carrying off the honours. Miss Cope has recently been bitten with the silver fever, and her tabby kittens are always to the fore. Her “Roiall Fluffball” took first and seven specials at Westminster in 1901, and her “Silver Tangle” is a well-known winner. Mr. Furze, another Midland fancier, is also making a speciality of silver tabbies, and the Hon. P. Wodehouse possesses a fine silver tabby female in “Silver Saint.” Mrs. Slingsby owns “Don Pedro,” a beautiful specimen, and Miss Meeson has bred some good silver tabbies as well as silvers. But the ranks need filling, and with the assistance of the society now in existence the classification at

shows will become more liberal, and instead of silvers and browns being often placed together at our smaller shows, separate classes are guaranteed, for it is certainly most unfair on judge and exhibitor to place these two very distinct breeds together. “Comparisons are odious,” we are told, and certainly it is hard on the brownies for the more brilliant silvers to be placed side by side in competition. As regards the mating of silver tabbies, the essential point to try and breed for is markings, and it behoves the fancier to endeavour to find a sire with bold, distinct tabby markings, and if it is desired to strengthen the colour, then a black is not at all a bad cross. There are two distinct kinds of tabbies—the blotched and the pencilled varieties; and it is a matter of choice which is considered the handsomest. But it does not do to mate these two varieties together. A well-known authority on breeding silver tabbies writes thus in _Fur and Feather_:—“A great deal has been said as to the disadvantage of crossing chinchillas with silver tabbies, but we think this applies more to the detriment of chinchillas than of tabbies. Provided the tabby, on one side, is of a very decided type, the chinchilla, having come originally from the same stock, may not prove a bad cross. Miss Cope’s ‘Silver Tangle,’ for instance, one of the best-marked silver tabby queens, is the child of the chinchilla ‘Silver Chieftain,’ and of a queen bred from a silver tabby sire. A good young queen, belonging to Mr. Hoddinott, was bred from ‘Lord Argent’ and a tabby mother. ‘Champion Felix’ was bred from ‘Topso,’ a heavily marked tabby, and ‘Lady Pink,’ a cat that would nowadays have been called a light shaded silver with white markings. ‘Climax’ came of the same parents, and both have broad dark markings, and transmitted them to their offspring. The union of two strongly marked silvers is not always a complete success. A brown tabby makes a most excellent cross, and some of the purest and best silvers we have seen have been obtained in this way. Of course, you must be prepared for a brown tabby kitten or two; but you need not fear sandy smudges and yellow noses. The colour seems to be concentrated in one or two examples, and leaves the silver free. In short, in colour breeding we must be content with one or two perfect specimens in a litter, and, retaining them, try again for yet further perfection.”

The cat fancy needs some new sensational cat to appear on its horizon, and if only a perfect silver tabby, male or female, could be penned at one of our leading shows a great impetus would be given to this variety, and a thoroughly good strain might be established. Then we should not read such remarks as these from the pen of the reporter: “The silver tabbies, we regret to say, were only a shade of days that are gone. There is room for an enterprising enthusiast in this breed. The beautiful clear silver colour with deep black markings seems to be quite a thing of the past. Who will revive them?” And echo answers, “Who?”

From such an authority as Miss Anderson Leake the following article on silver tabbies will be of great interest, and the photos of her cattery at Dingley Hill, Bradfield, near Reading, have been specially taken to illustrate these notes:—

“Possibly amongst the rarest of our long-haired cats may be classed the really well-marked silver tabby. Twenty years ago he existed, and was, indeed, more commonly met with than to-day. For at that time chinchillas were practically unknown, save for a few scarce specimens, and the silver cats of that day were more commonly called ‘grey’ Persians, and were nearly always tabbies. But with the popularity of the pale chinchillas began the downfall of the heavily marked tabby. Instead of breeding for the preservation of markings, everyone worked their hardest to breed out markings, and real tabby kittens were almost unsaleable. Those that were produced were very frequently ventured, and sold at a low price for pets. The lightest specimens in a litter were preserved for breeding purposes, and rarer and rarer became the deeply marked silver tabby. But at last the tide has turned, and people are beginning to realise that there is a character, a beauty, and a contrast of colouring in a good tabby, which lend to them a charm all their own. Added to this, they are exceedingly rare and difficult to produce.

“Competent judges agree that to breed regular, symmetrical, and well-coloured markings is no easy task, for _contrast_ is the grand point in a silver tabby. His ground coat from tip to tail should be pure pale white silver. On this light silver ground-work lie the most beautiful even dark mottlings, dark to the point of blackness. These markings are most difficult to describe. A dark stripe runs the whole length of the spine. Then comes a light stripe on either side, then two more dark stripes, but these are broken just behind the shoulder by a transverse bar of light silver, and widen on the shoulder into considerable sized patches. The markings on the sides are not stripes, but patches, elliptical in shape, generally three in number, and partially encircled by dark stripes. The shoulder is particularly heavily barred and striped, as are also the hind quarters. The legs are barred throughout their length, the face should be dark, with dark tufts, and the back part of the hind legs from the knee downwards is black, as in a Southdown sheep.

“The head is most beautifully pencilled, the cheeks possess double or treble swirls, the eyes are outlined by dark rims; on the forehead the lines form a complete triangle, which is repeated at the nape of the neck. The chest is encircled with a perfect dark ring, called the ‘Lord Mayor’s chain,’ but this is concealed when the large light frill is in full beauty, as is also the neck triangle. The whiskers often contain all the different shades of colour found in the coat. The ear tufts should be long and light. The tail is generally ringed from trunk to tip, but this is not noticeable after kittenhood, owing to the great length of the hair. Also the hair to the root is much darker in colour on the tail than on the body.

IN THE STUDIO.

(_From a Painting by Madame Ronner._)]

[Illustration:

MISS COPE'S "STARLET."]

"The correct colour for the eyes of a silver tabby is neither green, orange, nor yellow, but hazel—a deep nut-brown. This shade of eye is very difficult to obtain, and it fades with age; but once seen, its beauty and suitability to the colouring of the cat will never be denied. Many of the most noted prize-winners have not possessed this coveted hazel eye. The nose is by preference dark, but this, so far, has not been considered as a point.

"Not only evenness and regularity of markings go to the making of a good tabby, but sharpness and depth of colour in the dark parts, and clearness of colour in the light parts. A great deal has been said of late regarding the depth of the black markings; but it is quite as necessary to insist on the purity of the silver tone. No suspicion of brown must be tolerated, neither any blue nor grey tone.

"There is no question that, as a tabby, a long-haired cat is handicapped by his length of coat. There are some people who would rob him of his crowning glory in order that his beautiful striping may the better appear. But surely it were better for them to confine themselves to short-haired cats if they cannot appreciate the marvel of long-haired tabby markings. For marvellous they truly are, when we consider that the dark marks are only formed by tips to the hair of some quarter of an inch in length. When the coat is quite short these tips are massed together, and the blackness is, so to speak, concentrated. When the hair is at its full length—of from two to four inches—it can be readily understood that the long floating locks mix and mingle with the paler coat, and some distinctness of marking is lost. The massive frill and the long light shoulder tufts give the cat a very pale frontage; and if he be placed in a show pen side by side with a cat whose coat is just coming, whose marks show up, in all probability he will take a second place. No stroking, blowing of the coat, or other device will show off a tabby cat. He must be made to get up and walk. Then the long coat falls apart, the spine lines reveal themselves, the side patches fall into place, and bars, stripes, swirls, and rings all are to be seen. Even then you will not see them all at once, but as he moves and turns one by one the points will show themselves. As a show cat, a tabby is not a success, for his period of perfect beauty is exceedingly short. When he proposes to moult he changes colour, and if you are unwise enough to exhibit him at this stage ominous whispers of 'Brown tabby blood' will pass from mouth to mouth. For a thorough good rusty brown shade, commend me to a moulting silver tabby. Then a little later he completely loses his side markings, and you must wait until the new coat makes its appearance before you can venture him in the show pen. In the first beauty of that new coat, when the hair is about an inch long, he is a dream of colour contrast, and somehow suggests such ineffable cleanliness!

"How to breed silver tabbies is a moot point. One thing is certain, that if we expect whole litters of well-marked kittens we shall be grievously disappointed. Personally, we have had the best results from pairing two marked cats slightly related and of good silver pedigrees. A smoke of silver origin is another good cross, but the sire should always be a tabby. The blacker the kittens are at birth the better. There is no sign of light under-coat, but generally narrow pencillings of silver are to be seen, and face and paws are fairly light. The kittens which at birth show contrast of dark and light rarely turn out good tabbies. The markings, as a rule, become too faint. At a month old the light markings should widen and develop, and at three months old the full beauty will be seen. Before the change to cat coat, many of the kittens become more shaded than marked, and up to the sixth or eighth month there is always a possibility of their proving disappointing. If, however, after this age the markings return, harden, and develop, they will endure for ever, except during periods of moulting. In extreme old age both the purity of colouring and distinctness of markings are lost. Exposure to the sun considerably injures the colour of the silver tabby cats, giving them a brown tinge. We believe exhibitors of magpies never allow their birds to enjoy the rays of the sun for a similar reason, but it is a question whether it is not wiser to study the beneficial effects of a sun-bath on the health of our cats rather than the slight detriment to their coats caused by its enjoyment. I have said nothing about size and shape. The silver tabby should be a large cat, with good bones, and very heavily coated. The old-fashioned cats were very long, low on the legs, and a trifle narrow in head. Nowadays we have remedied this defect, and the modern cats are decidedly more cobby than their progenitors. The ears should be set wide apart, and be small and not too sharply pointed. If only fanciers will now devote themselves to the production of such cats as I have tried to describe, we shall soon see the silver tabby classes at our shows filled with typical animals, instead of, as is too often the case, with spoilt silvers, too heavily

marked to be called chinchillas, too unevenly or lightly marked to be correct tabbies."

I have mentioned Miss Cope as a breeder of silver tabbies. Her remarks on her favourite breed are as follows:—

"There is no doubt that until quite recently interest in this fascinating breed had, to a great extent, died out, owing to the craze for chinchilla breeding. But I hope their day is coming again. There is a marked improvement already shown in the silver tabby classes at the best shows.

[Illustration:

A PAIR OF SILVER TABBIES.

(_Photo: E. Landor, Ealing._)]

"Mr. St. George Mivart, in his celebrated book, asks, 'What is a cat?' But even so simple a question as that appears from his statement to be more easily asked than answered. The same may be said of the question, 'What is a silver tabby?' I will endeavour to answer the question by giving my own idea of what may be considered to be a perfect type of a silver tabby. The chief point of a silver tabby should be clearness and distinctness of markings; the sharper they are the better. My ideal cat would have the two spine stripes clear and well defined from shoulder to base of tail, set off by the 'epaulet' behind each front leg. On each side of the body should appear what may be called the horseshoe; both sides should match exactly. The hind quarters well barred. The fore legs should also be barred, each in symmetrical correspondence with the other. The double cheek swirls, the markings on the forehead, which may be easily imagined to take the shape of a lyre, the shaded eyebrows and whiskers, and dark outlines to the eyes, all these give a character to the face not found except among tabbies. More or less conspicuous will be the dark lines across the chest, known as the 'Mayor's Chain.' Occasionally some more favoured animal is found to have two such lines. The beauty of all these markings is thrown up by the ground colour of the coat, which should be a clear bright silver. The whole effect, if one may so describe it, is like a piece of elaborately wrought black lace on lustrous silvery silk. The colour of the eyes is somewhat a vexed question. Some fanciers prefer green. Personally, I think nothing is more lovely than the hazel eye, enhanced by dark rims. Happily, latitude is allowed in this direction in the standard drawn up by the Silver Society, which decrees the colour shall be the green or orange. But with all these, my ideal silver tabby must have perfect shape of body, so far as it is possible to obtain it, as well as luxuriance of coat. The long, thin-bodied, snipy-headed, spindle-legged cat is an abomination. The ideal cat must be cobby, with short, thick legs, the head broad and massive, ears small, well tufted and set wide apart, the nose short and wide at the tip, the tail short and wide at the extreme end—I consider a pointed tail very undesirable. The coat of the ideal silver tabby should be long and thick, and the texture as silky as possible.

[Illustration:

MISS DERBY HYDE'S "THAMES VALLEY SILVER KING."

(_Photo: E. Landor, Ealing._)]

"Having described my ideal silver tabby, the next question is how to get it. When I succumbed to the fascination of the long-haired beauties some years ago, I resolved to breed only from the very best stock obtainable, and I have unflinchingly adhered to this rule. I would like to impress upon anyone starting this delightful hobby that it is absolutely a waste of time and money to attempt breeding from any but the best. The observance of this principle will save many disappointments, much heart-burning, and not a little money. Having made up one's mind which breed one admires most, it is far better to keep to that particular variety, and win success worth having, than to dabble in a variety of breeds with only a moderate amount of success. To a rigid observance of these principles I owe any honours in the show pen which have been awarded to me. It is of little use taking up the breeding of long-haired silver tabbies unless one is possessed of unlimited patience and perseverance. It is sometimes very disappointing to find the kitten one fondly hoped would prove a coming champion merging into a shaded silver—exquisite in colour and as far as head, shape, and coat are concerned, but none the less not a silver tabby. Here comes in the study of pedigree. It by no means follows that the mating of two tabby parents will result in a litter of pure tabby kittens, unless both sire and dam are of pure silver tabby lineage. Hence purity of pedigree on both sides is of great importance.

"If there is a trace of chinchilla blood in the ancestry it is certain to manifest itself at odd times in the progeny. Nevertheless, do not despise your shaded silver, if it be a queen, providing all other points are perfect. As Miss Leake says—and I quite agree with her—'You no longer have a show specimen, but you have a cat that, crossed with a heavily marked cat, will probably provide you

with splendid silver tabbies.' This, however, can scarcely be called the true science of breeding, as the progeny of two such cats may hark back to some of the original characteristics.

"My own practice is to mate silver tabby with silver tabby invariably, and of the purest pedigree I can find. I should never breed from a sire that I knew possessed a brown tabby ancestry. I would far rather choose a good black sire, and in this way strengthen the markings. Of course, one would not expect a mating of this kind to produce a litter of champion silver tabbies; but if I secured one well-marked kitten I should feel quite repaid. On the general question of breeding, Mr. C. A. House, who is no mean authority, and whose suggestions I have often followed with advantage, recently said: 'If I were asked to pick out in a certain cattery a pair of silver tabby Persians which would be likely to make a good match, I should proceed on lines similar to the following:—Shape and size with quality of coat I should expect the dam to possess. Marking, colour, length of coat, colour of eye, and strength of bone, I should demand in my sire. This is, of course, if I were selecting from cats whose ancestry was quite unknown to me. My reasons for so doing are because in nine times out of ten the sire influences the outward characteristics of the progeny, while in like ratio the dam exercises her influence over those points which are more hidden. The dam has far more to do with shape than is generally supposed, and I would rather breed from a bad-headed male than a bad-headed queen. Quality of coat must always be looked for in the queen.'

"With regard to in-breeding I have no hard-and-fast rules to lay down. The whole matter, in spite of what one and another may say, is too experimental and speculative for anyone to dogmatise. The authority I have just quoted remarks on this matter: 'It sometimes happens that a fancier puts together two animals which excel in some particular property, yet not one of their progeny is above the standard of mediocrity, so far as that property is concerned.' Experience has shown me the importance of studying the weak points of the dam. These I try to remedy in selecting the stud cat. But with all my care I sometimes find 'the best laid schemes ... gang aft agley.'

"For the successful keeping of cats and rearing of healthy kittens, my prescription begins and ends with two words—liberty and fresh air. I have found cats can stand any amount of cold, providing, of course, they have never had artificial heat previously. Two things must be carefully guarded against—damp and draught. These are fatal. Kittens so reared will be healthier, grow better coats, and will be much better able to stand the wear and tear of show life. My own cats live in wooden houses, raised at least one foot from the ground, the size at least seven and a half feet by five and a half feet. Each house is fitted with an inner wire door, as well as the outer wooden one. Along the entire length of the upper part of one side is a wire netting window, with a broad shelf fitted beneath. This opening has also a sliding shutter fitted with glass panels. I am thus able to give ventilation at will, or fasten them up securely in bad weather. In one corner of the house is a cosy sleeping box: in another corner an equally cosy chair. All cats love a chair. Cats kept outside, when they are admitted to the house, invariably find out the most comfortable corner of the most comfortable chair. In such a house as I have described, kittens can be successfully reared; there is ample room for them to scamper round should a wet day keep them in. Unless it is absolutely raining all my cats have the run of a large garden the whole day, and are only shut up at night. I never coddle my kittens, but try to bring them up as naturally as possible.

"I am sometimes asked how it is my kittens attain such good proportions. The secret, if secret there be, lies in this—I never allow my mother cats to nurse more than two kittens after the first week. If a foster cannot be found, I select the two I consider the most promising, and the lethal chamber claims the rest. Some may consider this foolish. I can only say I would far rather rear two thoroughly healthy kittens than five or six little puny things that will require weeks of care and attention, and then fail to reach the end in view. Baby silver tabbies, I must admit, are not altogether things of beauty and of joy. More often than not they are dark and uninteresting. The time to decide which is the best-marked kitten is while the coat is comparatively short. When compelled to make a selection, I usually give the preference to the darker kittens. Experience has taught me that the lighter kittens, so attractive in themselves, even at that early stage, and whose colouring is so exquisite at eight or nine weeks old, are apt to prove deceptive in the end, and often develop into shaded silvers."

To Miss Cope's last statements I can add my testimony, but I will also mention a curious case coming under my direct notice and regarding my own silver stud cat. "Cambyses" is by "Mowgli" (a noted pale silver of "Silver Lambkin" strain) and a handsome silver tabby unknown to fame, being a house pet. When I became possessed of "Cambyses," then five months old, he was a decided silver tabby, taking after his mother; he has since shed all his markings, except faint grey pencillings on head and legs, and is one of the lightest silvers at stud. When mated to smokes and silvers I have not known or heard of any tabbies in the litters; but on one occasion, when crossed with a silver tabby, he had some very densely marked tabbies. I have remarked that this beautiful breed of Persians has not been taken up by American fanciers in the same enthusiastic manner as have blues, orange, and especially silvers. In an account given by _Field and Fancy_ of the Beresford Cat Club show in New York, January, 1903, I find mention made

that over 125 long-haired cats were entered, and that in the silver classes alone there were thirty-five entries, almost as many as were entered in the whole long-haired section of the previous year. The smoke male class was cancelled, but eight females of this breed put in an appearance. No mention is made of silver tabbies. Amongst the winners of the challenge cups offered by the Atlantic Cat Club, a silver tabby called “Queenie,” owned by Mrs. Wagner, carried off the trophy. Miss A. Leake, of silver tabby fame in the English fancy, has exported some of her stock, and no doubt our American cousins will not let this beautiful breed remain long neglected, but some enthusiastic fancier will establish a strain on the other side of the herring pond.

At the Westminster Cat Club show of 1903, held about the same time as the Beresford New York show, the entries in the three classes provided for silver tabbies numbered twenty-seven, which is an increase on previous years, but with two or three exceptions quality was lacking. No new names appeared in the catalogues, and Miss Anderson Lecke and Miss Cope carried off the highest honours.

The winner in the female class was “Roiall Fluffball,” whose portrait appears below, and who is the best-marked silver tabby that is now before the public. Miss Cope must be proud of having bred so fine a specimen by Miss Anderson Lecke’s “Abdul Hamel of Dingley,” whose picture appropriately forms the heading of this chapter on silver tabbies.

CHAPTER XIV. SMOKE PERSIANS.

[Illustration:

“JO” and “TINY” (SMOKES).

(_Photo: Gross, Brooklyn, N.Y._)]

It is only within recent years that smoke Persian cats have really come into notice at all, and even now these lovely cats may be said to be sadly neglected in the fancy. It was not till the year 1893 that they were considered sufficiently popular to deserve a class to themselves. They were formerly relegated to the “any other colour” class, and very often at smaller shows this is where we find the smokes penned. A really good smoke is a thing of beauty, and it seems certain that as the fancy expands and the Silver and Smoke Cat Society looks after their interests, a good time will be in store for breeders of this handsome variety.

Smokes may therefore be called a new breed, and it is a very distinctive one, made up, as it were, of the three self colours—black, white, and blue. It is a shaded cat without markings, the fur being pure white underneath and gradually assuming almost a black tone on the outer coat. The face, paws, and back down to the tip of the tail are the darkest parts, shading to a dark grey down the sides and on the under part of the tail. A very great beauty in smokes is the light frill and ear tufts, which lend an air of much distinction to this breed. The great failings in many smokes is the appearance of tabby markings; these especially mar the beauty of head and face, and take away from their value in the show pen. The tail should be quite free from any rims of light and dark, and should have the upper part an even dark colour, and underneath a cinder grey. Some smokes are so dense in the surface coat as to be really black cats with white under-coats, having none of the modulated grades of dark and light grey. These cats are often minus the light ear tufts and ruff, and therefore cannot be regarded as correct smokes. Then, again, there are light smokes which might almost be called silver smokes—very beautiful cats to look at, but far removed from the ideal smoke.

Perhaps at some future time there may be a special classification for these cats, which are now without an abiding place at our shows. It is most important that the coat of a smoke should be long and of the true Persian flakiness, otherwise the chief beauty of

the contrast between the light under-coat and dark outer coat is not seen to full advantage.

I think I may say without fear of contradiction that, of all long-haired breeds, smokes present the most altered and absolutely dishevelled appearance when out of coat. The glory of the light frill disappears, and multitudes of lines and streaks can be plainly discerned. Then a very rusty brown tinge appears on the back, and the rich, glossy black surface coat vanishes. I owned a lovely smoke cat once that at certain times of the year—and, I may say, for most part of the year—was nothing better than a bad black, his only claim to the title of smoke being the general appearance of a dark cat that had spent his life in an ashpit. But when "Pepper" was in full feather, he was a joy to behold.

It is curious that when the kittens are first born they appear almost a dead black, with no trace of a white under-coat. This appears gradually as the kittens grow, and at three weeks old the lighter coat becomes visible. Their faces and paws should be intensely black when born, as the tendency in smokes is to get lighter and not darker. If a kitten is born with the appearance of a smoke it will generally turn into what I have termed a silver smoke later on. As with black kittens, so with smokes: they are often very rusty in appearance, but this will disappear with their kitten coat. This also applies to tabby markings, though, of course, if there is any tabby blood in the strain the markings may be retained. For this reason it is most undesirable to mate smokes with tabbies; neither is it advisable to select a blue as a cross. The blue tinge destroys the purity of the white under-coat, which is one of the glories of a perfect smoke. It is a case of "like to like" in breeding smokes, and, failing this, choose a good black sire for your queen with amber eyes. This is especially advantageous if your queen should be light in colour, and throw light kittens; but if she is already too dark, mate with a chinchilla, avoiding, if possible, a green-eyed one.

Above all things shun, as you would Sin, tabbies of any colour, and let your choice fall on a heavily coated sire. I have been told by smoke fanciers that it is much more difficult to breed a good smoke female than a male, and that the latter sex predominates in litters.

I will here give the officially approved table showing the proportion of marks which should be awarded for points of smokes. This is as drawn up by the Silver and Smoke Persian Cat Society, which has Mrs. H. V. James, our principal breeder of smokes, as Honorary Secretary:—

[Illustration:

MISS BARTLETT'S TWO SMOKE KITTENS.

(_Photo: E. Landor, Ealing._)]

SMOKES.

Smoke cats should be black, shading to smoke (grey), with as light an under-coat as possible; light frill and ear tufts; eyes to be orange.

Value of points:—

Head and expression 20 Colour of eye 15 Colour of under-coat 10 Absence of markings 15 Coat and condition 20 Tail 10 Shape 10 ——— Total 100

I think there are no fanciers or breeders of smokes who feel that any option should be given as to the colour of eyes in this breed, for, as in the black cats, the eyes should be amber or light golden. However, I must confess that brilliant green eyes are to be preferred to the pale yellow, which too often spoil the beauty of many of the smokes now exhibited. I should never place an indifferent smoke with orange eyes over a good specimen with eyes of emerald green. In the early days of the fancy, smokes were entered in the "any other variety" class, and were sometimes called Smoke Blues or Smoke Chinchillas.

In 1891 Miss Manley (now Mrs. Strick) exhibited a fine smoke called "Bayadere." Amongst the names of our oldest smoke breeders who still continue to breed I may mention Mrs. Cartwright, of Upwood. In 1895 this lady showed smokes at Cruft's show bred from her "Timkins." The Upwood cats are very pure in colour, having the dense outer coat very white at the roots. At one time the Lindfield smokes held their own everywhere, Miss Molony winning first at the Crystal Palace in 1893 with "Lindfield Bogie." Mrs. Bluhm, better known as a silver breeder, also owned about this time a famous smoke female called "Smuttie."

Mrs. Robert Little has for years combined the breeding of smokes with blacks. In 1897 “Namouska,” a smoke female, won first at the Crystal Palace, and her descendants continue their career as first-class smokes. In more recent times the following are noted winners: Lady Marcus Beresford’s “Cossey,” Mrs. H. V. James’s “Backwell Jogram,” Mrs. Sinkins’ “Teufel,” Mrs. Stead’s “Ranji,” Mrs. Stillwell’s “Victoria,” Miss Snell’s “Dusky Girl,” Mrs. Collingwood’s “Minouche,” Rev. P. L. Cosway’s “Maritana,” Mrs. Neild’s “Silver Soot,” Mrs. Hamilton’s “Bulger,” Miss Rose’s “Judge.” Perhaps the most consistent and successful breeder of smokes now in the fancy is Mrs. H. V. James, who started in 1893, and has been faithful to this breed ever since. I have had the pleasure of visiting Mrs. James’s smoke cattery, and I felt that the lovely old-fashioned garden surrounding the Grange at Backwell was truly an ideal place for successfully rearing live stock of any kind, and all the pussies were pictures of robust health. I am glad to be able to insert the following valuable article on smoke Persians from the pen of Mrs. James, who is certainly our best authority on this breed.

“Before entering upon the distinctive points of smokes, I will give a short account of my smoke cattery, and how I first took up this breed. It is curious to look back and see what mere chances govern our actions. I have all my life been devoted to Persian cats of one colour or another, but never intended to go in for any special breed. However, in 1893 I purchased a blue kitten, which, on its arrival, appeared far from well. The man who sold it offered, if it died, to replace it. In a few days I was in a position to accept this offer, for the kitten succumbed, and another—which was also supposed to be a blue—was sent to replace it. As time went on this kitten darkened, and, much to my disgust, turned to a deep cinder colour. In 1894 there was a grand West of England Cat Show held at Bristol, and, to please an old servant who had taken great care of the kitten, I entered ‘Jubilee.’ I was not much up in cat showing then, but ‘smoke’ seemed to answer the description of the kitten better than any other colour; so into the smoke class he went, and, to my surprise, carried everything before him. This started my career as an exhibitor. I showed ‘Jubilee’ again at Cruft’s and Brighton the next year, where he again carried off firsts, and was described as the best smoke cat seen since the days of the famous ‘Mildew.’

[Illustration:

MRS. JAMES’S CAT HOUSES AT BACKWELL.

(_Photo: F. Holmes, Clifton, Bristol._)]

“At the Palace in 1894, I bought a smoke female kitten from Miss Bray as a mate for ‘Jubilee.’ This mating proved successful, and I had several grand litters of smokes, most of which, I am sorry to say, went to swell the ranks of neuter pets, being given as presents to my friends. In time I learnt wisdom, however, and kept my smokes myself. ‘Jubilee’s’ career as a show cat was unfortunately cut short after his Brighton win in 1894. He escaped one night, and in a fight with another cat had his ears so torn that I was unable to exhibit him again. A year later, when I was away from home, he was let out one day, and never returned, having, I expect, been trapped in the woods. At that period my smokes nearly died out, as I had only one litter a few weeks old by ‘Jubilee.’ Of the two smokes one was promised, and the other I kept, and he is still alive as ‘Champion Backwell Jogram.’ So I think I may consider I have had my share of luck, though, like most breeders, I have had my bad times, and have lost sometimes as many as twelve cats and kittens in a few days from distemper, and once or twice a very promising female has strayed into the woods and been seen no more. I hope, however, that for some years, at least, ‘Jubilee’s’ descendants will continue to flourish, as there are a number of ‘Jogram’s’ kittens scattered over England, and several have left these shores for America.

“In mating my smoke queens I have several times tried a black sire, and have always been successful in getting good smokes from this cross. ‘Jubilee II.’ is an example, being by ‘Johnnie Fawe,’ Dr. Roper’s famous black Persian. I have only once—years ago—tried a blue cross, but the result was a mixed litter of blacks and blues. I have found that all the blue queens mated with ‘Jogram’ have had chiefly blacks. Smokes may be considered a very hardy breed, perhaps from the fact that there has been little in-breeding so far. ‘Jogram’ lives in an unheated wooden house all the year round, and has never even had a cold. Kittens will also stand the same treatment.

[Illustration:

MRS. A. M. STEAD’S SMOKE PERSIAN “CH. RANJI.”

(_Photo: E. N. Collins, S. Norwood._)]

“And now I will endeavour to give my ideas as to the points which go to make up a perfect smoke. A good smoke is perhaps one of the most beautiful of the many beautiful breeds of long-haired cats, a bad smoke one of the plainest. The novice—for whom this

article is principally written—may therefore be glad to have a clear definition of a smoke to start with.

“The definition drawn up by the Silver Society when it first started reads as follows: ‘A smoke cat must be black, shading to smoke (grey), with as light an under-coat as possible, and black points, light frill and ear tufts; eyes to be orange.’ But the word ‘black,’ having sometimes led novices to suppose that a black cat possessed of a white under-coat is a smoke, it would be perhaps safer to say ‘a smoke is a deep cinder-coloured cat shading to grey, with a white under-coat,’ etc. In order to distinguish the difference between black and the true cinder colour of the smoke, it is an excellent plan to keep a sound black cat in a smoke cattery.

“Smokes are, comparatively speaking, one of the newer breeds of long-haired cats, and arose from the crossing of blues, blacks, and silvers, and appeared as a freak in litters of blues or silvers, and, being beautiful, were kept by their owners. No serious attempt, however, was made to breed them until quite recently. If beauty and a hardy constitution count for much, they should be more popular even than they are at present; but no doubt the extreme difficulties of breeding a good, unmarked shaded cat deter many breeders from taking them up. With a whole-coloured cat it is fairly plain sailing when a strain, sound in shape and bone, has been established; but with a shaded cat it is quite another matter. Litter after litter of kittens appear, grand in shape, strong in limbs, apparently perfect in shading. In a few months the kittens moult, and the shading becomes perhaps a hopeless jumble of light and dark. Where it should be dark it has turned light, and _vice versâ_. Still worse, the shading disappears, and the markings—the bugbear of all smoke breeders—appear, showing traces of the far-away silver tabby ancestors. These markings have perhaps been lying dormant for a generation, and appear as a reminder of the silver tabby origin of the smoke.

“To all smoke breeders who wish to succeed I would say, ‘Never part with a well-shaped smoke until at least a year old, lest you find you have, in rejecting the apparently ugly duckling and keeping the gem, thrown away the substance for the shadow.’ On the subject of mating, there is much to be said. I am afraid many owners of smoke queens mate with any coloured cat which takes their fancy in the hopes of getting something in the litter besides smokes.

“I have sometimes heard owners say, ‘Oh! I mate my smoke queen with all sorts of colours. She always has one or two good smokes in each litter.’ That may be true, but if a smoke strain is to be built up, you are making a fatal mistake. The kitten thus bred goes to a new home and is expected to produce smokes as good as herself. She is mated with a smoke male, and when the litter arrives there are perhaps no smokes, she having thrown back to her sire, so as a breeder she is useless. Smoke to smoke must be the rule, except in special cases—when, for instance, the queen is on the light side; then a cross with a black may be found to be necessary. Or the queen may be too dark and given to breeding black kittens. Then the choice should fall on a silver as free as possible from silver tabby relations. On no account must a tabby of any colour be chosen or a sire with any white. A blue should also be avoided, as the under-coat is liable to take the blue shade and become blurred instead of _white_ at the roots.

[Illustration:

“CHAMPION BACKWELL JOGRAM.”]

“Orange eyes are much prized in smokes, and I believe, from my own experience in breeding smokes for the last ten years, that it is from the mothers that the kittens get their eye colour. If the queen has pale green eyes you may mate her with all the orange-eyed sires in the kingdom, and the eyes will still be pale. But if the queen has deep orange eyes, the kittens will inherit them also, even should the sire have only pale eyes.

“Thanks to careful mating by some of our smoke breeders, smokes are not the flukes they once were, and a smoke queen, well mated, may now be relied upon to produce whole litters of smoke kittens. As a rule, the kittens at birth are quite black, and remain so for a week or so; and my experience has been that if a kitten shows any trace of grey at birth, it will grow up too light. There are, however, a few well-known queens who throw almost silver kittens, which remain so for weeks, and then shed this kitten coat for a darker one; so no hard-and-fast rule can be laid down as to what a smoke kitten should look like when born. Try in-breeding for coat to avoid the sleek or woolly-coated smoke, and aim at getting a cat with a coat of the true Persian flakiness described by Mr. Harrison Weir in his book on Persian cats, otherwise the chief beauty—the light under- and dark outer coat—is not seen to advantage as the cat moves. One point to be remembered in this breed is that the new coat growing is dark just at the roots. These marks, when the smoke is changing coat, have often been mistaken for tabby markings, so for this reason it is most unwise ever to show a smoke when out of coat. Wait until your cat is in full coat before accusing it of having tabby markings.

“There is a fashion in smokes, as in everything else; and at present in England the very dark smokes are the rage, but in America the light ones are more sought after. That grand cat ‘Watership Cæsar,’ who was considered too light for English taste, was last

year bought by the late Mrs. Thurston and taken to America, where he carried off all the smoke honours, also taking the prize for the best cat in the show. The same happened to Lady Marcus Beresford's 'Cossey,' a lovely cat of the lighter type. The tide may turn, however, even in England, where the slightly lighter smokes may share the honours with their darker brothers. It is better, however, to be on the safe side and breed for the darker smoke, as the lighter are apt to lose the smoke characteristics and overstep the line which divides them from a shaded silver."

Mrs. Sinkins, to whom I have alluded as a smoke breeder, owns a splendid stud cat called "Teufel" that has made a name for himself as a first prize-winner. This cat is as nearly a perfect specimen as it is possible to find. Mrs. Sinkins has written a few notes on smokes.

"I must consider myself honoured in being asked to write about smoke Persians in 'The Book of the Cat,' as I am, comparatively speaking, a beginner in the cat fancy, only having kept Persians for three years or so. I began by buying a well-bred queen in kitten, and she presented me with two chinchillas and a perfect smoke female, which I named 'Teufella,' and showed at Westminster in 1899. She carried all before her, winning everything in her class, and was claimed at once at catalogue price. From a silver half-sister of hers I then bred 'Teufel,' whose picture is in this issue, and who is a great pet, being extremely sweet-tempered and affectionate. His chief characteristics are his _absolutely unmarked_ black face and the lovely white under-coat, so desirable in a perfect smoke, and for which he received a special this spring (1902) at Westminster. I hope some of his descendants will take after him in these respects and make smokes increasingly popular.

"In my opinion, it is a fatal mistake to mate smokes with blues, as they then lose this white under-coat. I think one obtains it best by mating a _smoke-bred_ smoke cat with either a _silver-bred_ smoke or else with a silver cat, as unmarked as possible, who possesses a smoke ancestor. Some day I should like to try mating a black with a pale silver, just as an experiment.

"As to eye colour, there can be no two opinions. The deeper the orange, the better.

"I do not find smokes at all delicate, no more so than the common or garden cat. All my queens have entire freedom, one in particular being a first-rate ratter and mouser, even catching moles sometimes. And they live out of doors in unheated houses all the year round, even in the most severe winter.

"It seems hard that all Persians should have to pass through an 'ugly' period—luckily a short one—when they change their coats, looking ragged and certainly not their best. Smokes and blacks then show the brown tinge even worse than chinchillas, as it gives them the poverty-stricken appearance of rusty moulting—though I must say 'Teufel' has so far been the exception, taking all honours at one show when in full moult.

"However, their good time fully compensates for the shabby period, and a typical smoke, with his large orange eyes set in his black face, with light ear tufts and frill, his white under-coat showing with every movement, is a thing of beauty hard to beat, and I feel sure the smoke variety has a great future before it."

[Illustration:

MRS. SINKINS' SMOKE PERSIAN "TEUFEL."]

Mrs. Stead, the owner of "Champion Ranji" and "Rhoda," a winning smoke female, has kindly given me her opinion on smokes:—

"My ideal of perfect smoke cats is that they should be black, shading to smoke grey, with as light an under-coat as possible, light frill and ear tufts, eyes orange. This is the standard up to which I try to breed. I find the kittens go through several stages before they approach this perfection. For instance, a kitten I had in the spring of 1902 lightened considerably, and developed markings on the face, but at eight months old he was nearly up to the standard. A litter of six I have recently bred were entirely unmarked at birth, being, in fact, quite black. Five are now medium-coloured smokes, and one a very dark one, with beautiful light under-coat. I strongly advise all breeders not to despair of colouring until their kittens are fully grown. Permanent markings are, of course, very detrimental, and there is always great anxiety as to the final colour of the eyes. If, however, both parents are good in this respect, the result is generally satisfactory."

The following article on smoke cats in America is taken from _Field and Fancy_ of October, 1902:—

"Smokes, with us, will probably rank with the silvers, and are destined to always hold a measure of popularity, though we have not such a very strong lot; in fact, we may say that good smokes are never so numerous anywhere as to become a nuisance, and we

may fairly congratulate ourselves at this stage of the game upon what we have had and bred.

“Opinions differ as to what is a smoke, and at times we have to be rather lenient in the judging of these cats, for they are apt to be off colour—too light or too streaky. No one has yet, in America, taken up the colour solely to breed smokes and nothing else, which seems a pity, for they can be bred and kept with blacks, and each sets off the other, and when visitors come to the cattery the contrast is made more apparent.

“Those not conversant with the colour are apt to think anything smoky is a smoke exhibition cat, and no doubt, when good, those cats with dark faces and paws and light bodies are very handsome, but more often than not they are streaky and are smoke tabbies. After mature consideration and after seeing a good many, we, as well as other breeders, still think that unless the ‘Southdown’ cats, as some have called them, are very good we had better stick to the old definition of a smoke, and demand them dark enough.

“A really dark, rich smoke without marks is, without doubt, one of the richest in colouring of all our long-hairs, and the stars are few. One may go away from the original definition of a smoke, but when brought face to face with a good one it forces one to confess that this is the genuine article, and, when in grand condition, a thing of beauty and a joy for ever.”

CHAPTER XV. ORANGE PERSIANS.

In the short-haired varieties, these cats are sometimes called red tabbies; but I do not think the term gives such a true idea of the correct tone of colour, which should be just that of a ripe orange when in perfection. As I write I have in my mind’s eye the mass of bright colour presented by a pile of oranges in a greengrocer’s shop, and this is the tone that is to be desired in our orange cats. There is a dash of red in the ideal orange cat, suggestive, perhaps, of the blood-oranges with which at Christmastide we are familiar. Anyhow, an orange cat should be as far removed as possible both from sandy or yellow or, as I have heard them called, lemon-coloured cats.

I have left out the term “tabby” from the heading of this chapter, and I think advisedly; for in the Persian varieties the markings are gradually but surely vanishing, and orange cats may be said to stand in the same relation to orange tabbies as shaded silvers do to silver tabbies. I mean that most of the orange Persians now exhibited have shaded bodies, with tabby marking on head, face, and paws. The body markings, never very strong in Persian tabbies, are even less distinct in the orange than in the silver varieties. It may therefore be said that in judging this breed as they are represented in the show pen to-day, colour is taken into consideration first, and tabby markings are of less account. As regards other distinctive features of this breed, I may say that it is the exception, and not the rule, to find good round heads and short noses. The longest faces I have ever seen in any felines have been those possessed by orange Persian and short-haired cats. I have really sometimes felt quite sorry for a magnificent puss of this colour whose nose was so self-assertive that every other point, however excellent, seemed to be lost sight of, and that nose with the accentuated terminus stood out with distressing prominence. Until the year 1894 the classification at the Crystal Palace was “brown or red tabby, with or without white,” and the descriptions given in the catalogue by some owners on entering their cats read “brown and red,” “red-marked tabby,” “spotted red tabby,” “sandy Persian.” In 1895 orange and cream cats were placed together in one class.

(_Photo: E. D. Percival, Ilfracombe._)]

A specialist society for orange, cream, fawn, and tortoiseshell cats was founded in 1900, and although the number of members is small, yet they have proved a strong body of staunch supporters of these breeds, and a really astonishing amount of good work has been done by these few enthusiasts. The classification at the large shows has been greatly supplemented, and, whereas before the formation of the society the sexes were never separated, now this energetic little club asks for, obtains, and often guarantees extra classes. The result, therefore, to breeders of orange and cream cats is much more satisfactory, and males and females have their respective classes; and right well have they been filled. It was in 1900 that classes for creams were introduced at shows. At the Richmond show in 1902 there were thirteen entries in male and thirteen in female orange and cream classes, the sexes, but not the colours, being divided. This was really a splendid testimony to the efforts of a specialist society of less than two years’ standing. It is such a short time ago that orange, cream, and tortoiseshell cats were relegated to the “any other colour” class, even at our largest shows; now it is often remarked by reporters in the cat papers that the well-filled cream and orange classes were the chief attractions of the show.

[Illustration:

“SWAGGER.”

BRED BY MRS. VIDAL.]

I will here give a copy of the circular issued by the honorary secretary inviting members to join, and the points for orange cats, as drawn up by the specialist society, which were decided upon at the inaugural meeting:—

ORANGE, CREAM, FAWN, AND TORTOISESHELL SOCIETY.

LONG AND SHORT HAIRED.

As societies have been lately formed to promote the interests of one or more colours in the cat world, it has been thought by a few fanciers of orange, cream, fawn, and tortoiseshell cats that there is an opening for a society for the purpose of encouraging the breeding of these colours. The objects of such a society would be:—

(1) To secure better classification for these varieties at the different shows.

(2) To encourage fanciers to breed and show these colours by offering special prizes, etc.

(3) To improve the type of cat bred.

(4) To secure recognition for all shades of orange, cream, and fawn; and, inasmuch as many fanciers disagree as to the merits of the different tints for eyes, to encourage the breeding and showing of specimens with green, orange, hazel, and blue eyes.

Miss Mildred Beal, Romaldkirk Rectory, Darlington, has undertaken to act as hon. sec. to the society, and will be glad to hear from any fanciers who may wish to support it.

November, 1900.

ORANGE SELF OR TABBY POINTS.

Colour and marking.—Colour to be as bright as possible, and either self or markings to be as distinct as can be got. 25.

Coat.—To be silky, very long, and fluffy. 25.

Size and Shape.—To be large, not coarse, but massive, with plenty of bone and substance; short legs. 20.

Head.—To be round and broad, with short nose, ears small and well opened. 15.

Eyes.—To be large and full, and bright orange or hazel. 5.

Condition.—10.

It will be noticed that the heading of these points is “orange self or tabby”; but, as I have pointed out, the cats exhibited as orange Persians are neither self-coloured nor can they be called tabby. So it remains to be seen which type of cat will in due course be the established one. I incline towards a self-coloured orange in the Persian breeds, and a very handsome cat this would be—of just one tone of bright even colour, perhaps slightly lighter on the flanks and stomach, under the tail, and with a frill of paler tone. In fact, very much the type of a smoke cat, in two shades of brilliant orange. At the same time, if real orange tabbies can be bred with the distinct body markings these should be encouraged.

At the Cat Club shows it has been customary to give the classification for orange cats _marked_ or _unmarked_, so that then the judge may not have to take tabby markings into consideration, but give his awards according to colour and other points of excellence. It is the same when a class is given for sable or brown tabby, silver or shaded silver. In such classes it would be unfair to consider either the tabby markings in the one or the amount of shadings in the other. Of course, it is possible that in time orange cats may be bred to such perfection that two distinct classes will be given, namely “orange” (selfs) and “orange tabby.” In former years blues (selfs) and blue tabbies were included in one class, but gradually blue tabbies have been disappearing from our midst. If, therefore, orange tabbies—I mean, of course, long-haired cats—should likewise become extinct, our browns and silvers would be the sole representatives of tabbies in the long-haired varieties.

“BENJAMIN OF THE DURHAMS.”

THE PROPERTY OF MRS. D’ARCY HILDYARD.

(_Photo: Burgess, Market Lavington._)]

As regards the eyes in orange Persians, the standard given in the foregoing list of the specialist society is “bright orange or hazel.” I should prefer the terms “golden bronze or hazel,” as there is a special shade of gold with a dash of bronze or brown which seems to tone best with the bright coats of these cats. Certainly the pale yellow or greenish-yellow eye is not desirable—better a bright green eye. I often wonder if ever fanciers will be fortunate enough to breed an orange Persian with bright blue eyes, such as are seen in whites and Siamese. I have heard of a short-haired orange cat with blue eyes, and sometimes I have been told by a fancier of the Persian tribe that they had bred an orange, and its eyes had not turned from the deep kitten blue at four months, so they were fondly hoping they were going to astonish the cat world; but their hopes were dashed to the ground, for surely and sadly a change came o’er the colour of that cat’s eyes, and it was a case of the blue that failed! I once noticed an advertisement in one of our cat papers which announced, “For sale, a unique orange Persian male with perfect deep blue eyes”; but I also remarked that the age of this unique specimen was not given, and I did not think it was worth while to write and inquire.

The texture of coat in this breed ought to be particularly soft and silky, and is often of great length and thickness. The kittens when born are usually dull in colour, and gradually brighten as they grow older. As is well known to cat fanciers, orange females are rarer than orange males, so their market value is higher. There is, therefore, always a flutter of excitement on the arrival of a litter, and too often fate has decreed that all are males!

Orange cats make a splendid foil for other varieties. This is especially the case as regards blues and blacks; the contrast in colour enhances the beauty of each. I know one lady who, having an eye to the artistic, keeps a blue and an orange neuter, and a lovely pair they make. I think the largest cat I ever saw was an orange neuter that simply filled the show pen with a mass of bright colour—but he had a white shirt front and white gloves!

As regards mating orange cats, they make a good cross with blacks and tortoiseshells; and if a brown tabby lacks the admired tawny or golden tint, then an orange may assist to brighten and improve the general tone, and do away, perchance, with that drabbiness which is so undesirable in a brown tabby.

[Illustration:

“TORRINGTON SUNNYSIDES.”

THE PROPERTY OF MRS. G. W. VIDAL.

(_Photo: G. W. Vidal._)]

I do not think orange cats have ever been very popular, and I have remarked at shows that a certain number of people refuse to give anything but a passing contemptuous glance at the classes which contain what they call “those yellow cats.”

A very common defect among orange Persian cats is the white or very light chin. Sometimes there is the still more damaging blemish of a white spot on the throat, spreading, perhaps, further down the chest. It is very rare to find an orange that has really a dark under-lip, and chin level in tone with the body colour. The white lip is a bugbear to breeders and exhibitors, for Nature repeats itself, and judges make notes of the defect; and in these up-to-date catty days of specialist clubs and standards of points a cat full of quality failing in one particular is too often a white elephant, if desired for anything more than a pet. I have observed that orange cats will sometimes develop a light or nearly white chin in their old age. I never consider a white spot or tuft of white hairs such a blemish to a cat if these are on the stomach, as compared with the same defect on the throat. Such a spot would not be so likely to be handed down to successive generations; and, of course, a blemish that has to be sought for in an obscure part of the body is not such an eyesore in a self or tabby cat. I have often observed orange cats with very light hair underneath which has almost approached white; but such defects are sometimes only temporary, whereas a white spot on the throat or a white chin remains once and for ever.

In the early days of the fancy, orange cats were decidedly more tabby marked than they are in the present day. A noted one of this type was “Cyrus the Elamite,” born in 1889, and bred by Mrs. Kinchant, an enthusiastic fancier at that and later periods. In 1893 and 1894 Mr. Heap exhibited a handsome orange, “Prince Charlie,” at the Crystal Palace. He also owned another, called “Prince Lyne,” of the same breed, the celebrated tortoiseshell “Queen Elizabeth” being the mother of both these cats. “Puff” was exhibited by Mrs. Spackman in 1894; this orange cat was not much marked, and “Lifeguard” was bred from him. It was about this date that unmarked orange Persians became more fashionable. Among females, “Lifeguard’s” sister, “Goldylocks,” owned by Mrs. Marriott, was one of the very best queens ever shown. Mrs. Foote, who is still well known in the fancy, had several beautiful orange females, notably “Marigold,” “Buttercup,” and “Cowslip.” With these cats Mrs. Foote tried to breed unmarked creams and oranges, “Ripon,” a noted cream, being the sire. She built up several storeys of her catty castle, but then sold them to Lady Marcus Beresford. “Trilby,” litter sister to “Zoroaster,” a famous cream, was one of the brightest and deepest coloured orange females—or, indeed, orange cats—that has ever been seen.

[Illustration:

“LIFEGUARD.”

FORMERLY THE PROPERTY OF LADY MARCUS BERESFORD.

(_Photo: E. Landor, Ealing._)]

Coming down to the present day, I may remark that the number of orange cats placed at stud is very limited. A great loss to the ranks of male orange Persians was “Lifeguard,” formerly the property of Lady Marcus Beresford. This cat was almost unmarked, of a beautiful bright shade, and had an unusually round head and short face, with long silky coat. He was purchased by Miss Cartmell, who is well known as an enthusiastic breeder of orange Persians, but who never exhibits. This lady has been very successful in breeding numerous fine female orange cats, and many a winner has been born to blush unseen in the Barham Cattery, near Canterbury.

Another noted winner and stud cat is “Torrington Sunnysides,” of whom a portrait is given. This cat is the property of Mrs. G. H. Vidal, and has done a lot of winning. His colour is exceptionally good, and he has sired several prize kittens, some of which have been sent out to America and gained distinction over the water. “Torrington Sunnysides” has a most luxurious house in the spacious garden surrounding Mrs. Vidal’s residence at Sydenham. The photograph is by Mr. G. W. Vidal, who dislikes taking orange cats, because the tone is so difficult to reproduce in photography. Mrs. Davies, of Caterham, has owned some good orange cats. Her male “Hamish” was a grand specimen, but was only twice exhibited, when he gained highest honours. He was then purchased by Mrs. Vidal, and sent out to Mr. Storey in Chicago. A son of “Torrington Sunnysides” has also found a home in a Chicago cattery. “Red Knight” was sent by the writer to Mrs. Colburn, and in an article in the American _Field and Fancy_ mention

is thus made of him:— "'Red Knight,' an orange male, with deepest orange eyes, was imported from England. He is a very good type, and has sired some beautiful kittens, notably two by Miss Adams' 'Daffodil,' very fine specimens of pure orange, with cobby bodies, wide heads, tiny ears set far apart, and beautiful coats. They have been fed on 'Force,' and Miss Adams is going to call the male 'Sunny Jim.' Another son, seven months old, of the same parentage, is the largest cat ever seen for his age, and if he continues growing will certainly be enormous."

[Illustration:

ONE OF MRS. NEATE'S OUT-DOOR CATTERIES AT WERNHAM.]

One of Mrs. Vidal's orange kittens, "Puck" by name, is now owned by Mrs. Moxon, of Ilfracombe, from whom I have obtained a photograph for reproduction.

A few notes on orange Persian cats by Mrs. Vidal will be interesting to my readers:—

"It is difficult to imagine a more gorgeous colour than a really good orange lying full length in the sun. There is, however, rather a prejudice against them, chiefly because some people persist in calling them 'sandy' or 'red,' both of which names are quite misleading. I have several times had people say to me when visiting my cattery, 'I have always thought I did not like sandy cats, but I have never before seen a cat of such a lovely colour as the one you have just shown me.' Six years ago, when I first took up cat rearing, it was rare to see any orange cats at the shows, but now they and the creams form one of the most beautiful classes, and they have a specialist society of their own and an energetic secretary in Miss Mildred Beal.

[Illustration:

CURIOSITY.

(_Photo: Mrs. S. F. Clarke._)]

"There are two classes of oranges, one which has the ordinary tabby markings, more or less distinct, and the other which is 'flecked' all over the back in small patches, and which is usually not nearly so bright in colour as the so-called 'tabby' markings. The correct thing is to breed a totally unmarked orange; and, although many people claim this for their pets, it is very rarely seen. The absence of markings usually means absence of the rich orange colour so much admired. Any white on chin or bib is, of course, a blemish, and for breeding or show purposes such an animal is perfectly useless.

"An orange stud cat is a very useful animal to have in a cattery, for crossing with him will improve many colours, viz. tortoiseshell, brown, grey, and sable tabbies; while if he is mated to a blue queen the kittens, if orange, are beautiful in colour—brighter, I think, than if two orange cats are mated together. In mating with other colours it is a toss-up what colour will predominate, but the only way to ensure _all_ orange kittens is to mate with orange queens, when, according to my experience with my stud cat ('Torrington Sunnysides'), the results are _all_ orange. Mated with tortoiseshells the orange kittens are very good; but mated with blacks the strongest colour carries the day, and the kittens are mostly black or tortoiseshell, seldom orange. Silvers, chinchillas, and smokes should, of course, never be mated with oranges, as the result would be a horrible mixture! Orange queens were at one time very rare, and even now are not plentiful, being delicate and difficult to rear.

[Illustration:

ANOTHER VIEW OF MRS. NEATE'S CAT HOUSES.]

"The time at which the kittens change the colour of their eyes from the baby blue to orange varies a great deal in individual animals, from seven to twelve weeks. When the eyes are very deep blue, they change to bright rich orange or hazel; but if of a pale blue, they change very quickly to a poor yellow, and never get the rich dark orange which the deeper blue get. Therefore rejoice when you see your kittens with deep blue eyes. Some of our kittens have had the most lovely deep blue eyes, and great has been our sorrow as we found the inevitable change coming on. If I could only manage to get some kittens with the permanent blue eyes that the best white cats have, I should indeed be proud; but thinking of the kittens with terrible white chins and under-coats, which would crop up in every litter and would have to be drowned, quite deters me from sending my orange queens to white studs with blue eyes! All who have been accustomed to frequent the show pens will remember Miss M. Beal's splendid old orange queen 'Jael,' who up to the last, although nearly fourteen years old, always took first prize, and was a very good specimen of what an orange queen should be—of a bright rich orange, without any suspicion of light under her chin or chest (the usual weak point), and having

the splendid head, short nose, and good cobby shape which all breeders strive for. Short-haired orange cats are often seen about our towns and villages, and are always called ‘sandy,’ but are not, I think, held in much account. They are distinct from the so-called ‘red tabby,’ which is a recognised colour in our shows.”

[Illustration:

MRS. NEATE’S CAT HOUSES.]

Among the prize-winning females of the present day I must not forget to notice Mrs. Singleton’s “Orange Girl,” bred from Miss Beal’s noted strain. This cat has had many honours showered upon her during a very short career, and as there must always be a scarcity of queens in this breed, this fine specimen is a valuable possession.

So long as there are two cat clubs and two registers there will be a confused multiplicity of names, and so yet another orange male called “Puck” inhabits the cat world. This handsome fellow is owned by the Hon. Mrs. McLaren Morrison, to whom I had the pleasure of awarding first prize and many specials at the Botanic show held in June, 1902. His vivid colouring and well-shaped limbs and splendid eyes will always make him a conspicuous specimen in the show pen. Alas! his photograph does him but scant justice. Quite a surprise packet appeared at the Crystal Palace show of 1902 by the appearance of a very handsome young male in “William of Orange” exhibited by Mrs. Stillwell, and bred from Dr. Roper’s noted black “Johnnie Fawe” and tortoiseshell queen “Dainty Diana.” This cat was awarded first and many specials, and was claimed by Lord Decies at catalogue price. As “William” was not a year old when he won his laurels, it may readily be believed that he has a distinguished career before him, and may add another to the long list of winners owned and exhibited by Lady Decies. No orange male cat is better known in the fancy than that splendid fellow “The King’s Own,” belonging to Mrs. Neate. He has had a most successful career, and may be considered as nearly self-coloured an orange as any yet exhibited.

Mrs. Neate is a devoted admirer of this breed and also a great cat lover, and has recently started an arrangement for boarding cats, and truly I know of no place better adapted for successful cat keeping than the home of Mrs. Francis Neate, at Wernham, near Marlborough; situated as it is in the very heart of the country, a mile from any other house, her cats can enjoy their liberty with perfect safety.

A large range of brick-built and slated outhouses has been converted into catteries and comfortably fitted. All have wooden floors, wire doors, and large runs attached. A number of portable houses and runs are dotted about the kitchen garden and meadows. An empty cottage serves as an isolation hospital, or place of quarantine for cats returning from shows.

A herd of pure-bred goats supply the inmates of the cattery with milk, and rabbits, which abound, form their staple food when in season. The largest of the outhouses is fitted with a Tortoise stove, carefully guarded. The pride of Mrs. Neate’s cattery is, of course, the famous orange stud “The King’s Own.” He is the sire of the two winning orange queens “Mehitabel of the Durhams” and “Glory of Prittlewell.”

Fitting mates for him are “Wernham Titmouse” (tortoiseshell-and-white), “Evening Primrose” (a cream daughter of “Champion Midshipmite” and “Hazeline”), also “Mimosa” (an orange bred by Miss Cartmell from “Richmond Bough” and “Mistletoe”): these occupy the house adjoining the stables.

“Champion Bundle” and “Betsy Jane,” a lovely little blue with glorious orange eyes, are the only blues of the establishment. Latterly Mrs. Neate has reduced her own stock of breeding queens, and makes a speciality of receiving cats during the holidays. Judging by the number of cat fanciers who sent their pets to Mrs. Neate during the summer of 1902, it is certain that a great want has been most efficiently supplied. Not only does Mrs. Neate give personal supervision to her catty boarders and visitors, but they have splendid caretakers on the premises. These custodians are Mrs. Neate’s big St. Bernard and a chow-chow, who jealously guard the Wernham cattery. These dogs are on the very best terms with the feline inmates, and the strange pussies very soon appear to settle down to an amicable cat-and-dog life. The accompanying photographs, as will be seen, were taken in the depth of winter. These brick-built houses, slate roofed and with wooden floor, are splendidly adapted for keeping the cats snug and warm during the cold weather. One of the buildings illustrated is 25 feet by 15 feet, and has three windows. This house is provided with large table, shelves, and chairs, and cosy sleeping boxes. An outside wire run, of the same length and width as the building, is erected for an exercise ground in summer weather.

Mrs. Neate has kindly supplied me with a few notes on orange Persian cats:—

“It was in 1897, at Boscombe show, that I claimed the winner in a class of twenty-six kittens, my now well-known orange Persian stud ‘The King’s Own.’ The same year, at the Crystal Palace, I purchased a lovely orange female kitten sired by Mrs. Pettit’s ‘Champion King of Pearls’ and the tortoiseshell-and-white ‘Dainty Doris.’ From her I fondly hoped to establish a breed of blue-eyed oranges, which feature would be charming in the variety; but alas! she came home to sicken and die, as so many another valuable kitten has done, and I have never since been able to obtain an orange of either sex sired by a blue-eyed white.

“It is most difficult to breed oranges without white lips and chins; the pink nose, too, is a feature in the breed that I do not like.

“I have found crossing an orange male with a cream female the surest way to breed sound-coloured specimens of both sexes and varieties, _e.g._ ‘Mehitabel of the Durhams’ (a really rich-coloured unmarked orange queen, and quite free from the objectionable light shading on lips and chin); she was bred by Mrs. D’Arcy Hildyard from her cream female ‘Josephine of the Durhams’ and ‘The King’s Own.’ Again, from a blue male and a tortoiseshell queen you are more certain of breeding good oranges (though seldom of the female sex) than from mating tortoiseshell and orange together; in the latter case more often than not black kittens predominate in the litter, and there is rarely, if ever, an orange female amongst them.

“Mrs. Vidal’s famous orange stud ‘Torrington Sunnysides’ was a son of my light blue ‘Champion Bundle’ and a tortoiseshell dam ‘Torrington Owlet,’ herself of an orange strain. Mrs. Walford Gosnall’s ‘Rufus’ (whose name discloses his colour) was also the result of this union. ‘Red Ensign,’ the orange kitten who won first and three specials at Westminster in 1902, was bred by me from ‘Champion Bundle’ and ‘Mimosa,’ an orange queen of cream breeding, and with his litter brother ‘Scarlet Lancer’ took first and silver medal for the best pair of kittens. The latter is now the property of Miss Cartmell, and has grown into a fine cat. Unfortunately for the cat fancy generally, ‘Red Ensign’ was claimed at the show, and is now a house pet.

“The best orange kittens I have bred were from my ‘Wernham Titmouse,’ a tortoiseshell-and-white who owns an orange dam, and ‘The King’s Own’; the whole litter were females, and redder than any oranges I have seen. These never lived to see a show, and their death was one of the greatest disappointments I have experienced in my career. The demand for good orange and cream females is greater than the supply; in fact, these colours are decidedly ‘booming,’ and better classification is given for them at our principal shows.

“At the Crystal Palace show of 1898 there were only four entries in the open class for orange and cream males, and four of the same varieties in the female class, compared to the ten entries in orange and cream male classes and the same number in the female classes at the Cat Club’s show, held at Westminster, 1902. These facts speak for themselves of the increased interest now taken in these varieties.

“Unlike some of the warmer tinted of us humans, orange cats of both sexes are particularly sweet-tempered, showing great attachment to their owners. They are of strong constitution and attain to great size, being at present free from the in-breeding that is practised amongst many other varieties of our show cats. A small piece of sulphate of iron in the drinking water will enrich the colour of orange and tortoiseshells, besides being an excellent tonic, especially during the moulting season.

“Orange Persian cats do not, as a rule, make good photographs, as they lack expression compared to the short-haired tabby varieties of this colour.”

The Misses Beal, of Romaldkirk, near Darlington, have long been associated with orange and cream cats. “Jael” was quite unique as an orange female, and at fifteen years of age could yet win in her class by reason of her grand colour, perfectly shaped head, short face, and tiny, well-set ears. Such a cat stands out in any breed, and such a cat may never again be bred. “Jael” died in 1902, after a long and successful career.

[Illustration:

MUSING.

(_From a Painting by Madame Ronner._)]

Miss Beal’s male orange “Minotaur” is one of the most beautiful cats of this breed now exhibited, and has quite the best round head and face, with sweetest expression. These are qualities too often lacking in orange cats.

Miss Beal’s name is, perhaps, more closely associated in the cat world with cream cats, and in my next chapter on this breed she has kindly supplied some notes.

Another fancier of both orange and cream cats is Mrs. D'Arcy Hildyard, and to her I am indebted for the following notes on orange Persian cats:—

"Until comparatively lately I confined myself entirely to the breeding of creams, and my efforts were attended with considerable success, both in multiplying the number of cats of that colour—I bred thirteen one year—and in filling the classes given for cream females. I was particularly lucky in breeding many creams of the gentler sex.

"The birth of the Orange and Tortoiseshell Society fired me with ambition to start breeding oranges. I was much fascinated with the colour, though I hate their being penned beside the creams at shows, as they completely take all colour out of the lighter animals and give them a washed-out appearance. I started by crossing my cream queen 'Josephine of the Durhams' with Mrs. Neate's famous 'The King's Own.' This proved a most satisfactory cross, the results being three rich-coloured unmarked orange kittens, one male and two females. I sold one female to Miss Scratton, of Prittlewell Priory, and it has, I hear, grown into a very handsome cat; the other two I kept, and they won all before them at Manchester Kitten Show, 1901, and were shown at Slough after, where the male was claimed. The remaining one, 'Mehitabel of the Durhams,' I kept, and she won me many prizes last winter, and being mated this year to 'Champion Romaldkirk Admiral' has presented me with a litter of two creams and an orange. Certainly creams and oranges cross well, and often I think produce a brighter and deeper tone of colour than is obtained from other shades. I have lately purchased an orange tom, and by crossing him with 'Hazeline,' one of my cream queens, have got a splendid litter of seven pure oranges. This, I think, proves that the cream and orange cross is good, and that they breed very true. Oranges bred by crossing other colours seem to me rather spasmodic, if I may use the term. When breeders try crossing an orange and a tortoiseshell they very often get blacks and blues as well as oranges; on the other hand, from a blue and a tortoiseshell cross sometimes an orange is obtained. But they do not seem able to count exactly on the results.

"Reliability is what I claim from the cream and orange cross. I emphatically believe in mating creams to creams if you wish to get a good pale colour and few markings, and oranges and creams crossed have certainly produced good specimens of both colours for me. I speak from my own experience.

"I hope to do great things by trying a cross between my orange tom 'Benjamin' and 'Mehitabel.' Miss Winifred Beal's 'Minotaur' was the result of a cross between a cream and a tortoiseshell. Her well-known 'Garnet' is the daughter of a cream and a blue. At present there is, to my mind, no orange female on the show bench to compare with the late 'Jael,' owned by Miss Mildred Beal, whose brilliant colour and perfect head with its tiny ears made her hold her own at all the shows up to within two months of her death at quite a venerable age; but I hope in the future, as oranges become more popular and breeders work hard at producing good specimens, we may see her like again. I was much taken at Richmond show with Mrs. Singleton's 'Orange Girl,' and also with the kitten of that colour exhibited by the same lady at Manchester. Every year, I think, shows that the general world is becoming more alive to the beauties of orange and cream cats, as proved both by the large increase in entries of these colours at the principal shows and the great demand for kittens when any are offered for sale. Undoubtedly breeders owning creams should stick to them, if they wish to produce good oranges—see the many splendid specimens sired by 'Midshipmite' and 'Admiral.'

"It is a hard matter to say decisively what tint orange kittens should be when born. I have known them enter the world a bad cream, and gradually grow redder till they develop into the brilliant colour we all look to see in a cat of orange hue. Personally, I prefer them born a dark shade; they usually lighten and brighten a little, but on the whole I think that is the more satisfactory of the two. It is distinctly discouraging to see a washed-out looking kitten when you are expecting a bright orange one.

"Fanciers differ about the eyes which are supposed to be correct in this breed. Hazel eyes are universally acknowledged to be the right thing. Personally, I admire green, or rather _eau-de-nil_ eyes, as giving more contrast to the colour of the coat, but you do not often see them. I have always wished to breed a cream with blue eyes—I do not mean the baby blue, but the colour that Siamese have—and only the other day I sold a kitten three months old with brilliant blue eyes of this tint, and shall be anxious to know whether they change in time or not.

"I think the time is approaching when the orange and cream cats are going to be among the most attractive classes at our bigger shows. Already the classes are much better filled than when I first joined the fancy, and you always find an admiring crowd in front of their pens. I wish, though, that a nice sprinkling of blues could always be placed between the two colours at shows. The close company of the oranges is so excessively unbecoming to the creams, while when you see the three colours together they are especially lovely. To see cream and orange cats at their best they should be at large in the country and running about on the green grass."

[Illustration:

OUT IN THE COLD.

(_Photo: E. Landor, Ealing._)]

In 1902 an Orange and Cream Cat Club was started by a few enthusiastic breeders of these varieties over in America. The Misses Beal, Mrs. Vidal, and Miss Frances Simpson were elected as honorary members. The following is an extract from _Field and Fancy_, the American weekly paper:—

ORANGE CATS.

There is very little doubt that this is a colour that has from the beginning of the fancy in America been very popular, and has had a very strong hold upon the American love for colour. But, of course, as is generally the case with the popular ones, the supply has never been too plentiful, and probably never will be as regards the queens, for they only appear once in a while, according to what seems to be one of Nature’s rules, that the queens should be tortoiseshells.

The Orange and Cream Club is probably destined to do a great deal for the variety, which is one of the colours from which it takes its name. Breeding orange cats opens quite a field, for in attaining your end you can at the same time indulge in other colours, for undoubtedly a cross with a tortoiseshell will be found necessary to keep the colour sufficiently intense, and at other times it may be quite as well to throw in a little black. The tendency for the queens to be tortoiseshells may possibly be somewhat overcome in time, but these inherent traits in colours in animals and birds are often so strong that they have a knack of reappearing even after several generations. We occasionally see queens of the orange colour, and these are usually high quality ones, both in colour and type; but the orange queens are not destined to at present make heavy classes by themselves. Though the standard calls for orange eyes, it is a curious coincidence that the most consistently successful cat of recent times has been Miss Beal’s “Jael,” who had green eyes; but so good was her colour, so good her type, that she generally won when exhibited.

The struggle carried on in the British Isles for some years to breed these cats without marks has been hardly a success, and there have not been very many evolved of that colour that were really without marks, and it is a great question if in this craze for absence of marks they have not been passing by a lot of good cats. As far as we personally are concerned in the matter, we see little to be gained by the absence of marks in the orange cats. If the colour had been very prolific in numbers it might have been a good idea to try and split up the classes, but they were never too well filled, and there is room still for plenty more, though we cannot complain so much at the representation that they have had in America last season, either in numbers or quality.

HIGHER EDUCATION.

(_Photo: Mrs. S. F. Clarke._)]

CHAPTER XVI. CREAM OR FAWN PERSIANS.

This may be said to be the very latest variety in Persian breeds, and one which bids fair to become very fashionable. The term “cream” describes exactly what is the desired tint of these cats, but few and far between are the specimens which are pale and even enough in colour to be correctly described as creams. No doubt, in times past now and again a cream cat would be seen exhibited in the “any variety” class, but then they might be designated as freaks or flukes. Now, however, fanciers of these cats have a system in their matings, and therefore, as a result, there is a breed of cats established which until late years were not recognised or classified.

[Illustration:

MRS. CLINTON LOCKE’S CREAM KITTEN.]

It is true that the cream Persians seen in the show pens are often much darker than is implied by the name, and, indeed, are really fawn-coloured. The great thing, however, is to obtain an even tint throughout, whether dark or light, and to avoid any patches, streaks, or tabby markings. I think the very pale creams are more dainty and fascinating than the darker cats, but the lighter the coat the more difficult it is to obtain perfect uniformity of colour. Of course, there will always be a certain amount of shading in

cream cats—that is, the spine line will be slightly darker, shading off on the sides and under the stomach and tail. I think that creams are making more rapid strides towards attaining the “almost unmarked” stage than are silvers. Certainly, good creams of to-day are very slightly barred on head or legs or tail, and this cannot be said as regards some of our best silver cats. This is probably to be accounted for by the cautious and wise discrimination used in mating creams by selecting blues or tortoiseshells, and thus avoiding tabby-marked cats. It is a peculiarity of cream cats that the eyes are generally almond-shaped, and are set rather slanting in the head. It is rare and a great treat to see bold, round, owl-like eyes in cream cats. These in colour should be golden or hazel, the brighter the colour the better. I will here give the points of cream or fawn cats, as drawn up by the specialist society:—

CREAM OR FAWN.

Colour.—To be as pure as possible without marking or shading, either paler or darker, dulness and white to be particularly avoided. All shades from the palest fawn to be allowable. 25.

Coat.—To be very long and fluffy. 25.

Size and shape.—To be large—not coarse, but massive, with plenty of bone and substance; short legs. 20.

Head.—To be round and broad, with short nose, ears small and well opened. 15.

Eyes.—To be large and full, and bright orange or hazel in colour. 5.

Condition.—10.

[Illustration:

A CREAMY SMILE.]

Much has been done by this energetic specialist society to get a better classification for creams at our shows; and perhaps, as time goes on and a larger number of fanciers take up these breeds, a distinct classification will be given for creams and fawns. It may always be a little difficult to draw the line between the two; but such a division of colours would, I think, give satisfaction to the breeders of both creams and fawns, for at present judges are more inclined to give a preference to the palest-coloured cats, perhaps because more beautiful and more difficult to breed.

In the former breeds, more especially blues and silvers, that I have described in this work it would have been impossible to name all those cats that were noted in the fancy, for the simple reason that their name is legion; but it is different in a breed like creams, for, as I mentioned in the beginning of this chapter, in times past it was a case of only here and there a cream Persian appearing on the scene, then vanishing perhaps to America, or else being purchased for a pet and retiring from public life. These “sports” in the fancy were not seriously taken up, and no one thought of trying to establish a strain; so that one can, as it were, put one’s finger on the cats of this variety, if not so easily in the present day, certainly in the past.

The first recorded cream Persian in catalogues or stud books is “Cupid Bassanio,” born in 1890, bred by Mrs. Kinchant; no pedigree is given. He was a big, broadheaded, heavily coated cat, with a good many marks and shadings, and was sold to Mrs. Preston Whyte, and passed on to Miss Norman. In the same year Mrs. Kinchant exhibited cream kittens at Brighton. “Ripon” was another well-known cream of imported parents (a blue and an orange). This cat was purchased from Mrs. Foote by Lady Marcus Beresford, and eventually disappeared when in the possession of Miss Cockburn Dickinson. Mr. McLaren Morrison in 1893 owned a pale cat called “Devonshire Cream.” In the following year Miss Taylor bred a splendid specimen from “Tawny,” her noted tortoiseshell. This cat, called “Fawn,” was an absolutely self-coloured fawn with brown eyes, and would do some winning if alive now to compete in our up-to-date classes for cream or fawn. It was in 1895 that Miss Beal first exhibited some of her creams, upon which at that time she did not set much store, more interested as she was in blues; but of her now celebrated strain more anon.

[Illustration:

MRS. F. NORRIS’S CREAM KITTEN.

(_Photo: E. Landor, Ealing._)]

One of the best known creams of late years is “Zoroaster,” bred by Mrs. Bagster from her tortoiseshell “Pixie.” This was a remarkably large pale cat with glorious eyes, but he was a good deal patched in colour when I saw him at Mrs. Mackenzie Stewart’s

cattery. Mrs. Cartwright bred a well-shaped light cream, “Upwood Junket,” by “Timkins,” a blue, and a daughter of “Cyrus the Elamite.” Mrs. Davies, of Caterham, has often had creams in her possession, notably “Lord Cremorne,” quite one of the palest seen in the show pen. Two noted creams now placed at stud are Mrs. Norris’s “Kew Ronald” and Mrs. Western’s “Matthew of the Durhams.” Both these cats are bred from Miss Beal’s famous “Heavenly Twins.” Regarding “Matthew,” a reporter in _Our Cats_ thus writes after the Botanic show of 1901:—“Creams are, we prophesy, the coming cats. There seems to us great possibilities in this variety. ‘Matthew of the Durhams’ is one of the cats we would bring forward in support of this view. Eminently aristocratic, breathing an air of refinement, this cat might be the petted darling of a princess whose cats are all selected by a connoisseur.” Mr. Western is justly proud of his purchase, for he claimed this fine cat at the Sandy show, 1901, when he was exhibited by Mrs. D’Arcy Hildyard. “Matthew” has on four separate occasions taken second to his father “Admiral’s” first. He has sired some lovely creams, notably “Wynnstay Myrtle,” also owned by Mrs. F. Western. This female is one of the best of her breed, and is sure to have some influence over the creams of the future. At the Crystal Palace show of 1902, where she was awarded first and many specials, she was the admired of all admirers. As a rule, cream females have been very much behind the males in quantity and quality. Almost the first two were bred by Miss Hester Cochrane from “Cyrus the Elamite” and “Brunette.” “Crême d’Or” is quite one of the best, and was owned by Mrs. Wellbye, who sold her to Mrs. Norris. This cat declined to enter into any matrimonial alliance for some time, but at last presented her owner with a family by “Darius,” Mrs. Ransome’s noted blue. Two of these cats, “Kew Laddie” and “Kew Ronald,” are well known in their different spheres. “Kew Laddie” I purchased to send out to Mrs. Clinton Locke, in Chicago, and she presented him to the honorary secretary of the Beresford Club, Miss Johnstone. This lady exhibited “Laddie” at the big Chicago Cat Show, where he won high honours, and in a letter received from Miss Johnstone I learn he is growing a grand fellow and, in fact, is quite _la crême de la crême_ in catty society over the water.

The picture of a perfect kitten on the opening page of this chapter represents a cream female, “Jessica Kew,” bred by Mrs. Clinton Locke from “Lockhaven Daffodil,” sired by Miss Johnstone’s “Laddie Kew.” Mrs. Clinton Locke is justly proud of this lovely kitten, and writes: “Jessica is the finest kitten I have ever seen; all her points are perfect. She was five weeks old when this photo was taken. Her grandfather was my ‘Victor,’ an orange, her great-grandmother a tortoiseshell-and-white.”

[Illustration:

“KEW RONALD” AND “KEW LADDIE.”

(_Photo: E. Landor, Ealing._)]

I have mentioned Mr. F. Norris as a breeder of creams and the owner of the handsome pair of cats illustrated on this page. He has kindly supplied me with the following notes:

“Cream cats are of a modern colour in Persians, but are now being more freely bred and finding numerous supporters.

“There are, however, very few good ones in the fancy, for size and colour are difficult to obtain. The great failing with them is that, although they are called cream cats, the best and soundest coloured ones are really of a fawn shade. So many show markings, patches, or shadings, whereas the colour should be one shade and sound throughout; better be a little dark in colour rather than shade from cream to white, as is the case with so many specimens exhibited.

[Illustration:

MISS BEAL AND HER KITTENS.]

“For one grand-headed and good-eyed cat you see a dozen snipy, long-faced ones with curious slit eyes, instead of a short, snub head, with glorious big round golden eyes.

“In my opinion, to get the short head, good eye, fine body shape, and short legs, it is best to mate a cream with a good cobby blue. From my experience nothing beats a blue, although you can mate them with a red, tortoiseshell, or black. Mating two creams together I do not advocate, unless one of them has a distinct out-cross in the first generation to totally different blood.

“All the creams shown are descended from Miss Beal’s two brothers ‘Romaldkirk Admiral’ and ‘Romaldkirk Midshipmite,’ and to keep the colour, breeders have bred in and into them again; and that is why they have lost so much in type and character, which would have been improved by using an out-cross.

“I have heard people say, ‘Cream females will not breed.’ If they only studied the question a minute, they would know the reason well enough, which is that they have been too much in-bred. If breeders will only try the blue cross more, they will, I am sure, be pleased, and we shall see a better cat being shown. Breeding from blue you will get pure creams and some cream and blue mixed. Keep the blue and cream females, and when old enough mate them to a cream, and you will get some fine sound-coloured cream kits.

“It is very curious that there has been nothing yet bred in males to beat the twin cats ‘Admiral’ and ‘Midshipmite.’

“In females the best I have seen is ‘Miriam of the Durhams,’ who has a lovely body and coat, but is long in face and has those bad-shaped eyes. ‘Crême d’Or’ runs her close, as she has such a good head, with perfect eye, but is a wee bit long in the leg.”

Miss Beal’s females “Calliope” and “Mignonette” were both noted prize-winning cream females. Mrs. D’Arcy Hildyard has been most successful in her endeavours to breed creams from creams, and a letter from her in _Our Cats_ of April, 1901, will be interesting to breeders of this variety:—

[Illustration:

MRS. D’ARCY HILDYARD’S CREAM KITTENS.

(_Photo: E. Yeoman, Barnard Castle._)]

BREEDING OF CREAMS.

SIR,—Being much interested in the breeding of creams, I should like to say a few words on the subject and state my experience. Though only a novice, I have up to date succeeded in breeding twenty creams—two in 1899, thirteen in 1900, and seven this year. I began by mating my mixed blue and cream queen “Senga” to a cream tom “D’Arcy,” which I bought from Mr. Hutchinson, of Egglestone. From this pair I got four kittens, all females—two cream and two marked blues. I kept the creams “Josephine” and “Hazeline,” winners at Westminster as kittens, first and second special and medal, 1900. Later on in the year I mated them, “Hazeline” to Miss Beal’s “Midshipmite,” “Josephine” to her “Admiral.” Both litters were entirely cream, “Josephine” producing six kittens, “Hazeline” producing five, two of which I have kept. “Matthew” and “Miriam of the Durhams” both won as kittens at Manchester, and “Miriam” has since taken first and specials at Barnard Castle, Westminster, and Reading. “Matthew” is growing into a very handsome cat, and I hope to exhibit him at the Botanic. On Saturday last, April 13th, “Hazeline” again kittened and produced five creams, having again been mated to “Midshipmite.” This I think distinctly proves that good creams can be got from a pair of the same colour. On April 14th “Senga” also presented me with two more creams, also two marked blues, this time the result of a mating with Miss Beale’s “Romaldkirk Toza.”

AGNES D’ARCY HILDYARD.

Mrs. Barton Collier has two good creams, “Bruin” and “Dolly of Brough.” Again these cats are from Miss Beal’s strain, the male being a fawn and the female quite one of the palest of creams.

Miss H. Cochran, who formerly took a great interest in this breed, writes:—“I should be inclined to mate a pale cream male or female with a white, and the progeny with an unmarked orange, or _vice versâ_. I had a litter from ‘Buttercup’ and ‘Zoroaster,’ consisting of two oranges, two fawns, and a cream. The fawn and creams were females, but all died in their youth. I made other attempts with similar crosses, as I had been told it was impossible to breed cream queens, and in the first year all the creams were queens, and the males red! My idea was to select a male of the required colour, and mate a queen of suitable breeding with him, then to mate the resulting queens with their own father. I believe this plan would have been a success if I had followed it up. My idea is that the natural males are the fawns and oranges, and that their complementary queens are the blue tortoiseshells and the ordinary tortoiseshells. No harm is ever done to a cream or orange strain by crossing with black, and it may do much good to the latter by deepening the colour of the oranges, and promoting patchiness as opposed to streakiness in the tortoiseshells.”

[Illustration:

“MIRIAM OF THE DURHAMS.”

(_Photo: E. Yeoman, Barnard Castle._)]

I have made frequent mention of Miss Beal's noted creams during my chapters on orange and cream cats. These two celebrated champions are commonly known in the fancy as the "Heavenly Twins," their registered names being "Romaldkirk Admiral" and "Romaldkirk Midshipmite." They are really fawn Persian cats, very sound in colour, well made, big boned, and are always exhibited in the pink of condition, and at all seasons of the year are in marvellous coat. Certainly, the cold climate of the Romaldkirk cattery, which is situated 730 feet above the sea level, must, anyhow, suit this variety of Persian cat. I suppose the day will come when these welltried and well-seasoned veterans will have to retire from public life and make way for some of their already noted offspring. In the North, South, East, and West these "Heavenly Twins" have reigned supreme, and Miss Beal must almost have lost count of the number of prizes won by them, which, I think I am safe in saying, would give an exact record of the number of times exhibited. In response to my request, Miss Beal has sent me some notes regarding her cattery arrangements. She says:—

[Illustration:

"CHAMPION ROMALDKIRK ADMIRAL."

(_Photo: G. W. Vidals._)]

"Most of the houses are old farm buildings round about our stable yard, and I have recently utilised an old granary which is over the coachhouse. This is about 40 feet long, and has a room at one end, with five windows and good ventilation above. In addition I have three big cat houses and a loft, where most of the queens reside. 'Middy' and 'Admiral' (the 'Heavenly Twins') have small wooden houses, felted inside and out, with wired runs and concrete floors.

"I have the use of two laundries and a tool-house fitted with fireplaces, and these I reserve in case of illness."

There are no cats exhibited in better coat and condition than those that come from the Romaldkirk cattery, and the Misses Beal may be justly proud of their splendid specimens of creams, oranges, tortoiseshells, and blue Persians. Miss W. Beal has kindly supplied me with a short article on cream and fawn Persians:—

"The cream and fawn Persian was a few years ago looked upon as a 'sport,' and when cream kittens appeared in an orange strain they were considered spoilt oranges, and were either given away, sold for a few shillings, or in many cases destroyed as useless. Now, however, it is very different; there is a growing demand for cats and kittens of this colour, and at the big shows they usually have two classes, _i.e._ male and female, for them. They were certainly slow in coming into general favour, owing, I think, to the following facts: First, that the specimens formerly exhibited failed very noticeably in head, being very narrow in face and long in nose; secondly, that cream females were practically unknown; and, thirdly, that a show, where they are generally seen, is emphatically the worst place to see cream Persians to advantage, as the journey and being in a town, etc., takes off the spotlessness of their coat and dulls their colour, and the dingy grey of the pens and the yellow of the straw combine to spoil the effect of their colour.

"The place, without doubt, to see creams to perfection is the country, where against a background of vivid green lawn their pure, soft colouring is indeed a thing of beauty, and rarely fails to command admiration. The colour is rather difficult to describe, and there are two distinct tones of colour bred, the one which is generally seen and is so far most successful at shows being a cream rather deep in shade, almost buff, with a distinct pink tinge about it, which is very different from the washed-out orange or sandy colour some people imagine it to be. The other tone of cream colour is much paler in shade, but, instead of the pink, it inclines to a lemon tinge, and, though paler, it is, as a rule, more 'flaky' and uneven than the darker shades, and it is also very apt to fade into white underneath.

"Nearly all the best-known creams are bred in the first place from orange and blue strains, though creams have appeared as freaks in many colours—silvers, tabbies, etc.; but I believe the present strains sprang from crossing blue and orange, and you can _generally_ rely on getting some creams by crossing a tortoiseshell, cream, orange, or blue tortoiseshell queen with a blue sire. But, so far, reversing the mating, _i.e._ a blue queen with a cream or orange sire, is not successful from the cream breeders' point of view, though very good from that of those breeders who want blues, as the kittens generally excel in purity of colour. Cream females are now fairly common, and so in a few years there ought to be a well-established strain of cream-bred creams; but, as in all other breeding for colour, people are apt to get surprises—for instance, one strain of cream females mated to a cream sire invariably produces whole litters of creams, while another strain, more cream-bred than the first named, mated to the same sire produces equal numbers of creams and orange and creams. If people wish to start breeding creams, and cannot afford a cream female, it is a good plan to buy a well-bred nondescript coloured female, either blue and cream, tabby, tortoiseshell, or anything that

has cream or orange about it, and if it is properly mated there are nearly sure to be one or two creams: thus a cream strain can be gradually built up.

“There are several things to be remembered in trying to breed good creams. One point to be aimed at is to keep the colour as _level_ as possible, whether it be of a dark or light shade, and to keep it pure, not tinged with blue or dull. Among other faults to be bred out are the light lip and chin, which are very common defects, and the long head, which is still seen sometimes, though creams have improved vastly in this respect in the last few years. Creams have been taken up greatly in America as well as oranges, and there they seem to be formidable rivals in popularity to the silvers, which have so far over here outdone them in that respect.

“One great point in favour of creams is their hardiness, for they do not possess the delicate constitutions which seem to belong to most of the other very pale varieties of Persians. With other coloured cats—blues, silvers, etc.—creams make a splendid contrast, and with oranges add greatly to the effect of a group. They also cross well with several colours—blue, black, tortoiseshell, etc.—for breeding; and many breeders think the result of the growing fancy for these colours, _i.e._ cream and orange—for, though so different, they are hard to deal with separately—will be that they will be better catered for at shows as to classes, and more extensively bred than they are at present.”

CHAPTER XVII. TORTOISESHELL PERSIANS.

Many years ago, when I first took up the cat fancy, I used to think tortoiseshells ugly and commonplace, and I am afraid even now I have not that admiration for the breed which I feel a really good specimen of this variety ought to inspire. To begin with, it is seldom that a true type of long-haired tortoiseshell is seen or exhibited, and perhaps this may account for the breed being so much neglected. They are not taking-looking cats, and make a poor show in the pen. I have often remarked, however, that this is a favourite breed with the sterner sex, and that our professional men judges will almost invariably pick out a tortoiseshell when judging an “any other colour” class, and give it some mark of distinction. This may be accounted for by the fact that, of all varieties, a really good tortoiseshell is most difficult to breed, and therefore any specimen approaching perfection should be encouraged. There are splashed and sable tortoiseshells and tortoiseshell tabbies, all handsome cats of their kind, but not the genuine article. Real tortoiseshells may be called tricolour cats, for they should bear three colours, like a tortoiseshell comb, on their bodies, namely black, red, and yellow, in distinct patches or blotches, solid in colour and well broken up, with no trace of stripes, bars, or tabby markings. A brindling effect is to be avoided, and a white spot on chin is a great blemish. It is most undesirable that the black should predominate, in which case the specimen will lack brilliancy. The three colours should, if possible, be pretty evenly distributed over the body, legs, and tail, and should not run into each other. The red and yellow may preponderate over the black with good effect.

A blaze, so-called, up the face is considered correct, and this should be of the red or yellow, and in a straight line from the nose upwards. This is a very distinctive feature in the breed, and one that judges will look for in a good show specimen. It is incorrect for the tail to be in any way ringed with the colours. The texture of the coat is often coarser and more hairy in this breed, and it is not usually so long and flowing as in other varieties of Persian cats. There is no difference of opinion as to the correct colour for the eyes of tortoiseshells. They should be a bright golden or orange, and these seem in perfect harmony with the colouring of the coat. Tortoiseshells never attain any great size, and may be called a small breed of Persian cats. I give the list of points as drawn up by the specialist society:—

TORTOISESHELL.

Colour and marking.—The three colours—black, orange, and yellow—to be well broken and as bright and well defined as possible; free from tabby markings, no white. 30.

Coat.—To be silky, very long, and fluffy. 20.

Size and shape.—To be large—not coarse, but massive, with plenty of bone and substance; short legs. 25.

Head.—To be round and broad, with short nose, ears small and well opened. 15.

Eyes.—To be large and full, and bright orange or hazel in colour. 5.

Condition.—10.

They are quite one of the most interesting from which to breed, and experiments can be tried successfully in crossing a tortoiseshell queen with black, cream, orange, and blue cats. The litters will often be a study in variety. I have known one family to consist of a black, a white, a cream, an orange, and a blue! The owner of such a litter would have something to suit all comers. A really good tortoiseshell queen may, therefore, be considered a valuable property. And what of a tortoiseshell tom? A mine of wealth would such a possession be to any fancier. Among short-haired cats a tortoiseshell tom is a rare animal, but I do not think a long-haired specimen has ever been seen or heard of. Several experiments have been tried, but it remains for some skilful and scientific breeder to solve the problem of the manner and means to be employed to produce males of this breed. The classification at our smaller shows for tortoiseshells is generally of a meagre and discouraging description. There are so few specimens that executives of shows fight shy of giving a class for even tortoiseshell _and_ tortoiseshell-and-white together. So tortoiseshells are mixed up in the “any other colour” class, and therefore this breed can seldom, if ever, be really judged on its own merits, or comparisons made between the different specimens that are exhibited. At our largest shows there are classes provided, which, however, are poorly filled.

Tortoiseshells may be said to have had no past. There are no celebrities in feline history save and except “Queen Elizabeth,” and not only was she the finest of her breed, but she also made her name famous by severely injuring Mr. W. R. Hawkins, who was examining her when making his awards; and I have good reason—or rather bad reason—for recollecting her, on account of her fixing her teeth into my hand when I was removing her from her basket to pen her at the Westminster show in 1899. It seems that she had a great objection to travelling, and resented making an exhibition of herself in public! She was a grand specimen, however, and, besides always carrying off highest honours herself, she was the mother of many prize-winning orange and tortoiseshell cats, amongst others “Prince Charlie,” “Prince Lyne,” and “Mattie.” I have failed to obtain a photograph of this celebrated cat; and, even had I succeeded, a tortoiseshell makes a terribly poor picture when reproduced in photography, for the reason that the yellow comes out only fairly light, the orange appearing as dark as the black patches.

[Illustration:

MISS H. COCHRAN’S TORTOISESHELL “BRUNETTE.”]

Miss H. Cochran had a dear old pet puss called “Brunette,” a dark tortoiseshell, and from her were bred some of the first cream females ever exhibited. The Hon. Mrs. McLaren Morrison has a good tortoiseshell, “Curiosity” by name. The best three specimens now before the public are Dr. Roper’s “Dainty Diana,” Miss M. Beal’s “Pansy,” Miss Kate Sangster’s “Royal Yum Yum,” and Mrs. Bignell’s “Topsy of Merevale.” As regards the last-named, Mrs. Bignell has kindly supplied me with particulars of “Topsy’s” litters when mated with different-coloured cats. “Topsy’s” first litter in 1896, when mated to the “Duke of Kent” (a blue), was two creams and two smokes. When mated to “Johnnie Fawe” (a black) her kittens were all of the father’s dusky hue. Again, when crossed with another blue male her litter consisted of two orange males and a tortoiseshell female, and again to the same cat one black male and two orange males. “Topsy” is a noted prize-winner, and one of her smoke children, “Lucy Claire,” went out to Chicago, and is considered the finest smoke specimen in the American fancy. Dr. Roper’s “Dainty Diana” is one of the best-known tortoiseshells, and her colouring as good as any exhibited; she is the mother of many winners. Miss Kate Sangster, who is a great admirer of this breed, writes: “My ‘Champion Royal Yum Yum’ was bred from a black and a tortoiseshell, and her grandsire was a cream. She is over seven years old, and has had twenty-two kittens, namely, five cream, five blue, five orange, four black, and three tortoiseshell.”

[Illustration:

“TOPSY.”

OWNED BY MISS SARGENT.

(_Photo: J. P. Bennett, West Norwood._)]

Miss Mildred Beal, who with her sister is so well known in connection with cream and orange cats, is also the owner of some fine tortoiseshells. “Wallflower” (well so named) is the mother of a noted prize-winning cream called “Sunlocks.” “Pansy,” Miss M. Beal’s special pet, is a well-known tortoiseshell. “Snapdragon,” another prize-winner, was exported to America, where quite a number of the Romaldkirk cats have found their home. We need a few more enthusiastic admirers of tortoiseshells like Miss M. Beal to take up this rather despised breed and follow in her footsteps. Some notes by the owner of “Pansy” will be of interest:—

“Even fanciers who will go into raptures over the blue, orange, cream, or silver members of the establishment have no admiration to spare for a tortoiseshell, however striking its record of prizes may be; and yet to those who breed and understand them there is something very fascinating about these quaint creatures, though the taste for them is certainly an acquired one.

“Among non-catty people great ignorance prevails as to what colour a tortoiseshell cat really is. Many people, if asked to describe a tortoiseshell cat, would say that it was a sort of sandy colour all over; others imagine that the ‘chintz’ cat, as it is called in the North—white with black and red patches—has a right to the name. So let it be said at once that three colours, namely, orange, yellow, and black, and these only, enter into the composition of the true tortoiseshell. There must be no white, neither should there be any trace of tabby markings, though this is very difficult to attain. The three colours should be patched or ‘broken’ all over the cat, and the more distinct each separate colour is in these patches the better. Brilliancy of colour is another point which breeders have to consider; many tortoiseshells have far too large a proportion of black in their colouring, which gives them a dingy and uninteresting appearance, and is sure to go against them in the show pen. The eyes should be orange, and in other points, such as shape, head, and texture of coat, the standard is the same as for the other varieties of long-haired cats.

[Illustration:

TORTOISESHELL AND TORTOISESHELL-AND-WHITE PERSIANS.

(_From a Painting by W. Luker, Jun._)]

“One curious fact in connection with long-haired tortoiseshells, which is well known to fanciers, may be mentioned, namely, the non-existence of the male sex. Among short-haired tortoiseshells toms are exceedingly rare, though one or two do exist; but an adult long-haired male appears to be absolutely unheard of. The writer knows of one male kitten born some years ago, but it was either born dead or died in very early infancy. Darwin’s theory that the orange tom and tortoiseshell queen were originally the male and female of the same variety is borne out by the fact that until recently orange females were also rare. Of late years a good many of these have been bred and reared, and therefore, if the Darwinian theory be correct, it seems hard to believe that the tortoiseshell tom must be regarded as unattainable. If the difficulty has been successfully overcome in the one case, why not in the other? Breeding with this object in view is very slow work, for some tortoiseshell queens will produce litter after litter without a single kitten of their own colour, and a family consisting entirely of tortoiseshells would be as welcome as it is rare. But it would be a pity to despair of breeding the long looked for tom; if he ever does make his appearance, he will be hailed with sufficient interest to gratify any quantity of feline vanity.

“At present, breeders hardly seem to recognise the great value of a tortoiseshell queen for breeding almost any variety of self-coloured cat. If the queen is mated to an orange, a cream, or a blue tom, she will be very likely to produce at least one or two really good specimens of the same colour as the sire, and sometimes a far larger proportion of the litter will ‘favour’ him. Much, of course, depends upon how the queen herself is bred, and this no doubt accounts for disappointment in some cases.

“Tortoiseshells compare very favourably with the other varieties of long-haired cats in the matter of intelligence. The writer knows one which enjoys the well-earned reputation of being the cleverest thief in the cattery. Nothing is safe from her nimble paws; she has often been known to remove the lid from the saucepan in which the meat for the cattery supper had been placed, and make off with the contents; and if the cook’s back should be turned for only half a minute, woe to tomorrow’s dinner or to anything else tempting which may chance to be within reach!

“Though tortoiseshells may be distinguished for brains, some of them certainly fail considerably in temper. They seem to find it most difficult to keep the peace with the other members of the cattery. I sincerely hope this breed will receive more attention from

fanciers in the future.

(_Photo: W. V. Amey, Landport._)]

CHAPTER XVIII. TORTOISESHELL-AND-WHITE PERSIANS.

These cats, both long- and short-haired, have always had a great fascination for me. One of my first Persian pets was a tortoiseshell-and-white, with a gorgeous coat, stand-out frill, and wide-spreading tail. She was so stately and dignified that we called her "The Lady Mayoress." In those days cats were of no account, and shows were non-existent. My pretty pet roamed at will and made her own matrimonial arrangements: the kittens were consequently mostly consigned to the bucket.

With my present knowledge of the feline race, I realise that "The Lady Mayoress" was a grand specimen of what a tortoiseshell-and-white should be. She was not a white-and-tortoiseshell, as so many now seen in the show pen might be called. In these cases the white predominates, and in reality the four colours should be about equally distributed. The patches of black, red, and yellow should cover the back, head, and tail, leaving the chest and paws and part of the hind quarters white. There should be patches of the three colours on each side of the face, with a white blaze up the nose.

[Illustration:

"PEGGY PRIMROSE." OWNED BY MISS TERRILL.

(_Photo: W. Baker, Birmingham._)]

As in the tortoiseshells, so in this breed it is better for the brighter colours rather than the black to predominate. I believe an old-fashioned name for this breed was chintz cats. I think they might also be called patchwork cats! There is a great deal in the manner in which the colours are distributed on either side of the head, for expression in a cat goes a long way, and if the patches are badly placed and unevenly distributed the effect may be displeasing, and perhaps grotesque.

Harrison Weir, in writing of this breed, says: "In a good tortoiseshell-and-white there should be more white on the chest, belly, and hind legs than is allowable in the black-and-white cat. This I deem necessary for artistic beauty when the colour is laid on in patches, although it should be even, clear, and distinct in its outline; the larger space of white adds brilliancy to the red, yellow, and black colouring. The face is one of the parts which should have some uniformity of colour, and yet not so, but a mere balancing of colour; that is to say, there should be a relief in black, with the yellow and red on each side, and so in the body and tail. The nose should be white, the eyes orange, and the whole colouring rich and varied, without the least 'tabbiness,' either brown or grey, or an approach to it, such being highly detrimental to its beauty."

This is another of the breeds of long-haired cats that may be said to have no history in the fancy, and I doubt if tortoiseshell-and-whites will ever be taken up seriously. There will always remain the difficulty of obtaining good mates for the queens, as males in this variety are almost as rare as in the tortoiseshells. It would seem that the corresponding males to tortoiseshells and tortoiseshell-and-whites are orange and fawns. I do not remember ever having seen or heard of a long-haired tortoiseshell-and-white tom cat; and as regards notable females, these have never at any time been numerous, and few really good specimens have been exhibited.

[Illustration:

MISS YEOMAN'S TORTOISESHELL-AND-WHITE "MARY II."

(_Photo: D. Pym, Streatham._)]

The most perfect type was Lady Marcus Beresford's "Cora," an imported cat of great size and beautiful shape. Her colouring and markings were lovely, and her round snub face and short nose lent great charm to this unique specimen. It was a grievous loss to her owner and the fancy when poor "Cora" suddenly developed dropsy, and succumbed to this rather unusual complaint amongst cats. Mrs. Davies possessed a fine tortoiseshell-and-white named "Chumly," and Mrs. Bampfylde's "Susan" was a good type. Many of the cats exhibited have either too much or too little white, and often there is a grave suspicion of tabby amongst the black and

orange.

Coming down to the present-day cats, I may mention Mr. Furze's "Beauty of Birmingham" and "Peggy Primrose," both of which he disposed of after shows where they were exhibited. There is no doubt these cats are very taking in the show pen, where darker feline beauties are at a considerable disadvantage.

I have had a difficulty in obtaining any good photographs illustrative of these cats, for, as with tortoiseshells, the colouring cannot be successfully portrayed by any gradations in tone, so that the orange and black both appear dark on a white ground, and thus the individuality of the breed is lost. It is different in painting, when it may be generally noticed that artists choose to depict these broken-coloured cats in preference to the self-coloured ones. In Madame Ronner's lovely pictures, of which several adorn these pages, it will be remarked that almost all the fascinating fluffy kittens are patched in colour.

As I have remarked, one of the reasons why these cats have not been seriously taken up by fanciers is the difficulty experienced in selecting suitable mates that will be likely to perpetuate the breed. In fact, this is not possible with any degree of certainty. Tortoiseshell-and-whites may be crossed with black or orange cats, and it is a toss-up what the progeny may be. Creams are sometimes bred by mating with blues, but there is always the danger of white spots and white toes. I once mated a pretty tortoiseshell-and-white with my silver "Cambyses," and the result was a good pale silver and an almost unmarked cream. Considering all things, I cannot prophesy any future for this breed in the fancy; in fact, I think there is every chance of these really pretty pussies disappearing from our midst. At the Westminster show of 1903 there was only one solitary entry in the tortoiseshell-and-white class! This was Miss Yeoman's "Mary II.," whose portrait appears on the foregoing page.

[Illustration:

MISS SIMPSON'S BROWN TABBY "PERSIMMON."]

CHAPTER XIX. BROWN TABBY PERSIANS.

My first prize-winning kitten was a brown tabby, exhibited many years ago at the Crystal Palace. He became my stud cat "Rajah," called after an Indian prince who was visiting us at that time. "Rajah" was wholly and devotedly attached to the lady of his choice, namely, my blue Persian "Mater." These two names occur in the pedigree of many a prize-winner of the present day, and very numerous were the lovely litters I reared from this eminently respectable pair of Persians. I never knew either "Rajah" or "Mater" troubled with a day's illness, and if one of their kittens had died such an event would have caused as much astonishment as grief. But I must return to my tabbies.

I cannot explain it, but certain it is that of all the feline race (blues not excepted) the warmest corner in my heart has always been kept for the brown tabbies. There is something so comfortable and homely about these dear brownies—they seem to have more intelligent and expressive countenances than any other cats, and I am firmly of opinion that no Persian cats are so healthy and strong as brown tabbies. They are a hardy race, and as such I have frequently recommended novices in the fancy to start with a good brown queen, and with ordinary care they may reasonably expect to rear litter after litter without the difficulties and disasters that one hears of in connection with the bringing up of Persian kittens in general.

I know there is a kind of idea that brown tabbies are a common sort of cat, and this breed is often spoken of in a most disparaging way. Then, again, the ignorant in the cat world have an extraordinary notion that tabbies are always females! Perhaps because we sometimes hear a meddlesome or gossiping woman called a "tabby"—and I had a dear old friend who always bade me beware of "tabby bipeds" among catty communities!

The word "tabby" is supposed to have had its origin in a certain street in Bagdad called "Atab," which was chiefly inhabited by weavers of a particular kind of material called "Atabi." This is what Harrison Weir says on the subject:—"The word 'tabby' was derived from a kind of taffeta, or ribbed silk, which when calendered, or what is now termed 'watered,' is by that process covered with wavy lines. This stuff in bygone times was often called 'tabby,' hence the cat with lines or markings on its fur was called a

tabby cat. Certain it is that the word ‘tabby’ only referred to the marking or stripes, not to the absolute colour, for in ‘Wit and Drollery’ is the following:—

Her petticoat of satin, Her gown of crimson tabby.

Be that as it may, I think there is little doubt that the foregoing was the origin of the term. Yet it was also called the brindled cat, or the tiger cat, and with some the grey cat—‘graymalkin.’” We are told also by the same authority that tabby cats in Norfolk and Suffolk were called cyprus cats, cyprus being a reddish-yellow colour, so that the term may have applied to orange as well as brown tabbies. The term “tiger cat” is, I believe, often used in America, and it well describes the true type of a brown tabby. The ground-work should be of a bright tawny shade, with a dash of burnt sienna, the markings a dark seal brown—almost black. As regards the colour of eyes in brown tabbies, I prefer the golden or orange; but some of the finest cats in this variety have possessed the green eye, and some fanciers are disposed to prefer this colour, which I think should be the speciality of the silvers. Anyhow, a good brilliant green is preferable to a washed-out undecided yellow.

[Illustration:

MISS MELLOR’S BROWN TABBY “LADY SHOLTO.”

(_Photo: N. N. Statham, Matlock Bridge._)]

There are two distinct types of brown tabbies—the splashed or heavily marked, and the barred or ticked. I think the former the handsomer breed, with the well defined and evenly balanced side markings, the dark spine line (not too wide), the clear rings round the chest (commonly called the “Lord Mayor’s chain”), the paws ringed in graduated bars to the foot. On the head and face the markings should be very clear and distinct, the narrow dark head lines running symmetrically till they join the broad spine line. The ruff should be of the light shade, and ears of the same tone lend great distinction to this cat. As in the other tabby breeds, the browns are terribly addicted to white chins; in fact, I think it is certainly rarer to find a brown tabby without this blemish than an orange, more pains having been taken to eradicate the evil in orange tabbies. There is no denying the fact that brown tabbies are a very neglected breed, and at present the only one, except tortoiseshell-and-white, that is not taken up by a specialist society. This is a crying shame, and it remains for some ardent admirer of the dear brown tabbies to form a club, and to try to breed really good specimens of the golden-brown order; not the drab or grey animals that are so frequently seen at our shows, and which are very far removed from the genuine article.

I do not think that any breed can produce such fascinating kittens. They have such remarkably intelligent expressions, and, as a rule, the sturdy cobby shape and broad heads of brown tabbies are very conspicuous. This breed should distinctly be massive in build, with plenty of bone and muscle; in fact, with brown tabbies the larger the better, if well proportioned. With the sterner sex brown tabbies are decided favourites, and I cannot help noticing that the very few fanciers who have taken up this breed amongst the gentler sex are what might be termed strong-minded.

[Illustration:

“CHAMPION CRYSTAL.”

OWNED BY C. H. JONES, PALMYRA, N.Y.]

I have also remarked that when once fanciers start breeding brown tabbies they continue, and this cannot be truly said of other breeds—silvers, for instance; but I would fain see a steady increase to the ranks of breeders of brown tabby Persians, and more encouragement given at shows. I know that as matters now stand fanciers complain they cannot get any market for their tabby kittens, and that classification is poor at shows and prizes scarce. It is all too true, but surely it is a “long lane that has no turning,” and as every dog has its day, so perhaps in the future, whether near or distant, this beautiful breed will gain all the admiration and attention that it deserves. There is a distinct kind of brown tabby, so-called, which may better be described as sable. These cats have not the regular tabby markings, but the two colours are blended one with another, the lighter sable tone predominating. At the Crystal Palace Cat Show of 1902 the class was for brown tabby _or_ sable. I was judging, and, considering the mixed entries, I felt that markings must not be of the first importance, and so awarded first and second to Miss Whitney’s beautiful sable females, the third going to a well-marked though out of condition brown tabby. These sable-marked cats are rare, but still more beautiful would be a cat entirely of the one tawny colour—a self sable, without markings. “The most suitable factors to obtain this colour,” so writes Mrs. Balding, “would probably be tortoiseshell-and-sable tabby, as free from marking and as red in ground colour as possible. A

cross of orange, bright coloured and as nearly as obtainable from unmarked ancestors, would be useful. Some nine years ago I purchased a dimly marked bright sable coloured cat, ‘Molly,’ shown by Mrs. Davies at the Crystal Palace, with a view to producing a self-coloured sable cat; but ‘Molly’ unfortunately died, and I abandoned the idea.” The nearest approach to a self sable I have ever come across was a cat I obtained for the Viscountess Esher, which had, alas! been neutered. He was almost unmarked, and of the colour of Canadian sable, with golden eyes—a most uncommon specimen.

Another species is the spotted tabby, but I have never seen a true specimen in Persians. Some brown tabbies are ticked or spotted on the sides, but they have the spine line and markings on neck, head, and tail.

Very few and far between have been good brown tabbies in the history of the fancy. Amongst the males two names may be said to stand out conspicuously—Miss Southam’s “Birkdale Ruffle” and my own “Persimmon.” Both these cats, of quite different types, have gone to their rest.

As regards the famous Birkdale strain, the following account, kindly supplied to me by Miss Southam, will be of interest:—

“There is no doubt that, until quite recently, our old friend the tabby has been deliberately placed in the background, and regarded in the show world with an indifference which has proved an unmistakable stumbling block to the improvement of this particular breed.

[Illustration:

A ROOM IN BRAYFORT CATTERY.

(_Photo: W. Lawrence, Dublin._)]

“Nor is this very much to be wondered at, when we take into consideration the hideous combination of the drab, colourless browns, dowdy greys, and indistinct markings which had hitherto constituted the chief charms of the typical tabby. Instead, it would appear that the commonplace and unattractive grey was openly encouraged, rather than otherwise; for, although the silver tabby was provided with a classification of his own, only one class was relegated to “brown and grey tabbies,” either colour being considered equally worthy of carrying off premier honours!

“It was at this period, when the nondescript tabby was reigning supreme, that Champion ‘Birkdale Ruffie’ made his _début_ in the show world, my sister, Miss Emily Southam, being the first to bring the sable tabby into prominence. Whether, however, it was that the public was not sufficiently up-to-date to appreciate the sudden departure from the usual sombre colours with which it had hitherto been satisfied to a brilliant sable, or whether he was particularly unfortunate in his choice of judges, it is difficult to say; at any rate, it was not until four years after his first appearance in the show pen that he met with the justice that his many beautiful points so richly deserved. In fact, after exhibiting him at several shows, where he was deliberately passed over for other and most inferior cats, he being in the pink of condition, my sister was so annoyed at the treatment he received that she simply burnt the schedules which poured in upon her and kept him at home, determined he should not be further insulted by such flagrant injustice!

“It was at the West of England Cat Show in 1894 that ‘Birkdale Ruffie’ scored his first real success—I believe under Mr. Gresham—winning two first prizes in the open and novice classes and two specials. Here at last his beautiful sable colouring, his dense black markings, and wonderfully expressive face were appreciated.

“The year 1896 was the occasion of his sensational win at the Crystal Palace show. He simply swept the board, carrying everything before him—first prize, championship, several specials, and the special given by the King (then Prince of Wales)—for the best rough-coated cat in the show, the prize being a handsomely framed portrait of the King with his autograph attached. Mrs. Vallance was judge. Again, in 1897, he was shown with great success at the Crystal Palace, winning first prize, championship, and special.

[Illustration:

MISS WHITNEY AND HER NEUTER BROWN TABBY.

(_Photo: W. Lawrence, Dublin._)]

“This was the occasion of ‘Birkdale Ruffie’s’ last appearance before the public, as it was during the following month my sister was taken dangerously ill, and for this reason his pen at the Brighton show was empty. After her death we determined to subject him no more to the trials and discomforts of the show pen, so ‘Ruffie,’ who was now seven years old and a great pet, both for his own sake

and that of his mistress, only too gladly retired into the privacy of home life, spending the cold winters by the fireside in his own little snug retreat, and in the long summer days lying under his bower of shady hops, lazily watching his facsimile, his little son ‘Master Ruffie,’ growing up more beautiful each day and ready to take up the thread of his father’s famous career in the exhibition world.

“Into the latter ‘Master Ruffie’ made his _début_ without any of the numerous anxieties encountered by his celebrated parent. The way was paved for him, and when he appeared at the Crystal Palace show in 1899, in all the full glory of his youth and beauty, it was difficult for the judges to realise that it was not their old favourite who was now confronting them through the wires!

“‘Master Ruffie’ has only been shown on two occasions—in 1897 as a kitten, and in 1899 at the Crystal Palace, when he returned home with his box literally filled with cards, his winnings including three first prizes, four specials, and a championship.

“I am sorry we can manage to get no really good photo of ‘Master Ruffie.’ Time after time we have attempted it—in studios, out of doors, by means of professionals and amateurs—including many kind relatives and friends with their ever-ready little Kodaks! ‘Master Ruffie’ steadfastly refuses to face the camera. Again and again the button is pressed in vain, and only the glimpse of a vanishing tail upon the negative is all we have to show as ‘Ruffie’s’ portrait!

“But we have only to look at ‘Birkdale Ruffie’s’ picture, and we have ‘Master Ruffie’ too! The only difference between them is that the latter is a very cobby little fellow, being perhaps shorter in the legs, which makes him appear to be a somewhat smaller cat than his father. In fact, at the Crystal Palace show he was pronounced by the judges to be perfect in every point.

“‘Birkdale Ruffie’ was noted for the extreme beauty of his expression; he had certainly one of the most characteristic faces ever seen in a cat, and his son inherits the same. The former was constantly the subject of sketches in the illustrated papers, those by Mr. Louis Wain being especially lifelike.

“Some of ‘Master Ruffie’s’ descendants are, I believe, in the possession of Miss Witney, and have met with great success in the show pen.

“Our cattery is built on the principle of shepherds’ huts, each house having a separate wire run, with shrubs planted, and a thick wall of ivy in the background, which gives a picturesque appearance to the whole of the little colony. In summer a mass of luxuriant hops makes a welcome shade from the hot sun.

“The houses are warmed by gas stoves, on which the cats love to sit, purring contentedly, and with the pretty curtained windows, carpets, wickerwork armchairs, and cosily cushioned benches, I think ‘Master Ruffie’ and his seven feline playmates have a pretty easy time in this tempestuous world!

[Illustration:

“BRAYFORT FINA.”

MISS WHITNEY’S “BRAYFORT PRINCESS.”

(_Photos: W. Lawrence, Dublin._)]

“The one bone of contention is that the cats have appropriated the sunniest corner of the garden, their houses having the much desired southern aspect, which our gardener looks at with longing eyes for his beloved peaches and early peas. Happily, he bears the little occupants no grudge, and when we go from home takes over the whole of the cattery into his charge.”

Here let me give a few details of my dear departed puss. “Persimmon” was a well-known character in the fancy, and had the distinction of being a champion in the National Cat Club and the Cat Club. It was in 1899 when, judging at Brighton, I was greatly taken with a wonderful-headed brown tabby that came under my awards. I gave him first in his class, and when later I obtained a catalogue and saw his price was a very reasonable one, I purchased him, and I may say I never made a better bargain, in or out of the cat fancy. “Persimmon” (as I afterwards called him, in memory of the Derby winner) was bred by Mr. Heslop, of Darlington, that astute and clever cat fancier; and his grandsire was “Brown Prince,” a noted Northern prize-winning tabby. I have never seen such a wonderful head as that which made “Persimmon’s” chief glory.

[Illustration:

“LONSDALE CHRYSALIS” AND “LONSDALE MOTH.”

BRED BY MRS. GREGORY.

(_Photo: W. G. Lewis, Bath._)]

His face was very round, and his nose quite a snub, and he was blessed with tiny ears and short tail. His shape was perfect, but the markings on his back were rather too heavy, and alas! he had a white under-lip. But, taking him all round, he was a grand specimen, and a most lovable puss. He fretted himself to death when a change of residence from the country to London obliged me to board him out.

“Persimmon” sired some splendid kittens, which whenever shown proved themselves worthy of their sire’s long prize-winning record. At the Crystal Palace show of 1902 Miss Whitney exhibited two of his progeny—a superb neuter “Persimmon Laddie,” who covered himself with glory and his cage with cards, and a beautiful kitten that had previously won at Manchester and has since been purchased at a high figure by a lover of the brownies. At the Specialist Show at Bath in January, 1903, “Persimmon Laddie” was again to the fore, and won in the open and ring classes. “Persimmon” was a great loss, for good brown tabbies are rare. I hope, however, to purchase a fine, well-grown son of my dear old “Simmy,” and as “Persimmon II.” I trust it may be a case of “like father like son,” and that by-and-by we may find quite a long list of brown tabby Persians “at stud” in the columns of the catty papers.

I think I may with truth assert that brown tabbies are more appreciated, and that better specimens are produced in the North than in the South of England. I have mentioned Mr. Heslop as having owned some splendid specimens, and at one time he used to exhibit quite a number at our Southern shows. Miss Eggett, of Manchester, has a grand tabby of the golden order named “Cleopatra.” Mrs. Whittaker has some nice specimens, and Mrs. Mackenzie’s “Cleo” was much admired at the Westminster show in 1900, when she took first in her class. Mrs. Ricketts has always been partial to the breed, and Mrs. Stead’s “Timber” has done some winning. Miss Gray’s “Lady Babbie” was one of the finest brown queens that used to visit “Persimmon,” and another was Miss Meeson’s “Jolie,” whom I used greatly to admire. Miss Derby Hyde exhibits a wonderful copper-coloured brown tabby called “Maraquetta,” who, if only possessed of a good head and shorter face, would be a splendid specimen. Mrs. Davies formerly owned “Susan,” a cat now in the possession of Mrs. G. Wilson, very good in colour and markings, but failing in head and face. Mr. Western, of Sandy, has a good male in “Wynstay Monarch.” In the West of England Mrs. Hellings and Mrs. Gregory are admirers and breeders of brown tabbies.

[Illustration:

MRS. D’ARCY HILDYARD’S “SULPHURLAND.”

(_Photo: Boxell & Co., Scarboro’._)]

Mrs. Gregory, of Bath, started breeding brown tabbies in 1899. Her female (a black) she mated to her stud cat “Azor,” and, curiously enough, all the litters have consisted of brown tabbies, the kittens numbering sixteen in all. When, however, “Queen Caterpillar” was mated to Mrs. Gregory’s blue Persian, her kittens were all black.

A picture of two pretty brown tabby kittens bred by Mrs. Gregory appears in this chapter. I am happy to say that Mrs. Gregory intends to continue breeding brown tabbies, and has kept a handsome specimen from one of her recent litters to perpetuate the strain. Mrs. Drury, of Graffham, is very faithful to the brownies, and in her lovely old-fashioned cottage near Petworth she is always surrounded by several of her pet pussies. She writes as follows:—

“When first I received a margarine basket, and out of it came a little brown fluffy kitten, I knew no more about Persian cats than the man in the moon—in fact, he probably knew more, as he is frequently the only witness to their nocturnal gambols. I had heard of such things as Persian cats, yet never remember having seen one. However, kind friends soon gave me a helping hand, and as time went on and my fluffy kitten became a fluffy cat, being passionately fond of animals, I soon found out the very fascinating ways of dear ‘Miss Wiggs,’ so named because the fur on her head in her kitten days would stand erect, and it is the only name she condescended to answer to. She has been—and is so still, in spite of all her maternal cares and five years’ experience—one of the healthiest pussies imaginable, and has never had one day’s illness since she came into my possession, though I believe, in her babyhood, distemper nearly carried her off; and all her children have been equally healthy—in fact, I have never lost one of her kittens, which is, I imagine, almost a unique experience.

“‘Miss Wiggs’ came from a blue father and a silver mother, but has, with one exception, always had brown babies, even when mated to a silver. The varied beauties of blues, silvers, whites, and blacks have never taken such a hold upon me as compared with the fascination of the browns, and it is quite a wonder to me more fanciers do not breed them. Nothing looks handsomer, to my mind, than a rich brown, tabby male with tawny markings, like a young lion, and judging from my experience they amply repay any trouble taken by their loving ways and robust health. I have a son of ‘Miss Wiggs’ and poor old ‘Persimmon’ now, who follows me like a little dog, even out in the road, and goes for a walk running by my side.

“Perhaps what would astonish a stranger most on coming to see me is the way my catty family lives in peace and contentment with the dogs, and very often I find two or three kittens in the dogs’ basket very busily occupied cleaning my little bull-terrier. It is a point of honour amongst the happy family that they never touch each other’s food, and very rarely is this broken, and not infrequently we see three, and perhaps four, cats sitting round the dog while he eats his dinner, waiting for any leavings, and the same with the dog. Persians have the reputation of being bad mousers. ‘Miss Wiggs’ makes quite the exception, and on one occasion caught and killed two mice at the same time; one she held in her paws and the other in her mouth. Young rats also she has many times brought in, to show what a useful little person she is, and her children follow in her footsteps.

“In a great measure I attribute my brownies’ good health to the open-air life they lead. From early morning to when darkness approaches they have the run of a large garden, even on a wet day. They go in and out of the houses as they like; never sleep indoors, always in a very dry little outside cattery—in summer on benches, and in winter in nice boxes with straw.

“Perhaps, financially, blues or silvers may be greater successes, but brownies have been my first love and will always remain so. I am only sorry I cannot show what a lovely head and sweet face dear ‘Miss Wiggs’ has, but she absolutely declines to be photographed.

“In time I hope more fanciers may realise how rich in colour and markings a good brown tabby is, and then we may hope to see this beautiful breed brought more to the fore at all the leading shows.

“As ‘Miss Wiggs’ has been the foundress of my cattery, perhaps a short description of her would not be amiss. She is a ticked tabby—that is to say, she has not the broad, dark stripes with tawny splashes; her ground colour is a beautiful golden brown, and down the back and sides are pencilled stripes, more like the markings on a silver. Round her face, nose, and ears she has most lovely golden brown shades; eyes are green—they used to be amber; her head is very broad and well shaped; and her expression is very sweet.

[Illustration:

“PIONEER BOBS.”

OWNED BY MISS M. WASHBURN, SMITH’S FALLS, ONT.

(_Photo: E. F. Briggs, Smith’s Falls, Ont._)]

“When mated to a silver, as she has been twice, the litters have been equally divided—two silvers and two brownies; but both silvers and browns in that case had broad dark and light markings, in no way resembling the ticking of the mother. But when mated to poor old ‘Persimmon’ the kittens have been equally divided, always two resembling the maternal side exactly, and two following out ‘Persimmon’s’ beautiful splashes. When mated to a brown tabby all the kittens were brown. She has never thrown a black; but her daughter, whose father was ‘Abdul Zaphir,’ and who I also mated to ‘Persimmon,’ had two blacks and two very dark tabbies in her litter. ‘Wiggs’ has in all her five litters had only two females. Her average is four or five kittens; she looks after them entirely herself, and has never been the worse for so doing; but I do not allow her more than one family a year, and until the kittens can lap she is fed every two hours.”

The best-marked brown tabby I have ever seen was Lady Marcus Beresford’s’ “Bassorah,” who was unfortunately given away and lost. Her markings looked like oil painting, they stood out in such distinct relief. Another specimen of a different type was imported by Lady Marcus Beresford, namely “Kismet.” She was of the ticked order, with small pencilled markings, very compact and cobby in shape. Mrs. Herring has always possessed good brown tabbies. To begin with, “Adolphe,” who used formerly to win everything till his son, “Prince Tawny Boy,” stepped into his shoes, to be displaced later by his own son, “Prince Adolphe,” and his exquisite daughter, “Floriana,” now in America. Another good son of “Adolphe’s” was Mrs. Bonar’s “Lord Salisbury.” To go back as far as I can recollect, there was Mr. Horrel’s “Nero,” and Mrs. Pearce’s “Juliet” and “Rosebud,” also Miss Malony’s “Lindfields Lion” and the

Hon. Mrs. McLaren Morrison's "Cetewayo" and "Mazawattee," this latter a really wonderful cat which was imported by Mrs. Davies at the same time as the celebrated "Nizam," and reported to be his brother. Anyway, he resembled him greatly in everything but colour.

For sables we, of course, go to the Birkdale strain. I remember the incomparable "Birkdale Ruffie" in his full glory at the Crystal Palace—a mass of red-brown fur, of the style of "Persimmon Laddie," but with more distinct markings and a very keen, almost fierce, expression; in fact, he looked like a wild animal!

Then "Master Ruffie" appeared as a kitten, and later as a mild edition of his sire. From this celebrated strain Miss Whitney's lovely sables are descended. This enthusiastic fancier has kindly written some notes on her favourite breed. Her cats are all pets, and lead a life of luxury in their town and country houses on the other side of the Irish Channel. Miss Whitney says:—

"I am pleased to see that brown tabbies are coming to the front again, after being such a long time in the background. It now rests with fanciers of this charming variety of the feline species to improve them in all points. We hear often that they should be a rich tan in ground colour, clear and dense in markings, profuse in coat, ruff and frill, large round head, small ears, and no white lip. I should consider this a perfect specimen; but where is such to be had? I do not say it will not be obtained, but up to this I have never seen it. Now what we are to endeavour is to breed up to this high standard. This will take time, no doubt; but, above all, do not let us give up everything for markings, though they are very essential.

"My idea of a brown tabby is that it must be of a rich tawny ground colour. How could a brown tabby be called a brown if it is only a greyish drab? I should prefer to do without such perfect markings, but to have the more desirable rich colour, and, above all, plenty of coat, ruff, and frill; if it has not these latter qualities, it could not be called a Persian, which must have an abundance of fine soft-textured coat. If we only breed for marking, why not mate to a 'short-hair,' which is more likely to be perfect in that point? But then, where would be our true Persian? Now, as to white lip, I have never seen a good brown tabby without it, but I hear that there are such, though they fail in colour. I would prefer the well-coated cat with good colour and markings and a white lip to one that failed in these other points and had no white lip (I do not mean when it extends to a white throat). Now if we happen to breed a good kitten without a white lip, and should strive to mate her to a really well-marked stud cat, even should he fail in colour—perhaps we might get even one kitten nearly reaching perfection as the result. It would reward the patience, expense, and time; but we need never expect a profusely coated cat to show as distinct markings as an inferiorly coated one will. I breed nothing but brown tabbies, but cannot say I have yet obtained perfection. I have, however, secured coat and colour, and expect to attain the other desirable points in the near future, as we must all persevere, but always let us breed up to the standard of the true Persian.

[Illustration:

"LORNA DOONE."

BRED BY MRS. ELLIS, TORONTO.]

"I first became interested in cats by being given a nice brown tabby Persian kitten, which I called 'Ruffle,' and got very fond of him; but as he seemed lonely I thought of getting another kitten as a companion for him, so I then purchased a pretty little silver tabby from Miss Cochran; but after some time, of all the varieties I saw, none pleased me so well as the brown tabbies. This breed I have gone in for altogether during the past few years, and I feel sure I shall remain faithful to them to the end of my career as a cat fancier. At present I have not a cat of any other colour in my cattery.

"I still have 'Ruffle,' who is now a very large neuter, splendidly marked, but perhaps not quite up to the standard in other points for the English show bench. 'Brayfort Fina' is, I may say, a sable tabby, being particularly rich in colour all throughout—indeed, more often of an auburn tan than brown. She is very profuse in coat, carrying a long body-coat and a big ruff and frill. She is a very large cat, with plenty of bone, and well made, with a fine-shaped head. She was once mistaken for a male by a well-known judge. 'Fina' was bred by Miss G. Southam, and is by 'Master Ruffie' _ex_ 'Bluette,' her sire being a son of the famous 'Champion Birkdale Ruffie.'

"She was already a winner when I purchased her, and has since won many times, including second and special at Bristol, 1899, in a mixed sex class, being beaten by a male. At Belfast, in 1900—the following year—she was beaten out of first by her sister, 'Brayfort Princess.' She then took second at Westminster, 1902; first at Reading, and first and championship at the Crystal Palace, 1901 and 1902. Again first at the Bath Specialist Show in the same year, where her gorgeous colouring was called in question and an unsupported protest was made that she was dyed! She is a most successful breeding cat, her produce being usually winners.

Her sister, ‘Brayfort Princess,’ is also a sable tabby, and carries an immense coat, ruff, and frill; it is denser than ‘Fina’s,’ and I fancy but for the latter ‘Princess’ would have been more heard of as a winner, as, except on one or two occasions, she has been usually beaten by ‘Fina.’

[Illustration:

“BIRKDALE RUFFIE.”

(_Photo: J. A. Kay, Southport._)]

“‘Brayfort Persimmon Laddie’ is by ‘Champion Persimmon’ _ex_ ‘Brayfort Fina.’ He made his public appearance at Bristol when he was four months old, taking first and special in a tabby kitten class and third in novice, against an entry of twenty-five adults; then he won first and special in kittens, and second in open to his mother’s first at Belfast in 1900; also he took first and special for best long-haired neuter at Manchester in 1901; first, Liverpool; and first and two specials at the Crystal Palace, 1902. He is too well known to comment on. He is a wonderful sable colour, and is superb in coat. ‘Brayfort Sable Boy’ is also by the late ‘Champion Persimmon’ _ex_ ‘Fina.’ He won first and special at the kitten show in October, 1902, and first and two specials at the Crystal Palace show, 1902; his wins speak to his merit.

“I find all my cats very strong and healthy, and even in the coldest winter they never have artificial heat. I attribute having never lost a pet after a show to taking them away at night. Unless something very unforeseen occurred, nothing would induce me to leave a cat of mine in a show.

“I have found mating to a good brown tabby much the most successful. I tried mating to an orange, but did not like the results. I always mated to the late ‘Champion Persimmon,’ and had never fewer than six kittens in a litter—sometimes eight—all strong and healthy. Twice only have I lost any, and on these occasions the fault lay with the foster mothers.

“In the spring and summer my cats get a run out in the garden every day; the two neuters go on leads, but the females have their liberty; indeed, unless I were present ‘Fina’ would not leave the house. Their rooms look out on the grass terrace, so they can come in or out as they please till their breakfast time, which is at about ten o’clock. They are groomed every morning between 8 and 8.30 o’clock, winter and summer, and always fed regularly. Their sleeping houses, as in photo, are about four feet long, lined round with oilcloth, so they can be washed when necessary. In the winter the bedding is hay, and in summer, shavings. The houses are sufficiently long to allow for sanitary boxes during the breeding time. I find Hall’s washable distemper very nice for the cattery walls, and it looks so bright and fresh. The floor-covering is linoleum.”

In America brown tabbies are beginning to find favour, and several good specimens have been exported. “Arlington Hercules,” who took first at Westminster in 1901, was shipped to Mrs. Sarmiento and Mrs. Cutler, and I sent a “Persimmon” kitten out by Mrs. Robert Locke to Mrs. Clinton Locke, the president of the Beresford Club. He was passed on to her honorary secretary, and in _Field and Fancy_ of December, 1902, the following notice appears:—“Miss Lucy Johnstone is the fortunate owner of ‘Persimmon Squirrel,’ a son of the noted brown tabby ‘Persimmon,’ who lately died. Good brown tabbies are very scarce, and she should congratulate herself on this possession, as, according to all accounts, he is destined to make a good hit.”

Another American lady, Mrs. Gotwalts, of Pittsburg, wrote to me for a brownie, and I sent her one bred by Mrs. Bignell, and the cat has, I believe, had some good litters. The most famous brown tabby, however, over the herring pond was Mr. E. N. Barker’s wonderful “King Humbert.” This cat arrived in America in 1885, and made a considerable stir in catty circles. Mr. Barker is said to have refused a thousand dollars for him from a New York millionaire. I remember when Mr. Barker was over, acting as judge at the Westminster Cat show, he sought, but did not find anything to beat his noted brown tabby now gone to its last home. Mr. Barker, writing of this breed, says:—

[Illustration:

“BIRKDALE RUFFIE’S” CATTERY.]

“If I were asked suddenly why I admire brown tabby Persians, the liking must be partly attributed to face markings and colour, and to one who grows accustomed to these they are fascinating and add to the general beauty of the cat, and seem natural and as though they ought to be there, and one is not so overweighted with a sense of continual sameness as may be apparent in a whole colour. I must confess, personally speaking, I have become used to bars and stripes. I miss them when I contemplate a self-coloured Persian.

“I once had a good many brown tabby Persians, and people did not fancy them, as they said, ‘They are so like ordinary cats’—a great mistake; but by gentle persuasion I managed to get one or two adopted. One lady some time afterwards candidly confessed, ‘I could not now be satisfied with any other kind, I should miss the stripes so much on the face.’ That is just it; in a tabby you have a little more than your neighbours, who go in for self-coloured cats, and, though for the time being they are not quite so fashionable, you can chuckle to yourself if you own one, and feel quietly superior to fashion and the common herd, and hold your tabby still closer to your heart, and purr softly to yourself with satisfaction at its possession; for I think one may say that for good all-round, everyday, reliable qualities, the brown tabby stands pre-eminent.

“His constitution being good, he is not peevish; he stands cold and heat, change of climate and surroundings, better on an average than any. Brown tabbies should have the under-coat a good golden hue, the markings black, clear, and distinct, rather too many than too few. A good-shaped body, lots of bone, a bold head, red nose, golden eyes, well marked on the chest, and no light colour on the lips and chin. These cats may with advantage be a good size. With care, the under colour may be bred to a grand copper colour; a grey hue in brown tabbies is most undesirable.”

“As regards brown tabbies in America, “King Humbert” and his children have always held their own. “Humbert” was bred in England, and as he is now dead I may be allowed to say that when fit and in good condition a better-coloured and smarter show cat never stood in a pen or outside, and he loved to show himself off. The best kitten bred from him was “Jasper.” He was very short in leg, and quite lost in coat, his feet being hardly visible.”

To the readers of that very excellent American publication _The Cat Journal_ the handsome portrait of “Crystal,” the brown tabby, is very familiar. The editor, Mr. C. H. Jones, writes thus to me:—“I am sending you some pictures as promised. The large photo is ‘Champion Crystal,’ son of ‘Humbert,’ a beautiful cat as to type and disposition. A peculiar thing about ‘Crystal’s’ kittens is that they do not show very long-hair till they are several months old.”

And now a few remarks as regards the mating of brown tabbies. I have tried several experiments, but if I were wishing to breed fine specimens I should continue to mate brown tabbies with brown tabbies. Such mating frequently results in a black or two, and these are generally good ones. The orange cross is sometimes successful in introducing a brighter tone, but I confess I have not had very good results from these attempts. I have on several occasions mated blues to my brown tabby stud, and although blue tabbies have appeared in the litters, I have also obtained blues with very grand heads, plenty of bone, and massive build. My famous “Beauty Boy,” a well-known winner and sire of bygone days, was bred from “Rajah” (a brown) and “Mater” (a blue). I have been told by silver breeders that a brown tabby cross with chinchillas has often proved advantageous. It might be imagined that the silvers would be tinged with brown or streaked, but I have been assured this is by no means usual, and that the litters consist of good brown tabbies and equally pure silvers.

A well-known breeder of silvers says:—“Although it may be incorrect to cross silvers and browns, it is often most successful. My first tom was a brown tabby with a white chin, and being mated with a silver queen the kittens were good browns and exquisite silvers, and there were lots of winners amongst them. Many of the silvers were very pure in colour, with lovely markings. My old ‘Climax,’ whose pedigree was pure silver (‘Topso’ and ‘Lady Pink’), was the sire of the noted brown tabby ‘Birkdale Ruffie.’”

Before closing my article, I would remark that the brown tabby and sable, though often classed together, must not be confounded. The brown tabby is supposed to be the common ancestor of all our cats, and hence the tendency to revert to that colour, as in the case of the blue Rock pigeon. This being the case, surely we should have brown tabby cats more nearly approaching perfection than any other colour. They appear in very unexpected places—in a litter of chinchillas or blacks, or among our oranges, and sometimes where no brown ancestor can be traced. In the brown tabby there seems to be little or no inclination to lose the markings, as in other tabbies; rather the contrary, for they overdo themselves sometimes, and form into solid black patches, thus causing the dark saddle, which is a serious fault in this breed. Query: Would generations of in-breeding produce a self brown, as with oranges and chinchillas? I rather doubt it, as I think the common ancestor would, so to speak, “chip in” and assert himself.

As regards the sables, I may remark that they are late in maturing and do not acquire their marvellous colouring till about the second year. Anyway, they rarely make a sensation on their first appearance. As I write I am thinking of “Persimmon Laddie,” who seems to have developed his glorious copper coat in the course of a year, and when seen at the Crystal Palace show of 1902 was as near perfection in the matter of colouring as could be desired. I hope that in time this breed of Persians may find more admirers, and that with patience and perseverance a really good strain of grand-coloured, dark-chinned, and above all splendidly marked brown tabby cats may be seen at our shows.

In America, as will be seen from the following extract from _Field and Fancy_, the brownies are making good headway:—

[Illustration:

BROWN TABBY “GOOZIE.”]

BROWN TABBIES IN AMERICA.

The brown tabby cat, whose fate seemed to hang in the balance for some time, is now, in America, on the road to social prominence, and daily we hear of the progress of the breed, so that the classes next winter seem to promise greater results than ever. From all over we hear of brown tabbies being bred and reared, and, what is more, finding homes at remunerative prices. In looking at the reasons for the popularity of the browns we do not have far to seek, for when once well tried, these cats wheedle their way into your affections by the strength and vitality they display, as a rule; and the general average being level in their temper, with plenty of common sense, as well as bold, lovable cats, are very satisfactory to deal with. Besides these attributes, when bred properly, their colour is most fascinating, and has a faculty of growing upon one, and weaker colours seem tame by comparison.

So far as we can say, that as regards the brown tabbies, the whites and orange, there have been more concentrated efforts to breed good ones by design than in any of the colours, though the silver breeders are now coming up.

Taking a general look at our cats of this colour, we have little to be ashamed of, and the stock is good enough to make the nucleus of a fine lot of show cats, for they inherit their goodness from several generations of the colour, which is much to the point.

Our breeders will find that to breed good tabbies they will have to keep to blood lines, select the best-marked ones, and not switch about in search of all sorts of blood crosses; for the way to breed tabbies is to keep to the colour and get the marks, which too many crosses with solid-coloured cats are liable to spoil. After a time the purely bred and carefully bred strains will stand out and perpetuate themselves, and the chance-breds will go to the wall.

It has been surmised that the reason why the browns are so hardy is that possibly they more nearly approach the natural colour of cats in a wild state, and are perhaps not quite so artificial; but the number that will be bred of superlative colouring to fill the standard from a show point of view will never be too numerous to command high prices, and the greater the competition the greater the value of the variety, as we see in our dogs. For it is in the popular breeds that the prices rule the highest, and the scarce ones seldom realise the same figures, because there is not the same keen competition to get the best.

When we look back we can call to mind quite a few good brown tabbies in the last seven years, and not very many bad ones, and for uniform quality our browns have been the equal of any colour.

Breeders should be careful to select those with the brown or red body colour, and with the stripes as distinct as possible. In our own experience with the colour we have found three varieties, and these are best described as they appear at birth. No. 1 is the cat with a narrow band down the centre of the back, and thin, narrow lines radiating therefrom. These marks may be very distinct when the cat is young, but are not strong enough for a long-haired cat, and the marks are lost when the coat grows. Though these cats are not the best of exhibition cats, they are very useful to breed to those too heavily marked. No. 2 is the cat that is heavily marked and carries too much black, and is often too grey in his body colour, but these, by being carefully bred to other colours, may throw the desired cat; or No. 3, the cat with the orange body colour and the distinct black marks covering about a third of the surface of the cat. This latter we hope to see in greater numbers now that an organised effort is being made to breed the colour true.

A great many of our browns are clear of one great fault, which is the light chin and throat, and it is to be hoped that this will be continued.

Another fault that wants improving, and which is the prevailing fault in one of our prominent strains, is a rather sour green eye, and this has been the cause of some of them having to take a back seat on occasions. Last year was fortunately a great educator for some of our best breeders, and they are now experimenting along the right lines, and are aware, when they lose, why it is so. As the years roll on those who do learn will not expect to win over better cats just because they think they ought.

(_Photo: E. Landor, Ealing._)]

CHAPTER XX. “ANY OTHER COLOUR” PERSIANS.

In the early days of the fancy all sorts and conditions of cats were entered in this class. Blacks, whites, and tabbies were considered important enough to have classes assigned to them; then the rest were all huddled and muddled together in the “any other variety” class. Even in these days it is no easy matter to place the awards in a mixed class; but formerly the judge must have felt puzzled over the prizes, and probably finally gave the highest awards to the breed of cat which he most admired. I do not mean anything personal; but, as I write, I recollect a very large class in 1887 at the Crystal Palace, two years before a class for blues was instituted. Mr. A. A. Clarke was judging, and a female blue, “Fanny,” which I had given to Mrs. W. M. Hunt as a birthday present, was awarded first. She was a beautiful specimen, and but for her green eyes would have been a remarkable cat even in these up-to-date days of the fancy. Whereas, therefore, for many years this “any other variety” class was the largest in the show, it has gradually become beautifully less—and rightly so, for by degrees the various breeds have been improved, and the number of specimens have increased, and the executives of shows have gone with the times and provided separate classes for each breed as occasion seemed to arise. So orange and cream cats are no longer relegated to what we now call the “any other colour” class, and tortoiseshells and tortoiseshell-and-whites are separately dealt with; therefore it is only tabby-and-whites, nondescript smokes, blue tabbies, and black-and-whites that are received into the fold of the somewhat despised “any other colour” class. Blues and blacks with white spots used to be entered in this class, but of recent years both cat clubs have wisely decided that such cats must be entered in their own classes, for a blue is a blue and a black a black, and having a blemish does not alter their breed, but takes so many points away from them; and, of course, their chances of success even with every other quality is small indeed when in competition with pure self-coloured cats.

[Illustration:

A GROTESQUELY MARKED KITTEN.

(_Photo: E. Landor, Ealing._)]

I am of opinion that ere long the “any other colour” class, at least at our principal shows, will cease to exist, and mismarked cats, white-spotted cats, and doubtful smokes will no longer be considered worth entering, and fanciers owning such specimens will make up their minds to keep their pets at home.

For instance, Mrs. Boutcher, a silver breeder, owned a magnificent cat, a son of “Lord Argent.” He was a superbly shaped and grandly coated animal, and was neither a silver nor a smoke—in fact, what might be termed a silver smoke. His face was dark, and tail and paws, and his body was a pale silver grey, shaded to almost white at the roots. His owner entered him in the “any other colour” class one year, and he was disqualified by the judge; then he was next located in the smoke class, but as a different judge was making the awards he was again marked “wrong class.” This noble “Lord Sylvester” was the cause of much correspondence in the cat papers, and discussion ran high as to what manner of cat he was. One of our ablest judges—now, alas! no longer in our midst—wrote thus in _Our Cats_ of December, 1900:—

SIR,—In your issue of the 24th I notice at the meeting of the Silver Society Mr. Boutcher asked the opinion _re_ the decision of myself at the Palace as against that of Mr. House at Brighton. In defence of my own award, I unhesitatingly say that, in the same classification as at the Palace, “Lord Sylvester’s” class was the A.O.C., in which I fearlessly awarded him first prize. Of course, Mr. House has just as much right to his opinion as I have to mine; but, whether right or wrong, _I do know “Lord Sylvester” is not a smoke_, both on my own knowledge of colour and of that set forth in the standards.—I am, yours truly,

E. WELBURN.

Surely this is the common-sense view to take. A year later “Lord Sylvester” was purchased by Mrs. Champion, and travelled out with her to America, where, no doubt, this splendid animal receives all the admiration he deserves, in whatever class he is entered

on the other side of the herring pond.

Since writing these lines I have read an article in _Field and Fancy_ on the New York Cat Show of January, 1903, and the following mention is made: “In the ‘any other colour’ ‘Lord Sylvester’ was to the front, looking splendid.”

As regards the advisability of doing away with the “any other colour” class, I will quote from a letter written by that well-known fancier Mr. W. R. Hawkins:—“Why should one class in a show be given up to the bad specimens or mismarked cats of each colour? Surely the intended use of the ‘any other colour’ class was that when any definite colour had no class of its own it should not be excluded from the show, but take refuge in the ‘any other colour’ class; for instance, at the Brighton show (1900) we had no class for cream, orange, or tortoiseshell. They were, therefore, shown in the ‘any other colour’ class, and being good cats of definite breeds were a credit to the class, and in no way a disgrace. But what do we often see? A blue with a white spot or some other freak winning. I say this is absolutely wrong, and that a blue with a white spot is in reality a bad blue, and should not be encouraged. In the same way, a tabby-and-white is a bad tabby, and ought not to go to a show at all, but even if shown has no right in the ‘any other colour’ class, according to my ideas.”

There is one cat that is fast vanishing from our midst. I mean the black-and-white Persian, and yet I confess an evenly marked specimen is a handsome animal. By black and white I mean the ground should be black, dense and glossy; the feet, chest, and nose white, with a blaze of white coming to a point up the centre of the face. The eyes of such a cat should be orange.

Another type is the white and black cat, but unless the black patches are evenly balanced, especially in the face, the effect is not pleasing (see illustration, page 232). Harrison Weir gives particulars of some curiously marked cats coming under his notice—“one entirely white with black ears; another white with a black tail only; another had the two front feet black, all else being white.”

I cannot say I have any leaning towards tabby-and-white cats, or orange-and-white, these being the least attractive of any in the fancy. Blue-and-whites are seldom seen, but the photos on pp. 234–5 represent some sweetly pretty kittens of this variety. Their sire was “Yani,” a noted blue owned by Miss E. Goddard, and their mother a black-and-white. Blue tabbies, so common fifteen or twenty years ago, are no longer to be seen, at least only here and there at shows, and they have really no value beyond being pretty pets. A cat that has done some winning and has sired some lovely kittens, but must, strictly speaking, be considered an “any other colour” cat, is “Blue Robin,” formerly the property of Miss H. Cochran, and now in the possession of Mr. C. W. Witt. This is a blue cat with a tabby-marked head. He was bred from blues and silvers, and his chin, ear tufts, and eyebrows are silver, and his nose pink. As will be seen from his picture, on page 236, he has a grand head and beautiful expression. I am indebted to Miss Hester Cochran for the following notes on “any other coloured” cats:—

“The cats known as ‘A.O.C.’s’ or ‘any other colour,’ because they are of a colour for which no class is provided, are hard to write about, because they have no history. They are not bred from A.O.C.’s, and A.O.C.’s are not bred from them. They are either pedigreeless or, more commonly, the result of indiscreet crossing of two definite colours, as, for example, when the owner of a white queen wishes to breed a litter of blue kittens. More rarely they result from a cross which has been resorted to to fix some special point, as when a white and a blue with particularly massive heads or wonderful orange eyes have been mated with a view to producing a strain noted for their eyes. Years ago the classes were interesting, as they introduced all new colours.

[Illustration:

“LOCKHAVEN COLBURN.”

A GOOD EXAMPLE OF PERFECT BLACK-AND-WHITE MARKINGS. (_Photo: Koehne & Bretzman, Chicago._)]

“I remember an A.O.C. class at the Crystal Palace not many years ago containing seven entries, all good smokes; soon after smoke classes were given, and then chinchillas began to appear in this class. These cats being specially provided for, creams were the most noticeable A.O.C.’s; but now the blue tabbies and broken-coloured cats—that is, some colour and white—usually occupy the A.O.C. class. Notable instances of cats with white spots were ‘Cain,’ ‘Nankipoo,’ and ‘Kingfisher,’ all grand blues with this blemish.

“In 1892 Mrs. Pattison’s exquisitely shaped and coated orange-and-white ‘Chicot’ (pedigreeless), then shown as tabby with or without white, established a record by winning as best in show at the Crystal Palace. Other tabby-and-white cats have done well. Miss Malony used to show some good ones; the best, ‘Lindfield Sweet William,’ was a blue tabby-and-white, very massive and heavily coated, son of the smoke ‘Lindfield Bogie.’ Mrs. Pearce, of New Barnet, also used to win with tabby-and-white cats, and Mr.

Law's 'Buffer' was a celebrity in his day, but whether he was a brown tabby or an A.O.C. is doubtful; he was later known as 'Leopold.' The Hon. Mrs. McLaren Morrison had a really good silver tabby with white feet in 'Kepwick Silver King'; and later Miss Snell's grand-headed 'Wonderland' made a small sensation.

"Another good cat which won in an A.O.C. class is Lady Maitland's 'Cheeky Blue,' a lovely blue with a sprinkling of white hairs on her body. Blue and smoke tortoiseshells are freaks, and not really exhibition cats at all, but are by some people considered useful for breeding. Personally, I do not think they are capable of producing anything which a definitely coloured cat of proper ancestry cannot produce as well or better. When cream queens were unavailable they had to be used, but now they are becoming unnecessary. Perhaps the best is Miss W. Beal's 'R. Fluffie.' Mrs. D'Arcy Hildyard's 'Sengo of the Durhams' was another. Miss Taylor's 'Tawney' began life as a blue with a few yellow marks, and wound up as a good tortoiseshell, though a trifle too red. Mrs. Cunliffe Lee's 'Tiger,' a kind of yellow-brown, more ticked than marked, and principally distinguished by his great coat, made his mark in the A.O.C. classes.

"Of blue tabby cats which have won well (mostly bred from blues and silver tabbies) there is a long list. They became common through the craze for blues, as silver queens were sent to blue toms. Later the desire for chinchillas started them afresh, as blue queens were sent to chinchilla toms.

[Illustration:

THE CONQUEST OF THE AIR.

(_Photo: E. Landor, Ealing._)]

"Mrs. Herring's 'Braemar' was a son of 'Cœruleus' by 'Turko'; 'Upwood Dew' and 'Camera' are from the 'Timkins' strain; Miss Jebb's 'Julius Cæsar,' Miss Rae's 'Romanoff,' Miss Nicholay's 'Sacho,' and Miss Jay's 'Holmwood Skittles' were all celebrated cats. Some of these have thrown beautiful kittens, both blues and chinchillas; and as a makeshift, when a correctly coloured cat of the required pedigree is unavailable, they may, when judiciously mated, be found useful; but good breeders will part with all mismarked kittens for pets. The best and most definitely coloured A.O.C. I ever saw was Mrs. Davies' 'Sin Li,' a deep self-coloured chocolate-brown cat. He was supposed to be one of three Swiss mountain cats imported to this country, and he was a most handsome and interesting animal. Unfortunately, he died young, leaving no progeny. Another interesting A.O.C. cat I have seen was a short-haired neuter, red, with black stripes and white paws and chest. In the future I hope to see a variety of strange cats in the A.O.C. classes, but at present they are very uninteresting. Good suggestions for future colours are red, orange, blue, or white with black stripes, chestnut-brown self-coloured, and black with white tips to the fur. So far as I can see, it should be possible by crossing with various foreign breeds to produce in a few years' time cats of all these colours."

[Illustration:

SILVER TABBY AND ORANGE-AND-WHITE PERSIANS.

(_From a Painting by Miss F. Marks._)]

One of the finest "any other colour" cats of the present day is now in the possession of Miss Moxon, of Ilfracombe. "Cinder" was purchased from Mrs. Davies, who has a rare faculty of picking up uncommon-looking cats. Miss Moxon writes:—"I am sending you a detailed description of 'Cinder,' who is a difficult cat to describe, and is quite the handsomest cat I have ever seen. By 'handsome' I mean striking, as she attracts everyone's attention, and very often visitors to our well-filled cattery have not a glance to spare for our other specimens." The following is the description of this very uncommon long-haired cat:—

"'Tors Side Cinder,' winner of many prizes, including second Brighton A.O.C. kitten class, 1899; first A.O.C. kitten, medal, and two specials, Westminster, 1900; first and special for best cat in show, Maidstone, etc.

[Illustration:

GRACE BEFORE MEAT.

(_Photo: E. Landor, Ealing._)]

"'Cinder' was described to me by the lady from whom I bought her in 1901 as 'a very peculiar colour—a kind of tortoiseshell creamy smoke.' She has a dark seal-brown mask and ears, except for one creamy orange (tortoiseshell) splash above left eye, and another

under chin. These give great expression to her face. Head exceptionally fine, considerable breadth of skull, small tufted ears, short broad face, very sweet expression. Round orange eyes, for which she has won more than one special. Fine outstanding frill of a creamy smoke colour; fur on chest very long and feathery, of a creamy, bluish smoke shade, with a pale cream knot in centre. Seal spine line, splashed with creamy brown, shading gradually lighter to shoulder knots and side puffs, which are of a rather darker tint than the frill. Paws and legs of a dark seal-brown; waistcoat and knickers of a bluish cream. Splendid thick brush—upperside to match spine line, under-side of a bluish cream shade. Slightly bluish tint all over, _distinct_ under-coat of palest cream shading to soft creamy blue."

"MARCUS SUPERBUS," A SILVER SMOKE.

OWNED BY MISS SHAW. (_Photo: Moffat, Edinburgh._)]

American fanciers have always shown a partiality for broken-coloured cats, and orange-and-white and blue-and-white cats have classifications given for them at the leading shows. In England there is a marked antipathy to these cats, chiefly because they have little or no value for breeding, though they undoubtedly make pretty pets. As a sign of the times, I may mention that at the Westminster show in 1903 the three "any other colour" classes for males, females, and kittens had to be cancelled, no entries having been made.

Speculative, but, I must add, persevering fanciers might derive interest and amusement from trying to breed out-of-the-common specimens. A black-and-white, spotted like a Dalmatian hound, or a cat marked with zebra stripes, could doubtless be produced in time by careful and judicious selection.

CHAPTER XXI. NEUTER CATS.

[Illustration:

MISS KIRKPATRICK'S "CHILI."

(_Photo: E. Landor, Ealing._)]

It has been my experience in the past year or two that the demand for neuter cats, or, in other words, household pet pussies, is on the increase; and I am inclined to believe that if some fanciers made a speciality of these cats they might do a thriving trade. As it is, owners of male kittens do not care to undertake the trouble and responsibility of having them gelded, or doctored, as this process is sometimes called, and novices in purchasing are always very anxious that the operation should have taken place before they become possessed of their pets. A selling class for neuters at our large shows would not be at all a bad idea, but the age should be limited to eight months, or at most ten months, as it is only natural that purchasers should desire pussies before they reach the prime of life, so that they may grow up as pets in the home. For reasons that are easily understood, it is necessary, if you wish to have a house pet of unimpeachable manners, to have your male cat doctored when he arrives at years of discretion.

For my own part I consider between five and eight months the best time for a cat to be gelded, but I have often known successful operations taking place much later. It is, however, most important that the tom should not previously have shown any desire to mate. In all cases a cat should be kept on low plain diet for two or three days before being neutered, and it is more humane to pay the extra fee for the use of an anæsthetic.

[Illustration:

"KING CY."

SILVER NEUTER BELONGING TO MISS AVERY JONES. (_Photo: F. Bromhead, Clifton._)]

I have been told on good authority that if a female cat is to be made neuter she ought to be allowed to have one litter before the operation is performed. Neuter cats are essentially for the “one cat” person. They undoubtedly make a grand show when exhibited, but those who are possessed of these pet pussies are generally very disinclined to let them run the risks and discomforts of a show pen. I have advocated having neuters shown only in the ring, on the lead. If this course were adopted, I think owners would not mind exhibiting their precious cats, as they could be sent or taken home after their turn round. Certainly neuters are the only cats that ought to be led into the ring, and in this way their fine proportions and generally heavy coats can be seen and judged to the best advantage. It is too often a practice with fanciers to have the worst of the litter kept for a pet and made neuter, and therefore we see many blues with light green eyes, and cats with the blemish of a white spot, in the classes set apart for gelded cats; and if a beautiful, almost perfect, neuter is exhibited, fanciers are apt to protest at what they consider is “a grave mistake.” From the lips of some noted and over-wrought breeders of Persian cats I have heard the exclamation, “I shall go in for neuters only!”

[Illustration:

MISS CHAMBERLAYNE’S “BELVEDERE TIGER.”

(_Photo: J. Atkins, Upper Norwood._)]

This has been called forth, perhaps, by a succession of failing litters or by a rampageous stud cat that has fought with the neighbour’s tom or has wandered off on amorous thoughts intent, perhaps never to return, or on returning to bring disease to the cattery. Certainly, for a thoroughly comfortable domestic pet there is nothing like a neuter cat. They are more affectionate, and with children more docile, not less keen in catching rats and mice, and they are proverbially very clean in their habits. One great advantage that neuters have over the other long-haired breeds is that they retain their lovely coats nearly all the year round. In spite, however, of the many points in favour of neuter cats, they are nevertheless rather looked down upon in the fancy. Certainly, at our shows no cats are more attractive to visitors than the big burly neuters, and I would fain see a better classification for these really fine animals.

A specialist society was started in 1901 by an admirer of these cats, but either through lack of energy or want of enthusiasm the work was not carried on, and the club died a natural death. It remains for some other fancier with a love for pet pussies to start a society, for as it is the neuters fare badly at our shows, the classes provided never numbering more than two, and the special prizes being few and far between. Formerly neuters were judged by weight, and I remember some specimens exhibited at the Palace that really looked like pigs fatted up for market. It was in 1886 that the classification for neuters at the Crystal Palace show ran thus: “Gelded cats, not judged by weight, but for beauty of form, markings, etc.” Happily, therefore, this state of things has been abolished, and though neuters should be big, massive cats, yet they need not, and should not, be lumps of inert fat and fur. It is true that a big show cat appeals to the non-exhibitor, and visitors to our shows are always greatly impressed with huge animals over filling their all too small pens. The heaviest and biggest neuter I have ever seen was possessed by Mrs. Reay Green. This enormous silver turned the scale at 20 lb. I believe the record weight at the Crystal Palace was 25 lb. It is a libel to say that neuter cats are lazy and uninteresting. I have always possessed a neuter, either a blue or a brown tabby, and these beloved pets have ably fulfilled their duties as mice-catchers of the establishment. My “Bonnie Boy,” who but recently joined the noble army of neuters, is as keen as a knife, and will sit for hours watching a likely hole, and never a mouse escapes his clever clutches. He kills them instantly, and then amuses himself for hours dancing about and throwing his dead prey with wild delight into the air. Then, again, he is, I am sorry to say, just as destructive with the poor London sparrows, and many a time I have had to chastise my pet for stalking the game in our little back garden.

Miss H. Cochran, writing of neuters, says: “There are, without doubt, a great number of people who like to keep a cat, especially a Persian, for a pet pure and simple—one that will be the admiration of all, and of service in ridding the house of mice and rats. They will attain a greater size, and in nine cases out of ten retain all the pretty habits and antics of their kittenhood. Neuter cats are often very troublesome in a large cattery; they fight with each other and with the queens, which have a poor chance against their superior size. I think they do it for fun.”

In _Fur and Feather_ “Zaida” thus writes of neuters:—

Undoubtedly it is a crying mistake for neuter cats to be allowed to compete in open classes, but personally I should be delighted to see more classes for them at shows, and much greater interest taken in them. Sometimes one is tempted to think the ordinary run of cats has deteriorated in general beauty, remembering the splendid animals, both English and foreign, which we used to see in friends’ houses in our childhood; but the real explanation lies in the fact that formerly “house” cats were almost entirely kept as pets,

and handsome kittens were obtained for the purpose. Nowadays anything not good enough for breeding from is made a neuter, and fanciers undoubtedly look on them with a certain contempt. Why should this be more the case with cats than with horses? For a perfect household pet the neuter cat holds its own, if only the public would universally acknowledge it. But too often every purchaser of a kitten starts breeding, and multiplies a race of weedy, ill-kept animals, who do little credit to their owner. A cat with kittens is undoubtedly a charming sight; but a female cat is more or less of a worry, and is, besides, only in coat for a very short time each year. Then a tom cat roams, fights, and is often objectionable, but the stay-at-home cat is always a thing of beauty, never requires periods of seclusion, will mouse and rat with the best, and be a credit to any establishment. In short, we should like to see more of them, not fewer, and a neuter class for every colour in a show. In many a household cats are now disliked through the ill-advised action of some member of the family in starting breeding with more zeal than knowledge, and without proper convenience. If a lovely neuter, or even two or three, reigned in their glory, there would be an end to the trouble, to the groans of the other members of the family, to the "wasn't engaged to wait on cats" of the servants.

[Illustration:

"BENONI."

THE PROPERTY OF MISS COTTOR. (_Photo: F. Wallace, Dalkeith._)]

In the schedule of the Beresford Cat Club show, held at New York, January, 1903, the classification for gelded cats reads thus: "Class 25, neuter, white or black; Class 26, neuter, blue or smoke; Class 27, neuter, 'any other colour'; Class 28, neuter, any colour tabby with white." It will be seen, therefore, that in America a much more liberal classification is given for long-haired neuters, and for short-haired there are three classes provided. I do not know, nor have I heard of, any remarkable American neuters, and no photographs have been received by me for reproduction in this work.

If we go back some years in the fancy, I remember Miss Sangster's "Royal Hector," a blue of great celebrity; also same owner's "Royal Bogey," a handsome black with a white star. Miss Boddington's cobby, woolly-coated white "Ba Ba" appeared later in exquisite form, winning well till he was eleven years old. At this same period Mrs. Herring's little smoke "Ally Sloper" and Miss Molony's big, heavily coated black "Uncle Quiz" were noted winners.

Then we come to Mrs. Willman's "Charlie," a fine blue of "Beauty Boy" strain, and Miss Knight's "Albion Joey," one of the finest neuters ever exhibited, a huge smoke with the roundest of heads, a trifle marked and not good in eye, but a glorious animal.

A little later came Madame Portier's "Blue Boy," and, as I have received some notes from the owner of this magnificent cat, I will give them:—"I am very proud of my 'Blue Boy,' born on St. Patrick's Day, 1895. He has won twenty-eight first prizes and many specials, and his championship before he was a year old. I had an offer of £20 for him. The greatest honour 'Blue Boy' received was a caress from her Majesty, then Princess of Wales.

[Illustration:

MISS ADAMSON'S CHINCHILLA NEUTER.]

"I often take my pet out for a walk on a collar, and he is quite easily led, and people often stop and ask if it is really a cat. I send you his photo for reproduction in 'The Book of the Cat.'" One of "Blue Boy's" wins was at the Richmond show, 1902, where he was greatly admired for the dignified way in which he comported himself on a lead. In these up-to-date days, however, "Blue Boy" has to run the gauntlet with superior coloured eyes, but in shape, size, and coat he holds his own. Miss Kirkpatrick's "Chili," now no more, was a beautiful creature—a silvery smoke, almost a smoke tabby, with a wonderful fleecy coat and grand frill. Mrs. Reay Green has always been the proud possessor of superb neuters—"Mosca," a blue; "Abdul Zephir," a chinchilla; and later "Ajax," who has done some winning. Viscountess Esher also has quite a cattery of neuters. I procured for her a sable, almost unmarked and very rich in colour, a white with limpid seagreen eyes, and a Siamese with perfect points. Miss Cochran's "Patpaw" (now in the possession of Viscountess Esher), a son of the celebrated tortoiseshell "Tawney," is rather small for a neuter, but full of quality, with wonderful orange eyes. "Persimmon Laddie," owned by Miss Whitney, is, perhaps, the most perfect specimen that has been seen in the pen of the neuter classes. He is not a brown and not a tabby, but a sable; and, having the blood of the "Birkdale Ruffies" and "Champion Persimmon" in his veins, it is no wonder he carries all before him. No photograph can do him justice.

Mrs. Boyce's "Fur" could beat any male chinchilla now on the show bench; for in colour, shape, and head he is well-nigh perfect. Mrs. Millar's "Lord Bute" is a monstrous black, and in spite of his green eyes is generally in the prize list; but in Mrs. Curtis's "Baron

Bonelli" he met more than his match at the Crystal Palace in 1902. This black cat (a son of "Johnnie Fawe") has all the good points of "Patpaw," including his gorgeous eyes, and he is very large. Miss Holmes' "Blue Tut" has won many honours, and Miss Chamberlayne's "Tiger" is a handsomely marked brown tabby. Miss Meeson's "Fluff Duvals," another brownie, won first at the Crystal Palace and Brighton, and after a second at Westminster came home to die! Miss Averay Jones has a splendid chinchilla neuter "King Cy," a possession too precious to be risked at any exhibition.

[Illustration:

"NIGEL THE RAVEN."

MRS. MELLER'S SHORT-HAIRED BLACK NEUTER.]

So much for the long-haired pet pussies, and we will take a glance at past and present short-haired neuters. A lovely coated cat was "Tiger of Kepwick," owned by Mrs. MacLaren Morrison, a brown tabby, as his name denotes. Then Mrs. Butler's orange, which for many years won at the Crystal Palace and Brighton. Mr. Lane had a good yellow-eyed white, "Leonidas." Mrs. Herring owned a well-marked brown tabby in "Sir Peter Teazle." Of late years the most remarkable short-haired neuters have been Miss Cartwright's really lovely Siamese "Chote" and Lady Alexander's blues, "Brother Gamp" and "Tom Gamp," who are rarely, if ever, defeated. A richly coloured orange tabby neuter, "Red Eagle," also hailed from the same cattery.

In judging neuters, I think it is rather a mistake to go too much by points. I consider size should be a most important factor, also coat and general effect. Of course, in close competition points would come into question; but I really think that a large, heavily coated neuter, whose colour was a trifle unsound, or whose markings or eyes were below par, should not be placed below a small mean-looking cat who, however, excelled in these points.

Louis Wain, writing on a general survey of the Crystal Palace show of 1900, referring to the neuter class that he judged, says:—"Neuters have suffered somewhat through the extended schedule of the 'whole' cats. At one time it was quite a usual thing for exhibitors to have their cats neutered to preserve the natural beauties of a fine cat, and very often a really handsome cat was neutered because he stood no chance in a class of twenty or thirty cats, and yet would take first as a neuter in a class of six or eight. The neuter classes have not grown as have the other classes. As 'home' cats neuters should be encouraged, and I feel sure that many are kept at home in fear of the dreaded 'blues,' which are usually unbeatable." Mr. Wain also complains of the poor classification for neuters at our shows, and on this particular occasion he states that the cats were such extremely fine animals that they needed classes of their own for him to do justice to their merits. Certainly there ought at least to be three classes provided for neuters at our large shows, viz.: Neuters, self-coloured (blue, black, and white); neuters, tabby, "any colour"; and neuters, "any other colour."

RASCALS.

(_From a Painting by Madame Henriette Ronner._)]

CHAPTER XXII. MANX CATS.

These quaint cats are rapidly and surely coming into notice in the fancy. As a breed they are intelligent and affectionate, and, I believe, splendid sporting cats. They are undoubtedly great favourites amongst the sterner sex, perhaps because they are such keen and plucky ratters. As a breeder of Persian cats, and having become used to the beautiful wide-spreading tails of these cats, I confess there is something grotesque and unfinished, to my eyes, in the Manx, and from choice I should not care to keep these tailless pussies as pets. They do not appeal to me and to my sense of the beautiful. Having, therefore, never kept or bred Manx cats, I feel diffident in writing about them; but I have carefully studied those exhibited, and have also had opportunities of judging of their points whilst visiting friends who have fallen victims to the fascinations of these curious felines. I know a good Manx when I see one, and to prove this assertion I will tell an incident in connection with a prize-winning Manx of to-day. A friend of mine living in

London took compassion on a little stray black kitten who came crying for food. She fed him, and repeatedly tried to find poor pussy's owner, but in vain. I was appealed to to know what had better be done, and when I saw the little black fellow I strongly recommended my friend to keep it and exhibit it at the next large show, as I considered he would go in and win easily. She followed my advice in the latter respect, but placed too low a figure on "Nig," as she declared she did not wish to go in for Manx. I warned her he would be sold, and sure enough that clever and astute judge of cats of uncommon breeds, Mrs. H. C. Brooke, snapped him up at catalogue price; and since then he has blossomed forth into a champion, and as "King Clinkie" has taken highest honours whenever shown. It is only just to state that Mrs. Brooke most generously handed over some of her winnings to "King Clinkie's" former owner.

[Illustration:

TYPE OF MANX KITTEN.

(_Photo: Russell & Sons, Windsor._)]

I will therefore proceed to give my opinion of Manx cats, but with all due deference to my fellow fanciers who have had personal experience with the breed. I think I have judged every species of cat, long- and short-haired, except Manx; but if I were given a class of this breed upon which to adjudicate, I should first closely examine their tails, or, to be more correct, the place where the tails ought _not_ to be! I remember in former times stump-tailed cats, called Manx, used to win comfortably at shows, but in our up-to-date times I should make a black mark in my judging book against those cats with a stump or an appendage, or even a mere excrescence. I do not fear contradiction when I state that a Manx cat of the true type should have no particle of tail—only a tuft of hair, which ought to be boneless.

The next point for which I should search would be the length of hind quarters, which lends such great individuality to this breed of cat. No doubt the lack of tail in itself makes a cat's hind legs look long, but we want more than that; we need a very short back, so that from the point of the quarters to the hocks there is a continuous and decided outward slope. In fact, the hind legs stand right back from the body, like a well-trained hackney's in the show ring. Coat I should next consider, as this differs, or should differ, considerably from both the long- and short-haired breeds. It should bear more resemblance to the fur of a rabbit, being longer and softer than that of our common or garden cats. I think a good-shaped round head as desirable in a Manx as in other breeds. As regards colour, the most common would seem to be tabbies, either silver, brown, or orange, and often there is a mixture of white. Self-coloured Manx seem to be much rarer, and Harrison Weir tells us he does not recollect having seen a white Manx.

As regards the colour of eyes in Manx cats, it is the custom to say that they do not matter in this breed; but, nevertheless, a cat that has the correct colour of eye must necessarily beat an animal that has just the opposite to what is set forth in the standard for short-haired English cats.

A lady friend of mine, who was brought up in the Isle of Man, has told me that she always understood that Manx cats came from a cross with a rabbit, but if this supposition is correct it seems too strange to be true that cats and rabbits should only form matrimonial alliances in the little island off our coast! It would appear more probable, therefore, that a foreign breed of cat was brought to the island, and the following article from the pen of Mr. Gambier Bolton gives his ideas on the subject:—

[Illustration:

"GOLFSTICKS."

OWNED BY MISS SAMUELS.

(_Photo: Albert Hester, Clapton, N.E._)]

"In the Isle of Man to-day we find a rock named the Spanish Rock, which stands close into the shore, and tradition states that here one of the vessels of the Spanish Armada went down in the memorable year 1558, and that among the rescued were some tailless cats which had been procured during one of the vessel's voyages to the Far East. The cats first swam to the rock, and then made their way to the shore at low tide; and from these have sprung all the so-called Manx cats which are now to be found in many parts of Great Britain, Europe, and America.

"The tale seems a bit 'tall,' and yet the writer feels so satisfied of its truth that he would welcome any change in the name of this peculiar variety of the domestic cat to sweep away the idea that they sprang from the Isle of Man originally.

“Any traveller in the Far East—Japan, China, Siam, and the Malay region—who is a lover of animals must have noticed how rarely one meets with a really long-tailed cat in these regions, for instead one meets with the kink-tailed (_i.e._ those with a bend or screw at the tip of the tail), the short kink-tailed (_i.e._ those with a screw tail like the bull-dogs), the forked-tailed (_i.e._ those having tails which start quite straight, but near the tip branch out into two forks), and finally the tailless (or miscalled Manx) cats; and the naturalist Kæmpfer states definitely that the specimens of this breed now so common in parts of Russia all came originally from Japan. Again, anyone who breeds these tailless cats, and keeps the breed quite pure, must have noticed how they differ in appearance and habits from the common short-haired cats. They are, and should be, much smaller in size; the coat should be longer and more ‘rabbity’; the ‘call’ is much nearer that of the jungle cat of the East than that of the ordinary cat; and their habits, like those of the Siamese cats, are much more doglike. In all these points they keep closely to what the writer firmly believes to be their original type, the domesticated cats of the Far East.

“The photographs illustrating this article give some idea of the general appearance of these delightfully quaint little creatures, and one notices immediately the great point that all judges look for, viz., the high hind quarters, which is so typical of the tailless breed of cats, the few hairs, which represent the spot where the tail should be, constantly appearing even a few hours after birth, although there is not a sign of a caudal appendage beneath them.

“Kink-tailed, screw-tailed, fork-tailed, and absolutely tailless cats have all been exhibited at British shows of recent years, and the writer, from a personal knowledge of nearly all breeds, has no hesitation in recommending the latter as companions, their quaint and doglike ways making them general favourites whenever they are met with.

[Illustration:

SPECIMEN OF A MANX TABBY.

(_Photo: C. Reid, Wishaw._)]

“There are at present six distinct types of Manx, or ‘rumpy,’ cats being exhibited at our shows, viz.: The long straight-backed cat, the long roach-backed cat, the long straight-backed cat with high hind quarters, the short straight-backed cat, the short roach-backed cat, the short-backed cat with high hind quarters. The last type is the correct one, the first is the worst and commonest type, the others are intermediate and should be judged accordingly.

“Manx cats should always be judged in a good, large, empty pen, and never in their own pens, or when held by the judge.

“_Coat._—Exactly the opposite to the ordinary domesticated short-haired cat. A long and open outer coat and a soft, close under-coat is the correct thing.”

At one time, we may presume, the Manx cat was kept pure in the Isle of Man; but, alas! the natives, with an eye to the main chance, have been led into manufacturing a spurious article, and many more tailless cats and kittens than ever were born have been sold to tourists eager to carry home some souvenir of the island to their friends on the mainland. I have been told that the landing pier is a frequent resort of dealers in so-called Manx cats, where the unwary traveller is waylaid and sold! On some out-of-the-way farms on the island I believe none but tailless cats have been kept for generations, and some genuine specimens may thus be picked up, if the tourist gives himself the trouble to go off the beaten tracks.

The following letters which appeared in _Our Cats_, in the issue of June 30th, 1900, will be read with interest. They were written by two gentlemen of prominent position in the Isle of Man, but as they did not wish to be identified as authorities on cats their names were not given:—

[LETTER I.]

Castletown, Isle of Man, 12th July, 1898.

I received yesterday your letter respecting Manx cats. I fear I am unable to aid you much in your inquiries as to the Manx cat, for any personal information I can give.

When I was a boy there was a kind of tradition that the tailless cat was brought here by the Spanish Armada. We have a headland called “Spanish Head,” where it has been believed that some tailless cats escaped and took refuge here, and that from such cats all the so-called Manx cats have been derived. During my life I have frequently met persons who have travelled in Spain, and I think

I have always asked from such persons if they had ever met with tailless cats there, but I never met anyone who had seen them. I never heard any other (traditional) origin of the Manx cat alleged. They are very common here, but not so common as cats _with_ tails. Both cats with and cats without tails associate together. In my own house we have always kept cats, and in almost every litter of kittens there are some with and some without tails. I have two tailless cats now—one is a kitten of a few weeks old. It has no sign of a tail, but is (as designated here) a pure rumpy. The mother is one also, but she has a little fur tuft. I have frequently seen kittens having a very small “rudimentary tail,” such as one or two bones.

I have seen, I think, Manx cats of most of the colours mentioned by you, but the most common are the grey or tabby.

I have never heard of wild cats found here, and I do not think there is any tradition about them.

A few years ago I had a very fine tom cat (bred in my own house), black all over, and with no sign of a tail. I lost it. I presume it was stolen by some tripper. Trippers are frequently on the look out for Manx cats, and I fear that many tailed kittens are deprived of their tails to meet the demand.

[LETTER II.]

Ramsey, 17th July, 1898.

Thank you for letting me see the interesting letters about Manx cats. I suppose the Society wants to have a standard by which to judge them.... I am sure we should all be interested to hear what they have to say on the subject, and we may be able to add some general information.

To take the questions in order I should say that grey tabby (barred, not spotted) is the most natural and correct, if one may so speak. I think it is certainly most common. I have known tortoiseshell, black-and-white, black, white, and perhaps others, which I now forget. The eye, so far as I know, is the same as in the common English tabby.

Certainly we have cats with tails—the rumpy being the rare form. Perhaps one in a litter, and one or two of them with half-tails.

As to what they are supposed to be, I have of course heard the Spanish Armada story. My own belief is that they have originated in _a sport_, _e.g._ as we find in dogs and fowls, and have been perpetuated as curiosities, and in modern times on account of their commercial value.

I do not know that there is any type which can be said to be more true than another with regard to size and shape of head, etc. The height at the hind legs is perhaps more apparent than real, caused by the abrupt ending, without the falling tail as in ordinary cats.

Professor Owen made a preparation, which may be seen at the British Museum, showing the bones (if any) of the tail. I think in a perfect specimen there should be no bones. Of course, there are all degrees of stumps.

It is only of recent years that any English fanciers have tried to breed true Manx cats. Miss Samuel has been very successful in establishing a strain which again and again breeds true to type. The “Golfsticks” and “Kangaroo,” two noted winners, are owned by her. In former days Miss Bugden’s “Gorrie,” Mr. Woodiwiss’s “Manx King,” “Pickles,” “Belle,” and “Beauty,” all good cats, accounted for most of the prizes. Miss Jay, whose name is more familiarly known in connection with blue Persians, has always been partial to Manx cats, and used to exhibit at the Crystal Palace. The last time I visited the Holmwood cattery I was much struck with the number of tortoiseshell Manx cats running about the stable yard. Miss Jay has quite a family of these; but, needless to say, they are all of the female sex! Mrs. Herring has not been unmindful of this breed, and has exhibited some good specimens. Miss Dresser has owned Manx cats for many years and shown some good ones. Her “Belle Mahone” and “Moonlight” were nice tabbies, free from tail, and “Bonhaki Junior” was a very fine-shaped silver tabby-and-white; but, unfortunately, he had a stump which always kept him back. Mrs. Mosely has exhibited some good blacks. Lady Alexander owned several prize-winning Manx, but these have passed into the hands of Miss Hester Cochran. The best of these are “Ballochmyle Bell Stump,” a curiously spotted tabby, absolutely tailless. “Bell Spitz” and “Strathcona” are also good specimens in Miss Cochran’s possession. Mr. Gambier Bolton owned and bred some fine cats. “Manx Primrose,” a black, and “D-Tail,” a silver tabby, won respectively first and second at the Westminster show in 1902. It is so usual to see “Breeder and pedigree unknown” after almost all the entries in the Manx classes that these two cats were distinguished by having a certified pedigree. It was a grievous loss when “D-Tail” disappeared very mysteriously from his home in St. John’s Wood. “Manx Silverwing” passed from Mr. Bolton’s possession to that of Mr. Foulstone’s, and was later purchased by Mr. A. Ward, the well-known cat specialist. As will be seen from the illustration on page 251, this puss

is almost a spotted tabby.

[Illustration:

ORANGE MANX.

OWNED BY MRS. CLINTON LOCKE. (_Photo: S. S. Finley, Chicago._)]

Lady Marcus Beresford has lately shown a great partiality for Manx. I think I am right in stating that the first one that inhabited the Bishopsgate cattery was a beautiful white called “Mona,” that I procured for her. This fine specimen was brought from the island direct, and proved herself a splendid ratter; but, alas! she did not live long to enjoy the luxuries of her new home. There are, however, no fewer than five Manx now at Bishopsgate—“Jack,” a silver tabby; “Patch,” a tortoiseshell; “Satanella,” a black female; and “Stumps,” a brown tabby male. The most recent addition is “King Clinkie,” whom I have before mentioned as being owned by Mrs. H. C. Brooke. Does he ever think of his former struggling existence, now that his ways are those of pleasantness and peace? One of the latest of the specialist clubs is the Manx Club, formed by Miss Hester Cochran in 1901, with an annual subscription of 10s.; this has been reduced to 5s., and the members in the beginning of 1903 numbered about twenty. The club has, as far as possible, devoted its limited funds to guaranteeing a better classification for Manx cats at the principal shows, and when unable to afford a guarantee has given special prizes for competition. The efforts of this small body of fanciers have been substantially rewarded by the great improvement in the quantity and quality of the Manx cats exhibited during the last eighteen months. Miss H. Cochran, who has given up all other cats for Manx, is the hon. secretary, and Lady Alexander hon. treasurer. Committee: Lady Alexander, Miss H. Cochran, Mrs. Herring, and Miss White Atkins. No doubt in time the officials and members of the Manx Club will be able to add to their number.

[Illustration:

MRS. H. C. BROOKE’S MANX, “KATZENJAMMER.”

(_Photo: A. R. Pickett, Bexley Heath._)]

The following is translated from a paragraph in a German weekly paper called _Mutter Erde_, and appeared in _Our Cats_ of March 1st. 1900:—

THE PROGENY OF A TAILLESS CAT OF THE ISLE OF MAN.

A cat brought from the Isle of Man (_felis catus anura_) to S. Germain en Laye, of which the pedigree is unknown, was mated with ordinary long-tailed cats, and among twenty-four kittens the four following different kinds appeared:—

I.— Kittens with ordinary long tails.

II.— Kittens with short and stump tails.

III.— Kittens without tails, like the mother.

IV.— Kittens without the least sign of a tail.

The comparison between the influence of the sire and that of the dam on the young is interesting:—

1 litter. 1 kitten like the mother. 2 „ 6 kittens, 5 like the mother, 1 like the father. 3 „ 5 „ 3 „ „ 2 „ „ 4 „ 3 „ 1 „ „ 2 „ „ 5 „ 4 „ 1 „ „ 3 „ „ 6 „ 5 „ 3 „ „ 2 „ „

It will be seen that the influence of the mother predominates.

Manx cats may be considered shy breeders, and constantly the litter will consist of one kitten only! I have been told that they are excellent mothers; but, in the words of a Manx fancier, “they only care to have one family a year, many queens won’t breed at all, and heaps of males are very funny and take no notice of their wives!” Another breeder of Manx informs me that these cats seem entirely fearless with dogs, and that her canines and felines live together in perfect amity. I believe Mr. H. C. Brooke once exhibited a Manx in the same pen as a bull-dog at the South London Bull-dog Show of 1893. And now, having mentioned Mr. Brooke’s name, I am pleased to say that this well-known and successful fancier of Manx, as well as foreign, cats has kindly written an article on this variety, which is his pet speciality:—

[Illustration:

“BALLOCHMYLE BELL SPITZ.”

OWNED BY MISS HESTER COCHRAN.]

“On this breed I think I may claim to write with some authority, as I have kept it for a number of years, and it has always been my favourite breed of cat. I believe I may, without boasting, say that I have of late years been of some service to the breed, by constantly agitating for the Manx classes to be entrusted to judges who take some interest in the variety; for it is a lamentable fact that there are numbers of people, good judges of the more popular breeds, who are quite willing to adjudicate upon the Manx classes without possessing the slightest qualifications, and these usually merely judge the Manx as a tailless cat, which is all wrong. During the last few years I am glad to say that the National Cat Club, at almost all its shows, instead of tacking the Manx classes on to the list of any all-round judge, has appointed capable judges; and whilst, of course, no judge has ever succeeded in pleasing all concerned (except when there was only one entry in the class), the awards at these shows have always been reasonable and sound, and free from the absurdities which too often sicken fanciers and render the judge ridiculous at other shows. When we find an all-round judge openly stating that a Manx is but a tailless cat, and that he could manufacture perfect specimens, it is high time that that judge’s name, however excellent a judge he may be of other breeds, should be inscribed upon the tablets of every Manx fancier’s memory, and when he again officiates he should be saved the trouble of going over cats which he neither likes nor understands.

“‘What is a Manx but a tailless cat?’ some may ask. Well, a cat with, perhaps, an inch of tail, though in my opinion unfit to win a prize, may possibly be really a better Manx, more calculated to do good to the breed, than an absolutely tailless cat. It may possess more Manx character, and this Manx character is a thing not ‘understanded of the people’; and here it is that those judges score who have taken a real interest in and studied the breed. A cat may have a couple of joints of tail, crooked or straight, and yet be a pure Manx; though, as we strive for perfection, I consider that such cats should be relegated to the stud, or at most only be placed in the money if the competition be very weak, and then never awarded any high prize.

“If breeders of Manx were more careful, there should be no difficulty in obtaining litters without any tail whatever. No cat can be a really typical Manx who is long-cast in the body. A short, cobby body is an essential in a show Manx. So also is a round, short skull. These points are usually noticeable when the kittens are young; as they grow older they disappear, frequently to return when the cat has outgrown its kittenhood. But the most important Manx property is the great length of hind leg, which absolutely marks the typical Manx as a cat quite distinct from a tailless cat; with this should be coupled a round, guinea-pig-like rump, round as an orange, which, of course, can only be obtained when there is absolutely no tail. Even a tuft of gristle or hair, as found in many of the best specimens, though in itself but a very trifling defect, detracts from this typical ‘rumpy’ appearance, by giving a more or less angular appearance to the hind quarters, unless, that is, it be situated so far back between the hip-bones that it in no way projects. As typical specimens showing this rumpy formation to perfection, I may mention the late ‘Champion and Premier Katzenjammer,’ and ‘Ballochmyle Bell Stump,’ probably two of the best ever seen in this respect. Had these two been mated, what glorious progeny should have resulted. Now these two cats, whilst possessing the round rumpy formation to perfection, did not excel so much in length of hind leg, and for superlative excellence in this property we must turn to another celebrated couple, the late silver tabby ‘Champion and Premier Bonhaki’ and ‘King Clinkie,’ who has just passed into the possession of Lady Marcus Beresford, and who at the age of about fifteen months has already twice won championship awards. Now, these two cats exhibited the great length of hind leg which gave them when in motion the desired comical rabbity action; but in roundness of rump they lost to the other two, being somewhat more angular.

“To gain absolute perfection we require _roundness of rump_ united to _great length of hind leg_. These are the great characteristics of the Manx, to which every Manx judge worthy of the name will attach the greatest importance. Then come other body properties—shortness of back, general cobbiness, roundness of skull, small ears, shortness of face; then, last of all, colour. And here it is that the average all-round judge goes astray, for in too many cases he attaches too much weight to colour, a good instance of which occurred when ‘Ballochmyle Bell Stump,’ above referred to, whose colour, though quaint, is not very pleasing, was placed below a long-cast cat of a taking colour, but in no wise a typical Manx.

“As I before remarked, colour should be considered last. I think a good black is the nicest colour for a Manx, and, of course, the eyes should be of the colour sought for in ordinary black cats. A pure blue-eyed white is very pretty, and also very scarce. Tabby-and-white I personally do not care for. Silver tabbies are uncommon and very handsome. Tortoiseshells are also pretty and

quaint.

“The fur of the Manx should be just a little longer and softer than that of the ordinary short-haired cat. Now and then we see long-haired Manx advertised, but these are, of course, mongrels or abortions, and by no means Manx cats.

“What is the origin of the Manx? That is a question which in all probability will never be answered. The theory that it originated from a cat (or cats) having lost its tail by accident I do not consider worth a moment’s consideration. Such a cat might well have tailless progeny, but that would have nothing to do with the abnormal length of the hind legs, which in good specimens is patent to the most superficial observer, and which makes the gambols of a couple of Manx a comical sight calculated to excite laughter in the most mournfully disposed person.

[Illustration:

MANX CAT.

(_Photo: Gambier Bolton, F.Z.S. [Regd.]._)]

“Quaint is the old versified explanation, which I remember hearing some years ago. It ran, if I remember rightly, somewhat like this:—

Noah, sailing o’er the seas, Ran high and dry on Ararat. His dog then made a spring, and took The tail from off a pussy cat. Puss through the window quick did fly, And bravely through the waters swam, Nor ever stopped, till, high and dry, She landed on the Isle of Man. Thus tailless puss earned Mona’s thanks, And ever after was called Manx.

“The most feasible explanation, in my opinion, though of course it can be but a theory, is that these cats were originally imported from the East. Asiatic cats of domestic varieties show remarkable variety in the shape of their tails, as witness the kinks often found in the tail of the Siamese cat, and the knot tails of other varieties. This subject will be referred to again in a subsequent paper.

“It is also noticeable that many Manx, like the Siamese, are very doglike in their habits, showing extreme affection for their owners. Poor old ‘Katzenjammer,’ for instance, would follow me to the railway station, and many a time on my return from town have I found him sitting in the middle of a field waiting for me, and on seeing me he would accompany me home just like a dog.

“To return to the question of the Manx cat’s tail, this should, of course, be like snakes in Iceland—absent. What we want is for the spinal column to come to an end high up on the back, so that on placing the finger where the tail would begin a hollow or depression is felt. This is the perfection, but it is not always obtainable in even the very best specimens. Next to be desired is when only a little tuft of gristle and hair, with at most a suggestion of a twisted and withered bone, is present. Then comes a distinct caudal vertebra, if twisted or abnormal in shape so much the better; but in my opinion more than two joints should not be allowed in show specimens at all, though such cats, as I remarked above, may be valuable at stud for breeding from. But I see no reason, if Manx breeders would pay more attention, and incompetent judges were barred, why absolute taillessness should not be attained in ninety-nine kittens out of each hundred. I have bred many, but none have had the crooked stumps we often see in otherwise good specimens.

“I do not care for large Manx, which generally look coarse. Here, again, the all-rounder often goes astray, and unduly favours a large cat.

“I can heartily recommend the Manx as a pet, and the quaintness of his movements are certainly a recommendation. My cats are all house pets, so that I can watch them and enjoy their company; the ‘cattery’ cat is abhorrent to me. I cannot understand why so few people go in for rationally breeding this quaint variety. I had hoped that the recent purchase by his Majesty of two couples of the breed might have given it a fillip.

“To illustrate the breed, I may perhaps be accused of egotism in giving the portrait of one of our own cats, but as he is dead it is less invidious than if living specimens were selected, and as they were awarded the very highest prizes by the very greatest authorities they may safely be taken as near perfection. The silver tabby ‘Champion and Premier Bonhaki’ was bred by Mr. Jungbluth, one of the keepers of the monkey house at the Zoo. He made his _début_ at the Botanic Gardens as a kitten, when he was much admired by the then Princess of Wales, and Mr. Wain awarded him the championship. This success he followed up by winning four others under various judges, and died at the early age of twenty-seven months. ‘Champion and Premier Katzenjammer’ was bred at home; he did not commence his show career till late, and then he had to meet ‘Bonhaki,’ after whose

death, however, he was unbeaten, and had earned his champion title at the time of his death from gastritis last year, which robbed me of one of the most affectionate ‘pals’ man ever had, and I am not ashamed to own that many and bitter were the tears I shed over his grave.

[Illustration:

BROWN TABBY AND ORANGE TABBY SHORT-HAIRED CATS.

(_From a Painting by W. Luker, Jun._)]

“In conclusion, I would advise Manx fanciers to do their best to accustom their cats to seeing strangers, to being handled, and to the show pen; for when a cat is nervous and crouches in a heap it is most difficult to see whether the desired shape of hind quarters and rabbity action are present. They can best be seen when the cat holds itself fearlessly and boldly; and when a judge has a large number of classes to get through in a short space of time, in very likely an ill-lighted building, he cannot spend half an hour coaxing each cat to show its action.”

CHAPTER XXIII. SIAMESE CATS.

I have often remarked at our cat shows that strangers in the fancy will inquire and ask to be directed to the Siamese class, and many and varied are the exclamations of surprise and admiration expressed by them on seeing, perhaps for the first time, a row of Siamese cats seated in their pens. Nor is it always necessary to direct visitors to the Siamese classes, for generally these animals will betray their whereabouts by the unique tone of their voice, which is distinguishable at a great distance.

There is certainly a great fascination about this peculiar breed of cats, which is yearly becoming more popular and fashionable. But fanciers are also learning a lesson in the school of experience, where frequently the fees are high, that they dare not trust their valuable specimens on the show bench. Siamese cats seem to be more sensitive than even the most delicate of long-haired breeds, and if attacked by any of the ills that catty flesh is heir to they do not appear to have any stamina to bear up against the ravages of the disease. Their recuperative powers are almost nil, and they rarely pull through a severe illness. I have never kept Siamese myself, but I have had many opportunities of observing them in sickness and in health. I have seen grown-up specimens go out like the snuffing of a candle with acute pneumonia, almost before one has realised they were even ailing. These creatures are quite human in the way they look at you with those bonnie blue eyes, and when you talk to them they seem to answer in their croaking voice. I can well understand what companionable cats these may become, and to fanciers of this unique breed other cats must appear lacking in interest and wanting in intelligence.

From time to time there have been discussions in our cat papers on Siamese cats in general, and on their kinked or kinkless tails in particular. It is certain that those cats known to us as royal Siamese are not the only species in Siam, the common cat of the country being tabby or black. So many of my friends who are fanciers and breeders of Siamese have kindly supplied me with interesting facts concerning this variety, that I do not intend to enter into any details, but will state that in 1902 a Siamese Cat Club was started by several enthusiastic admirers of this breed, and the members have certainly done much to improve the classification at shows, by offering prizes and guaranteeing classes.

The following is a list of the officials of the specialist club, with a standard of points for royal Siamese cats:—

President.—Mrs. Vary Campbell.

Vice-Presidents.—The Lady Decies, Mrs. Vyvyan, Miss Sutherland, The Hon. Mrs. McLaren Morrison, Mrs. Chapman, and Miss H. Cochran.

Committee.—Mrs. Parker Brough, Mrs. Carew Cox, Miss Derby Hyde, Mrs. C. B. Robinson, Mrs. A. Spencer, Miss Forestier-Walker, Mr. Gambier Bolton, and Mr. C. W. Cooke.

Hon. Treasurer.—Mrs. Parker Brough, Springfield, Kettering.

Hon. Secretary.—Miss Forestier-Walker.

Hon. Auditor.—Conrad W. Cooke.

STANDARD OF POINTS FOR THE “ROYAL” SIAMESE CAT.

Body Colour.—As light and even as possible, cream being most desirable, but fawn also admissible, without streaks, bars, blotches, or any other body markings.

Points, _i.e._ mask, ears, legs, feet, and tail, dark and clearly defined, of the shade known as “seal” brown.

Mask.—Complete, _i.e._ connected by tracings with the ears, neither separated by a pale ring (as in kittens) nor blurred and indistinct, the _desideratum_ being to preserve the “marten face,” an impression greatly aided by a good mask.

Eyes.—Bright and decided blue.

Coat.—Glossy and close lying.

Shape.—Body rather long, legs proportionately slight.

Head.—Rather long and pointed.

[Illustration:

THE GARDEN CATTERY AT BISHOPSGATE.

(_Photo: Cassell & Company, Limited._)]

General Appearance.—With points emphasised above, a somewhat curious and striking looking cat, of medium size; if weighty, not showing bulk, as this would detract from the admired “svelte” appearance. In type, in every particular, the reverse of the ideal short-haired domestic cat, and with properly preserved contrasts of colour, a very handsome animal, often also distinguished by a kink in the tail.

Remarks.—While admitting that blues, blacks, whites, tabbies, and other coloured cats may be also cats of Siam, these being common to all parts of the world, this club recognises only as Siamese cats those cats the points of which conform to the above standard, and is, in fact, desirous of encouraging the breeding of those particular cats first made known to British fanciers as the “royal” Siamese.

The points of the “chocolate” Siamese are the same as above, with the exception of body colour.

VALUE OF POINTS.

Body colour 20 Shape 10 Coat 10 Head 10 Eyes 20 Mask 15 Density of points 15 ——— Total 100

Any cat failing to obtain 75 of the above marks shall not be eligible for the club’s challenge prizes and medals.

It was shortly after the formation of the Siamese Cat Club that the following letter appeared in _Fur and Feather_:—

POINTS OF THE SIAMESE.

The committee of the Siamese Club wish to draw attention to the unfortunate diversity of opinion concerning Siamese cats expressed in articles which appear from time to time in some of the papers which devote a portion of their issue to cat news. One great object of the Siamese Club is to encourage the distinct breeding of the royal cat of Siam and also of the chocolate cat of

Siam—both beautiful in their own way, but recognised as distinct breeds. The Siamese Club is young, and not infallible; but, containing as it does most of the principal breeders and exhibitors, its committee would like to record their opinion on some few points which have appeared in the Press, in order to avoid a silence which might be construed as consent. With regard to colour, they cannot agree that a royal can be too light in body colour, nor can they endorse “we like a rich cream body, chocolate saddle, and the points glossy black, shading away to chocolate.” Another paper advises the mating of royal Siamese with the chocolate variety. It is true that the young kittens are very pretty, but after six months old quickly become dark and blurred. The great beauty of royal Siamese is the contrast between the sharply defined, deepest brown markings and a body of as light a cream as possible. A third paper gives the information that an exhibitor known to it has bred prize-winning Siamese from a cross between a white cat with blue eyes and a Siamese queen. It also mentions another case where such crossing has produced good Siamese kittens, and thinks that many other people have, with more or less success, followed the same tactics. The above experiment has often been tried, purposely and accidentally, but no case is known to the writers where the result has been anything like Siamese, the kittens always favouring the English parent. All Siamese are born white, and therefore if the children of one white parent died quite young such a mistake might be natural. It certainly would be very unfair to sell such kittens, as their progeny would inherit, and might pass on, an English parentage, not even necessarily white. A white is, or may be, merely an albino variety.—(Signed) A. Forestier-Walker, Jean A. Spencer, May Robinson, L. Parker Brough, S. E. Backhouse, Constance Carew Cox.

[Illustration:

MRS. ROBERTS LOCKE, WITH “CALIF,” “SIAM,” AND “BANGKOK.”

(_Photo: S. S. Finley, Chicago._)]

Miss Forestier-Walker and Mrs. Vyvyan were amongst the first to introduce Siamese cats into England, and they have always owned a direct descendant from the first and famous “Tiam-o-Shian,” and many are the prize-winners they have reared and shown from this celebrated strain. Miss Forestier-Walker has frequently acted as judge of Siamese, and took a very active part in the formation of the specialist club for this breed. She has kindly furnished me with the following notes, and given me some photographs of Mrs. Vyvyan’s cats:—

[Illustration:

“SI.”

THE PROPERTY OF W. MARGETSON, ESQ. (_Photo: H. J. Comley, Stroud._)]

“Siamese cats were first introduced into England about twenty-five years ago, but were not often seen until a few years later. Among the earliest were those belonging to Sir Robert Herbert, Lady Dorothy Nevill, the Rev. S. Baring-Gould, Mrs. Cunliffe Lee, Mrs. Vyvyan, and myself. Since then they have become fairly common.

“There are two distinct varieties in the present day. (1) The royal cat of Siam, cream-coloured in body, with sharply defined seal-brown markings on head, ears, legs, feet, and tail; eyes a decided blue. The cats generally become darker after two years old, but where great care has been taken in breeding the true royal cats keep the light colour longer. In any case the body colouring should be even, not blotched or striped. The larger, lighter-coloured cats have china or ultramarine blue eyes; the more slender, darker cats have deeper-coloured eyes. (2) The chocolate cats are deep brown in colour, showing hardly any markings, and have blue eyes.

“All Siamese kittens are white when born, but in a few days slight markings appear on tail, ears, and paws, and by four months old the markings are dark and complete, excepting those which connect the face and head; these are seldom perfect before eight months old.

“The tails are sometimes straight, which is not a fault; but a knot or kink in the tail is a peculiarity of the breed, and therefore desirable. In England it has been asserted that this is a defect, but in Siam it is highly prized, and cats from the royal palace which have been given by the King as presents of value to important people have had this distinction. In the East a cat with a kinked tail fetches a higher price.

[Illustration:

“TIAM-O-SHIAN IV.”

OWNED BY MRS. VYVYAN. (_Photo: Speight, Kettering._)]

“The Siamese have a great affection for animals, and there is no doubt that the cats are much valued, those in the royal palace having been kept exceptionally pure.

“There is a legend that the light-coloured cats, with blue eyes, represent silver; the dark cats, with yellow eyes, gold; and that the possessor of both will always have plenty. This rather gives the idea that originally the eyes of the pure chocolate cat were yellow, and that the present variety has been crossed with the royal cat.

“Mr. Young, of Harrogate, had some years ago a chocolate cat with yellow eyes.

“Another belief is that they receive the souls of their owners at death, and it is well known that the King of Siam had one on board his yacht when visiting Europe a few years ago.

[Illustration:

“IT.”

OWNED BY LADY MARCUS BERESFORD. (_Photo: Russell & Sons, Windsor._)]

“It is a great mistake to mix the varieties, as the result after they become adult is a blurring of the markings and a patchy coat.

“The males are extremely powerful, and will kill strange cats and fight dogs. They are devoted to their wives and children, and to their owners. They are exceedingly intelligent. With the dogs of the house they will be on excellent terms.

“The litters vary in size, but four to five is the usual number. The kittens are difficult to rear, as they suffer from worms and teething, but after seven or eight months old there is little danger. Some people think a meat diet best, but I find it satisfactory to bring them up on lighter food, such as Ridge’s food, milk, gravy, and fish, until they begin to cut their teeth, when meat is required.

“A pair from the Palace were given to Mrs. Vyvyan and myself in 1884–5, and we have been very careful in breeding, mating when possible with such good cats as Mrs. Lee’s celebrated ‘Meo,’ Miss Moore’s ‘Siam,’ Mrs. Harrington’s ‘Mechi,’ etc, and have bred in consequence the famous ‘Tiam-o-Shians’ II., III., and IV., ‘Polyphema,’ ‘Susa,’ ‘Kitya Kara,’ ‘Goblin,’ ‘Champion Eve,’ ‘Mafeking,’ ‘Vishuddha,’ ‘Ah Choo,’ ‘Suzanne,’ and many others.”

Among fanciers and importers of Siamese cats in the past, I may mention the Hon. Mrs. McLaren Morrison, Lady O’Malley, Lady Decies, Mrs. Brodie, Mr. Temple, Mr. Gambier Bolton, Miss Moore, Mrs. Elliott Hill, Mrs. Cunliffe Lee (owner of the celebrated “Meo”), and Mrs. Carew Cox, who later in this article will give some account of her “King Kesho” and the breed with which her name is still associated. Mrs. Herring has exhibited good specimens from time to time. Mrs. Chapman’s “Wally Pug” used to cross the Irish Channel to visit English cat shows. Mr. Young and Mr. Inman, both of Harrogate, favoured this breed, and had some lovely cats. Mrs. Nield owned a charming little female named “Mintha-mee”; and Miss Sutherland, who lives in the south of France, used to breed a lot of good Siamese from her imported “Prince of Siam.” Several of her breeding have been sold in England, and have won at shows. Mrs. Patton Bethune has often exhibited, and is an ardent admirer of the breed. Mrs. Parker Brough, in whose care “Tiam-o-Shian IV.” is placed by Mrs. Vyvyan, is well known as a Siamese breeder, as is also Mrs. Spencer, of Eye Vicarage, who exports quite a number of cats; one of her breed—owned by Mr. E. Ratcliffe—is a beautiful animal. Mrs. Vary Campbell, the president of the Siamese Club, is a generous supporter of the breed. Mr. and Mrs. W. R. Hawkins have always had some fine specimens; and Mrs. Hankey, Miss H. Cochran, Miss Derby Hyde, and Miss Armitage are among others who owned some notable Siamese cats. Mrs. Backhouse’s “Champion Eve” was a distinguished prize-winner, and Mrs. Robinson’s “Ah Choo” was chosen as a model for the medal of the Siamese Club. But it is chiefly as the owner of the celebrated “Champion Wankee” that Mrs. Robinson is known in the cat fancy in general, and among Siamese breeders in particular. “Wankee” was the first Siamese to win the title of “Champion.” He was bred in Hong-Kong, his mother—“Nims”—being a stolen palace kitten. “Wankee” was six months old when he arrived in England: and was born in September, 1895. He has won over thirty prizes, but was never shown till June, 1898, therefore losing the time in which most Siamese cats gain their honours—namely, between six months and two years, when they are pale in colour of coat.

[Illustration:

MR. RATCLIFFE’S SIAMESE.

(_Photo: Hartley, Burnley._)]

Many are the prize kittens he has sired, too numerous to mention. Mrs. Robinson, who is a member of the National Cat Club committee, has frequently acted as a judge of Siamese, and has kindly written the following account for this chapter:—

“One of the most beautiful of the short-haired cats is undoubtedly the royal cat of Siam, and the breed is greatly increasing in popularity; but is never likely to be common, as the cats are delicate in this country. The best description is that drawn up by the Siamese Cat Club in their standard of points. The points of the chocolate Siamese are the same as the royal, with the exception of body colour, which is a dark rich brown all over, thus making the markings less noticeable. All Siamese cats darken with age, and when they get dark there is a tendency to call them chocolates. I know of only one real chocolate—Mr. C. Cooke’s ‘Zetland Wanzies’—so consider them more likely to be a freak than a distinct variety.

“Of the royals there seem to be two types in England: the one—rather a small, long-headed cat, with glossy, close-lying coat and deep blue eyes, and with a decided tendency to darken with age—is generally the imported cat or having imported parents; the other is a larger cat, with a rounder head, a much thicker, longer, and less close-lying coat, and the eyes a paler blue (these cats do not darken as much or as soon as the other type, and have generally been bred for several generations in England).

“The kittens are born absolutely white, and in about a week a faint pencilling comes round the ears, and gradually all the points come. At four or five months they are lovely, as generally they retain their baby whiteness, which contrasts well with their almost black ears, deep brown markings, and blue eyes. Some kittens are much longer than others in getting dense, these making the lightest cats.

“This breed is said to be kept very carefully in the palace in Bangkok—hence the title ‘royal’—and is by no means the common cat of Siam. One gentleman (a missionary), who had lived there fifteen years, had during that time seen only three. A few years ago there was a pair of these cats in the Zoological Gardens at Bangkok, but they were very poor specimens.

“They have occasionally been given by the King as presents of great value, and several pairs have come to England in this way; also kittens have undoubtedly been stolen from the palace from time to time.

“There is a legend that these cats were kept exclusively and with great care in the King’s palace, as resting places for royal souls. The Siamese are Buddhists, and consequently believe in the transmigration of souls; but with the growth of Western ideas and Western scepticism I doubt this being admitted.

“They are very intelligent, almost doggy in their ways, and very affectionate, but not universally friendly. The males are great fighters, and freely use their terrible voices; but they are well suited for house pets, as they seem happiest with their human friends.

“The first specimens were brought to England about twenty-five or thirty years ago, and Mr. Harrison Weir says that among those who possessed them were Lady Dorothy Nevill, whose cats were ‘imported and presented by Sir R. Herbert of the Colonial Office. The late Duke of Wellington imported the breed, also Mr. Scott of Rotherfield.’”

[Illustration:

LADY MARCUS BERESFORD’S “URSULA.”

(_Photo: E. Landor, Ealing._)]

Miss Armitage, of Chaseleyfield, Pendleton, has sent me some charming photographs of her pets. She writes:—

“I have very few cats at present; I lost so many beautiful Siamese last year, and I think I made rather a mistake in having their skins made into mats! ‘Cora,’ the mother of my Siamese cats and kits, is still a beauty, and I really think she improves with age; and though her eyes are not all I could wish for in colour, yet her kittens have always had the desired tone of blue. I have now a lovely daughter of ‘Cora’ and ‘Champion Wankee,’ aged nine months. When she was a few hours old I put her to be fostered by our old English garden tabby, who makes her headquarters in the greenhouse. This kitten has never had a day’s illness. She leads a wild life, catching birds and mice, and nibbling the tips off the ferns—much to the gardener’s annoyance. I am hoping to send her to our next National Cat Club show, if I can catch her that day, but she is generally up a tree when wanted!

“I find the way to succeed in breeding and rearing Siamese kittens is to only keep a few. I strongly believe in putting them forth into cottage homes. Distemper spreads like wildfire amongst this breed, and it is heartrending to lose whole litters at once. It is strange

how much stronger the females are than the males. I have never lost a female kitten yet; but, alas! many a promising male."

I remember a beautiful male bred by Miss Armitage that she exhibited at one of the Manchester shows. "Sam Sly" was as near perfection as possible, and after taking everything in the way of prizes, medals, and championships this fine fellow came home and died! Mrs. Spencer, of Eye Vicarage, to whom I have alluded as a Siamese fancier, has bred so many large litters of kits that I wrote to ask if she would kindly give me and my readers the benefit of some of her experience in rearing young Siamese. She writes in reply:—

"My 'Royal Siam' came from the royal palace, and I consider him a splendid specimen. I did not breed from him until he was between three and four years old, which may be one of the reasons why all the kittens by him are so wonderfully strong and healthy. He has never ailed anything since I have had him. I have never placed him at stud, but have allowed a few friends to send their queens to visit him. Neither have I ever exhibited him, for he is far too precious a pet to be allowed to run any risks. My queen 'Princess Maimowne' is also a fine strong cat, a daughter of Mrs. Carew Cox's 'King Kesho'; and many are the prize-winners bred from these two. I heat my catteries during the day in winter, and at night in cold weather I give the cats a hot stone bottle in their sleeping boxes, for it is the damp and cold of our English winter nights which are so dangerous. The windows of my catteries face south, and this is important in rearing Siamese. I always allow my cats an abundance of fish; this I give—mixed with bread soaked in water—twice a day, with another meal of something different, thus making three meals a day. I boil all the milk. Sometimes I give a little cod-liver oil over their food—with very beneficial results. If the kittens have bad colds or any trifling ailment, I indulge them with a little finely cut up raw beef. I have been breeding Siamese for over five years, and I have only lost one kitten of my own rearing. I think the reason of my success is that I never pass over the most trifling symptom of illness, and it is very necessary to take the temperature of Siamese at the slightest sign of sickness. I send a great number of kittens away to purchasers, and I am most particular in the way I pack the kits for their journey. The basket outside should be covered with thick brown paper, leaving just a square piece in the lid for ventilation. Inside I line with new house flannel, and place a soft cushion at the bottom, and if very cold weather I put an indiarubber hot-water bottle under the cushion. If the cats have to pass through London, I arrange with the District Messengers Company to meet the cat and convey it to its destination or to another station. Thus dangerous delays are avoided at a very little cost."

As everyone knows, Lady Marcus Beresford has always been especially fond of Siamese cats, and many splendid specimens have inhabited the Bishopsgate cat cottage. At present "King of Siam" and "Khoula," and a quaint little female called "It," represent this breed. In the days gone by "Tachin" and "Cambodia" were the admired of all admirers, and I doubt if ever a more perfect pair has landed on these shores. These cats were given to Lady Marcus Beresford twelve years ago by the late Lord William Beresford, who brought them straight from the palace at Bangkok. Lady Marcus writes:—

"I never once had any trouble or anxiety with them—dear, gentle, friendly little people, so clever and attractive. I have never seen any I have so admired. They had many fine, healthy litters, scattered about now amongst various friends. My success all round was great with them—no illness of any kind, till one day a fiend poisoned both 'Tachin' and 'Cambodia,' and some of their six months kittens. I have replaced them with some bred in England; and my opinion is that, as a rule, the imported ones are much the stronger. A pair of Siamese imported from the temple at Bangkok I purchased from Mrs. Vary Campbell, and had the great misfortune to lose them. They differed from the royal Siamese, being darker and having a more pointed head and face, and their eyes were larger and fuller.

"I consider that Siamese cats are much cleverer than other breeds, and with patience can be taught several clever tricks. I intend to go in more largely for them in the future."

[Illustration:

MISS ARMITAGE'S "CORA."

(_Photo: Salmon & Batchan, New Bond Street, W._)]

Several of Lady Marcus Beresford's Siamese found their way into Mr. and Mrs. Hawkins' possession, and were exhibited from time to time, always gaining great distinction. Mrs. Hawkins possesses a daughter of "Tachin," and so hopes to keep up this unique strain. Mrs. Hawkins has some of the best arranged and very solidly built catteries at Brighton, of which I give an illustration. These are specially adapted for the breeding of Siamese and silvers, the two varieties which find favour at Shalimar. A long experience with Siamese enables Mrs. Hawkins to write with authority, and I give her notes as given to me for the benefit of my readers:—

“The first thing you have to consider with regard to these animals is that when newly imported they are naturally delicate, and must be hardened off, so to speak, just as our delicate foreign birds have to be; that is to say, you cannot treat them at first as you would our ordinary fireside cats. If you are fortunate enough to pick up newly imported ones, even if you have to pay a good price for them, they will prove a good investment; and perhaps you may be able to get some from one of our numerous cat fanciers, though they are very scarce at present and difficult to obtain. My advice is to get the best possible pair, and let them breed in the spring in the house, if you can let them have a spare room, which need not be warmed in any way. Leave the mother quietly with the kittens; and, having provided a warm bed and bedding for them previously, leave them to nature as much as possible, just going in now and then to see that all is going on all right, and giving the mother warm milk, etc., and coaxing her to get used to you.

“Siamese cats are particularly gentle and affectionate, and if you are kind to them they soon get to know and love you. It is a pity their nature is not more copied by human beings—then we should not have so much dissension and wrangling in our cat fancy. But this is a digression! As the kittens get on it is as well to have a warm place outside prepared ready for them; but do not put them out too soon, and if any show the slightest suspicion of cold they must be brought in and allowed to get over it completely before being turned out in the garden or outhouses, with the others.

“My own Siamese kittens were born in a cat house in my garden at Brighton, but they were June kittens, so by that time we were having very nice weather. The father and mother I had as kittens; I pulled them through their baby ailments successfully, and as soon as the weather was propitious and sunny I put them in their outside houses. Siamese and chinchilla kittens (both of which I go in for) must be hardened off gradually. They are just like English children brought from abroad, who have to be carefully nurtured at first and trained to get used to our English climate.

“What we want is to establish a really healthy, strong strain of Siamese in England, and by following the above suggestions I think it is possible to do it—not without difficulty, as, of course, it takes a little time and trouble (like everything else), but what is worth having is worth trying for.

“I may say I won with my Siamese at Brighton shows every time I exhibited them, and am now starting breeding them again; and I think that everyone who will have the patience to go in for this charming variety will find themselves well repaid, as the kittens command £5 to £10 each if successfully reared, and sometimes more. Of course, one must keep a careful watch over their diet, and not over-feed (this is a great point, as they will contract skin diseases if you do); but all these things apply as much to all cats, and I cannot see why Siamese should be more difficult to breed and establish thoroughly in England than other cats. One of mine, a female, is out now (and has been all the winter) in a brick cat house, and is perfectly well. I have been told Siamese are so delicate that people cannot rear them. This is often the fault of the people themselves, for if they will not take a little trouble over animals they cannot expect to make money by them. By this I do not mean fussing and worrying your servants over them. Look after them yourselves, see that they are all right every day (a good feed twice a day is quite sufficient), and then your Siamese will soon be as healthy and strong as your other cats. All the points of a good Siamese are so well known that I need not touch upon them here. Start with a good strain, be careful, be patient, and you will be rewarded in the end.”

[Illustration:

PAIR OF SIAMESE BELONGING TO MRS. ARMITAGE.

(_Photo: Salmon & Batchan, New Bond Street, W._)]

I have mentioned Mrs. Parker Brough as a breeder of Siamese cats, and I am indebted to her for the following account of her favourite breed:—

“A peculiarity of royal Siamese is that the kittens are born quite white, and at about fourteen days the points begin to look rather grey, turning at two months to a deep seal-brown, while the rest of the body usually remains white or cream for at least a couple of years (the whiskers and claws remain white). The colouring process resembles nothing so much as that of a meerschaum pipe. There are distinct varieties of Siamese known to fanciers—the palace or royal cat, the temple cat (chocolate), and there is likewise the common cat of the country, which is also found within the palace. The points of the chocolate cat are identical for shows with those of the royal except body colour, but the imported chocolate is often dark chocolate, with blue eyes, stumpy tail with a marked kink, short legs, and heavy, thick body. There are not many chocolates exhibited, owing to the preference given to the royal variety.

“It must be understood that there is no definite royal breed as such, but the palace breed seems to have originated by selection. The Siamese as a nation are lovers of anything quaint or uncommon, and the white-bodied cats in Bangkok seem to have been

given to, or bought by, the inhabitants of the palace, until they have established a breed of their own, and reproduced the cat that fanciers know to-day as the royal cat of Siam. This should explain a point which has given rise to much controversy, as travellers agree that other cats than royal Siamese are to be found inside the palace, yet the King and Prince Damurong have given from time to time royal Siamese to friends, naturally choosing for a present the cat that has the most value in their eyes. That is to say, that the term ‘royal Siamese’ or ‘royal cat of Siam’ is a descriptive term applied to a particular variety of cat, and should imply no more than this. We have a parallel case in ‘King Charles spaniels.’ The temple cat is under the care of the Jan priests, who have the greatest reverence for animal life, and whose temple is a sanctuary for all animals.

“Those who have kept Siamese will readily understand that, given a climate to suit them, only one breed of cat would be left in the temple—_i.e._ the Siamese, for this breed is distinguished as much by its pluck and activity as by hatred for any other breed of cat. The common cat of Siam is very much the same as anywhere else, except that the Malay kink in the tail is to be found in many of them. Until recently the Siamese was but little known in Europe, but occasionally was to be found in the various zoological gardens. At present there is a fine female specimen to be seen at the Zoo at Frankfort-on-the-Main, having been purchased from the King of Roumania. One or two are to be seen at Berlin, and we understand some are to be seen at the Hague. London has the first one it has had for six years, but it is not shown owing to its want of condition.

“A point on which the Siamese fancy is divided is whether the ideal cat should have a kink in the tail or not. The Club remains neutral. ‘Champion Wankee’ has a decided kink, looking, in fact, as though the tail had been caught in a door in his early youth. ‘Tiam-o-Shian IV.,’ on the contrary, has none. This kink is a peculiarity of the animals of the Malay Peninsula, and sometimes is so marked, as to make the tail appear like a corkscrew, though others of the same litter may have quite straight tails. There is a peculiarity in breeding Siamese—_i.e._ the rarity of female kittens in a litter, the average seeming to be five males to two females. This may be due to the artificial lives so often led by these cats; and, if so, corroborates the theory of Herr Schenk, the Austrian doctor, of the probabilities of sex at birth. Three of the most noted male cats exhibited in England have been Mrs. Robinson’s ‘Champion Wankee,’ Mrs. Vyvyan’s ‘Tiam-o-Shian IV.,’ and Mrs. Parker Brough’s ‘Koschka.’ Probably Mrs. Backhouse’s ‘Champion Eve’ and Mrs. Vyvyan’s ‘Polyphema’ were the best females exhibited. ‘Koschka’ was, perhaps, the finest cat we ever saw, having eyes of the most glorious blue imaginable. ‘Koschka’ died after the Westminster show of 1900. Owners run a great risk in sending their Siamese (especially kittens) to shows, as in addition to being more liable to take cold, are apt to fret themselves ill at being separated from their mistresses. Many fanciers are leaving off showing Siamese for that reason—for instance, the Siamese classes were cancelled at the Westminster show of 1903 owing to lack of entries.

“It is hard to say how they should be kept and how they should be fed. Some Siamese thrive by being treated just the same as ordinary cats, but they are few and far between. We have known cats which have been allowed to run about in the snow, and in and out of draughts, and remain perfectly healthy; and others, who seem quite strong as long as they are taken care of, catch cold and die if they get their feet wet. However, if their cattery is kept constantly at a temperature of 50 degrees, and they are fed on scraped beef, milk (without boracic acid or preservative), water, and vegetables they seem to do better than under any other conditions. Personally, we have two catteries—indoor and outdoor. The indoor one is fitted up with ‘foster mothers,’ as used for chickens, on legs about three feet from the ground. We find this very necessary owing to the draughts on the floor. The rooms can be quickly warmed to any temperature required, even in the depth of winter. We like our grown-up cats loose about the house, but it is impossible to allow kittens their full liberty when there are many of them, as they are bound to get into mischief and do much damage to the furniture, climbing up curtains and breaking ornaments on mantelpieces and scratching leather, etc. Of course, they are allowed downstairs a portion of every day when their mistress is able to look after them. They are most fascinating, frolicsome little creatures. The outdoor catteries—for use in summer—consist of a house and greenhouse, with covered runs leading from them, and so arranged that any or every cat can be isolated at will. These arrangements have taken a great deal of anxiety off our shoulders.

“This breed is certainly the noisiest, least dignified, most intelligent, and most active of all the cats. They are doglike in their nature, and can be easily taught to turn back somersaults, and to retrieve, and in the country take long walks like a terrier.

[Illustration:

MRS. ROBINSON’S “AH CHOO.”

BRED BY MRS. VYVYAN. (_Photo: E. Landor, Ealing._)]

“If they think it is meal-time and they fancy themselves neglected, they cry like children. The points of the perfect royal Siamese lie in the eyes, which should be a most perfect blue, and the contrast between the seal-brown of the paws, mask, and tail and the white or cream of the rest of the body, which should _not_ be disfigured by bars or blotches. Age should be taken into consideration in judging this contrast. There are many beautiful kittens shown that we never hear of again after they have grown up, age having blurred their coats, thereby making the contrast less defined.

[Illustration:

MRS. ROBINSON’S “CHAMPION WANKEE.”

(_Photo: E. Landor, Ealing._)]

“For travelling short distances there are few better travelling cases than a Canadian cheese box, with holes bored in the side. They are cheap (say 4d.), light, and damp and draught proof, and can be burnt after once using.”

It will be gathered from the accounts given by Siamese fanciers that these cats, though delicate, with the exercise of care may be reared like ordinary ones of other breeds. Miss Cochran is very emphatic on this point. She says:—

“If Siamese are treated like common English cats, given plenty of fresh air and proper food, they are hardy and healthy; and by proper food I mean a meat diet—raw shin of beef, and as often as possible any kind of bird with the feathers on, or fowls’ heads and mice. The fur and feathers act as a mechanical vermifuge. If the Siamese cats are coddled, they will certainly die. They have naturally rather delicate lungs, and for these fresh air is absolutely necessary; a close, hot atmosphere and heated rooms are fatal.”

[Illustration:

“MAFEKING.”

THE PROPERTY OF MRS. VYVYAN. (_Photo: E. Landor, Ealing._)]

Mrs. Carew Cox I have alluded to as one of the pioneers of the Siamese fancy, and she still remains an ardent admirer of this breed, and often acts as judge. She has kindly written a very valuable article specially for this work, and I have therefore great pleasure in giving her interesting experience in this chapter on Siamese:—

“Only those who possess Siamese can understand how reluctantly a lover of this breed takes up a pen to endeavour to do justice to its characteristics—it is like attempting the impossible. One feels one must step softly—so to speak—in the presence of these wonderfully fascinating creatures, whose thoughtful yet penetrating eyes appear to see so far and so much, whose intelligence seems almost human, and who seldom stay with us for long. Unfortunately, these cats are difficult to rear, the constant damp of our climate affecting their lungs and producing frequent colds and coughs, lowering vitality and causing debility.

“There are two recognised varieties of this breed—the royal and the chocolate. The former is certainly the most beautiful in appearance, the seal-brown points—sometimes black in adults—relieving the pale but rich cream colour of the rest of the body, and the brown mask forming a grand setting for the superbly blue eyes. The mask on the face should circle well above the eyes, but should not extend into the ear space; the cream colour should be in evidence beyond the circle; the ears should be seal and well and distinctly put on—_i.e._ the seal or brown should not merge into the cream; the legs, feet, and tail should be of the same shade of seal, the darker the better. The tail of a Siamese cat has been the subject of considerable discussion and argument, some preferring the straight tail and some the kinked. The former is surely the most to be desired for appearance sake; but the latter undeniably adds to the quaint and foreign appearance of the cat, and in Hong-Kong preference is given to them and higher prices paid for ‘kinks.’ The eyes should be large and luminous, of a bright shade of true blue, appearing flame-coloured at night or by artificial light; good specimens are often spoilt by small eyes, pale in colour. There appear to be two distinct types—the compactly built, short in body, short on legs, and round in head; and the long-bodied, long-faced, lithe, sinuous, and peculiarly foreign-looking variety. I am informed that the small cats are held in great esteem in Siam, some of the females being quite liliputian. It is a matter for regret that as the cat ages the beautiful clear cream colouring becomes cloudy and dark. There have been exceptions to this rule: the late ‘Polyphema,’ owned by Mrs. Vyvyan, retained her pale colouring and her well defined points to the last, and was the mother of many very beautiful kittens. Male cats are generally larger than females, and possess voices, which demand instant attention.

[Illustration:

THE LATE “KING KESHO.”

(_Photo: Phillips, Croydon._)]

“The chocolate Siamese are of a rich chocolate or dark seal, with still more intense points. These cats usually possess eyes of rich amber. I have Miss Forestier-Walker’s kind permission to utilise the following most interesting—and hitherto unpublished—extract from a letter received by her in October, 1902:—‘I am very pleased to write and give you the following information _re_ Siamese cats. During a stay of some thirteen years in the Straits Settlements I have visited Siam on several occasions, and on one of these visits the present King of Siam gave a friend of mine a pair of cats. These cats were what the King called palace cats, were very valuable and perfect specimens, with short twisted tails. It may also interest you to know that the Siamese have a superstition about their cats, and like to have both breeds in their houses—_i.e._ the dark, coffee-coloured ones with yellow or golden-coloured eyes, and the cream-coloured with blue or silver eyes. The idea is that the yellow-eyed cats will bring gold and the blue-eyed silver, hence if you have both breeds there will always be plenty in the house.’

[Illustration:

LADY MARCUS BERESFORD’S “CAMBODIA.”

(_Photo: E. Landor, Ealing._)]

“I advocate that all kittens should be reared by healthy English foster-mothers, and am convinced that if breeders would adopt this plan we should in time succeed in establishing a far stronger breed of cats. As matters now stand, the kittens inherit and develop any ailment or weakness to which their mothers may be subject, so that from the very commencement of their existence they have but little chance of becoming strong and healthy enough to withstand our climate of many moods.

“Plenty of sun and air they require, but damp and draughts are fatal. All young kittens should be encouraged to take exercise; empty cotton reels cause hours of amusement, also a rabbit’s foot tied on to string or otherwise; corks of any description must be avoided. Large bones should be given when the kittens are two months old—they assist the growth of teeth; small ones, such as of game, chicken, or fish, are dangerous. The best and safest of all is a bullock’s foot boiled down and pulled apart; these bones will occupy kittens for a considerable time.

“Worms cause an enormous mortality amongst Siamese, and are, I feel convinced, at the root of nearly every ailment from which cats or kittens suffer; therefore, however reluctant one may feel as to giving medicine to youngsters of tender age, it is better to do this than to run the risk of these odious parasites establishing themselves, for they are most difficult to dislodge permanently. I have used Saunder’s worm powders with considerable success. Of course, the dose for kittens must be administered in minute quantity—just a small pinch given in warm olive oil early in the morning after an all-night fast. In giving the powder to adults I always enclose it in capsules. In cases of weakness or exhaustion a few drops of brandy or whisky in a teaspoonful of warm milk works wonders. It is often necessary to give some sort of tonic after medicine of this description.

“Siamese kittens should be well fed; not much at a time, but little and often—lean scraped beef or mutton, vegetables, stale bread and gravy, boiled fish, rabbit, raw eggs, milk (previously boiled); in fact, anything light and nourishing. The remains of a meal should never be left on the floor. These kittens’ digestions are not strong, and their intestines are most delicately formed.

“The colour of the eyes of Siamese kittens should be well determined at eight weeks. They are most interesting and playful at this age; a tunnel made of newspapers will afford endless amusement, and after a long and energetic game of play they will sleep for hours. It is not desirable to lift or handle them more than can be avoided whilst they are very young. In cases of bad colds or coughs, a simple but usually effective remedy is a mixture of three pennyworth of oil of almonds and three pennyworth of syrup of violets, mixed by a chemist—a quarter of a teaspoonful thrice daily (it is absolutely necessary to shake the bottle thoroughly before administering the medicine). For an adult an eggspoonful three times daily may be given. Cod-liver oil is always safe (also the best olive oil), and helps to build up the constitution. As a tonic I know of nothing to equal half-grain (coated) quinine pills, given early each morning for a few days now and again. In cases of bronchitis, Carvill’s Air Purifier (about a teaspoonful) should be placed in boiling water, and the cat or kitten made to inhale the steam several times daily, and particularly the first thing in the morning and the last at night.

[Illustration:

PUGS PAYING A VISIT TO THE SIAMESE.]

“For adults suffering from bad throat complaint and total refusal of all food I have found no remedy to equal the following prescription, if given in time. I have administered it with great success to numberless cats: Forty drops Calvert’s pure carbolic acid, two drachms spirits of wine, six ounces pure water. Not quite half a teaspoonful to be mixed with a teaspoonful of warm milk, poured down the throat three times daily; for very young cats a smaller quantity of the mixture should be given. I doubt if it would be advisable to give it to young kittens. Even if the cat does not swallow the whole dose, it acts beneficially as a mouth-wash and disinfectant, apparently removing an unpleasant taste and re-establishing the power to smell—the loss of this sense often preventing a sick cat from eating. Weak eyes, sickness, and diarrhœa are tedious ailments to which all kittens are very subject, and to effect a permanent cure the treatment must be very persistent.

THE

STORY OF THE SEWING MACHINE.

CHAPTER I. THE SEWING MACHINE'S RIVALS.

"With fingers weary and worn, With eyelids heavy and red, A woman sat, in unwomanly rags, Plying her needle and thread— Stitch! stitch! stitch! In poverty, hunger and dirt, And still, with a voice of dolorous pitch— Would that its tone could reach the Rich!— She sang the 'Song of the Shirt.'"

[Illustration:

THE SONG OF THE SHIRT.]

In a back street of Boston two men sat one sultry August midnight upon a pile of boards. They were penniless and friendless; they were smarting under failure and keen and bitter disappointment. Actual want stared them in the face and made them desperate. And yet, upon the outcome of that midnight scene mighty issues hung quivering. All the world had a stake in the thoughts of those poor, friendless, desperate men. One of them had heard from across the seas the "Song of the Shirt;" he had heard its sad echo even from the more prosperous homes of our own land, and its dismal chords had awakened in his breast a burning desire to still its horrible refrain, and carry relief and help to the weary seamstress. Golden visions, too, had floated before him of the princely reward the world would offer for such service to its great sisterhood.

With great difficulty he had persuaded two other men to join him. One furnished the scanty capital of _forty dollars_; the other gave the use of his machine shop, workmen and tools. Day and night he had worked to produce a SEWING MACHINE, sleeping but three or four hours out of the twenty-four, and eating, generally, but once a day, as he knew the machine must be built for forty dollars or not be built at all. The hour of trial had come that very day. The machine had been completed and put together, and _did not work_! One by one the workmen left him in disgust, but still the inventor clung tenaciously to his purpose, and refused to yield to defeat. All were gone but this companion, who held the lamp while the inventor worked. Loss of sleep, insufficient food, and incessant work and anxiety made him weak and nervous, and he could not get tight stitches. Sick at heart, the task was abandoned at last, and at midnight the worn and wearied men turned their backs upon their golden dreams and started for their lodgings. On their way they sat down upon the pile of boards, and were gloomily discussing the sad fate of the project, when his companion mentioned to the inventor that "the loose loops of thread were all upon the upper side of the cloth." Instantly it flashed upon the inventor what the trouble was, and back through the night the men trudged to the shop, re-lighted the lamp, tightened a little tension screw, and in a few minutes ISAAC MERRITT SINGER had produced the first Sewing Machine that ever was practically successful.

[Illustration:

THE CRITICAL MOMENT.]

It _was_ a great stake which the world had in the gloomy midnight reflections of two desperately poor men, seated upon that pile of boards, thirty years ago! Rarely has so much hung upon the thoughts of two humble men. That midnight scene settled the question whether woman should have a tireless helper in her weary task of stitching—whether or not the world should thenceforward have a machine for sewing. Out of that lumber-pile conference came the Sewing Machine and all the mighty interests involved in its manufacture, sale, and use. It was the answer to the “Song of the Shirt;” its dolorous tone had reached—not the rich—but a poor, struggling mechanic; and his invention has done for woman and for the home-circle what no other invention ever has done. We look back upon James Watt, sitting before the open fireplace, watching the pot lid rise and fall with the then undiscovered power of steam, as the scene whence issued all the blessings which followed the Steam-engine. We think of Franklin flying his storm-riding kite and drawing down the lightning, as thereby bringing to us all the civilizing influences of the Telegraph. But neither of these men, if they could have looked down the dim vista of the coming centuries, and foreseen what their inventions should do for humanity, could have contemplated results more surprising than those which Isaac Merritt Singer lived to see crowning the invention which hung trembling upon the results of that talk upon that pile of boards!

The Telegraph and Steam-engine live daily in the broad blaze of public view; the Sewing Machine modestly hides itself away beneath three million of the nine million roofs of America. They are public blessings; the Sewing Machine is a purely domestic one. It earns a woman’s dime; they earn a railroad king’s millions. They deal with the great arteries of trade and commerce; it deals with the fireside circle. The Telegraph and Steam-engine proudly boast their alliance and familiarity with Capital; the Sewing Machine contentedly takes up its humble quarters mainly with people who never drew a dividend in all their lives. Capital and wealth must run the former; slender and humble feet most often run the latter. The Locomotive puffs defiantly in nearly every legislative hall; the Sewing Machine sings its tireless tune to ears that would not know what “_lobby_” meant. The former haughtily issues its dictum to primaries and conventions; the latter could not control a solitary vote. Steam and the Telegraph deal mainly with creation’s lord; the Sewing Machine with his lowlier sister.

A certain class of people are apt to underrate domestic affairs, simply because they are domestic, forgetting that the real progress of the world is always made beneath the shelter of the homestead roof, not under the resounding domes of Senate Chambers; and that a Nation’s surest hope for greatness and for safety is found in the character of its _homes_, rather than in the shrewdness of its merchants or the skill of its artisans. It is the atmosphere of the boy’s early home which clings like an indestructible and exhaustless aroma to his entire life; it is the influence and memory of what his home and his mother were which mould his after life, control his habits of thought, and make him a power for good or for evil in the world. And for the most part he remains unconscious of any such influence. He has imbibed it with his daily sustenance and inhaled it with every breath of his native air, until he involuntarily weighs everything, measures all affairs, and judges all men according to the standards and traditions that prevailed in the now hallowed precincts of his early home.

Whatever, therefore, brings added comfort to the matron and the maiden; whatever saves the busy housewife’s time and increases her opportunities for culture; whatever lifts any of the heavy household burdens, and disenthralls to any degree the WOMEN of our day, contributes an ever-augmenting influence towards the highest and best progress of the world.

[Illustration:

“HAPPY HOMES”—EFFECTS OF THE ANSWER.]

And so the importance of the Sewing Machine in its influence upon the home; in the countless hours it has added to woman’s leisure for rest and refinement; in the increase of time and opportunity for that early training of children, for lack of which so many pitiful wrecks are strewed along the shores of life; in the numberless avenues it has opened for female labor; and in the comforts it has brought within the reach of all, which once could be attained only by the wealthy few, becomes so apparent that few, if any, will dispute its right to stand at least beside its powerful rivals, the Steam-engine and Telegraph.

CHAPTER II. GROWTH OF THE IDEA.

The idea of sewing by machinery had been cherished for a hundred years before the first successful machine was built.

The earliest attempt at sewing by machinery of which any authentic account exists was made as early as July 24th, 1755, when a machine was patented in England by Charles F. Weisenthal, having a needle with two points and an eye at mid-length.

The next sewing machine was that of Thomas Saint, of England, who obtained a patent July 17, 1790. This man seems to have understood, with remarkable clearness, the main essential features of the invention, for his machine had a horizontal cloth-plate, an overhanging arm, at the end of which was a needle working vertically, and a “feed” working automatically between the stitches. These features have been preserved in every successful machine ever made. The needle was notched at the lower end, to push the thread through the goods, which had been previously punctured by an awl. As the needle passed upwards, leaving a loop in the thread, a loop-check caught the loop and held it until the needle descended again, enchaining the thread of the new loop in the former one.

In 1804 an Englishman, named Duncan, made a chain-stitch machine, having a number of hooked needles, which passed through the cloth and were supplied with thread beneath the goods by a feeding needle, whereupon the needles receded, each drawing a loop through the loop previously drawn by itself through the cloth.

In 1818 Rev. John A. Dodge, of Monkton, Vt., invented, and, with the assistance of John Knowles, an ingenious mechanic, constructed a machine having the double-pointed needle and eye at mid-length. It made a stitch identical with the ordinary “back-stitch,” and was furnished with an automatic device for “feeding” the work. Mr. Dodge never applied for a patent, nor attempted to manufacture any more machines, because of the great pressure upon his time as a pastor, and further on account of the bitter opposition of journeymen tailors, who denounced the machine as an invasion of their rights.

The first patent issued in America for a sewing machine was that of a man named Lye, in the year 1826. Lye’s device could hardly have contained any useful or striking features, for when the fire of 1836 destroyed all the Patent Office Records, it consumed all that remained of this machine.

In the year 1830 Barthlemy Thimmonnier, a Parisian, invented a machine which operated much as Saint’s did, except that the needle was crocheted, and, descending through the goods, pulled up a lower thread and formed a series of loops upon the upper side of the goods. Eighty of these machines, made of wood, are said to have been used at one time in Paris, making army clothing; but though patented in France in August, 1848, and in the United States September 3, 1850, it had too many defects to become anything more than an important step in the onward march of this great invention.

[Illustration:

BIRD’S EYE VIEW OF THE GREAT SINGER FACTORY.]

Many other machines, of more or less merit, were constructed before Mr. Singer made his machine, but all fell short of being practical and useful. The nearest approach to success prior to 1850 was made by Walter Hunt, of New York City, in the years 1832–3–4. His machine had a curved needle, with an eye near the needle-point, which was operated on the end of a vibrating arm. A loop was formed beneath the cloth by the needle-thread, through which a shuttle, reeling off another thread, was forced back and forth with each stitch, making an interlocked stitch like that now made by the best machines. George A. Arrowsmith, a blacksmith, of Woodbridge, N. J., being of a speculative turn, bought one-half of Walter Hunt’s invention in 1834, and afterwards acquired the remainder. Soon afterwards, Adoniram F. Hunt, a brother of Walter, was employed by Arrowsmith to construct some sewing machines upon the same principle, but differing somewhat in arrangement of details from the original. These machines were made and operated at a machine shop in Amos Street, New York City. Arrowsmith neglected to obtain a patent upon the machine for reasons which, in the light of events now past, make singularly interesting reading. He assigned three reasons for not procuring a patent: (1) He had other business; (2) the expense of patenting; (3) the supposed difficulty of introducing them into use, saying, it “would have cost two or three thousand dollars to start the business.” There appeared also a prejudice against any machine which had a tendency to dispense with female labor. A proposition made by Walter Hunt to his daughter to engage in the corset-making business with a sewing machine was declined, after consultation with her female friends, principally, if not altogether, as she afterwards testified, “on the ground that the introduction of such a machine into use would be injurious to the interests of hand-sewers. I found that the machine would at that time be very unpopular, and, therefore, refused to use it.”

The neglect of Hunt and Arrowsmith to procure a patent upon this sewing machine was fraught with momentous consequences a few years later, not only to them but to the entire sewing machine trade and the world at large.

John J. Greenough, on February 21, 1842, procured the first sewing machine patent in America of which any official record now exists. His machine sewed with two threads, both of which were entirely passed through the cloth at every stitch, the needles being pulled by pincers through holes previously bored with an awl. It was designed principally for leather work.

R. W. Bean, of New York City, patented a machine, March 4, 1843, for making a “running” or basting stitch.

Another machine, having two threads and generally like Greenough’s, was patented December 27, 1843, by George R. Corliss, of Greenwich, N. Y. It had eye-pointed needles reciprocated in horizontal paths, through holes previously made by awls, the goods being fastened between clamps and fed in front of the needles.

[Illustration: [Furnace]]

Another form of sewing machine, of which several varieties were patented between 1844 and 1850, adopted the somewhat primitive method of first crimping the cloth and then forcing it upon the needle, which was driven through a number of thicknesses at the same time, making a running stitch.

In the year 1846, or over twelve years after Walter Hunt’s machine was built, Elias Howe, Jr., having probably ascertained that Hunt had never patented his machine, built a sewing machine upon the Hunt plan, adding two puerile devices (both of which were subsequently abandoned as useless), and procured a patent thereon in his own name. These devices were a “clipping piece” to control the unwinding of the shuttle-thread, and a “baster-plate,” to which the work was basted, and thus hung vertically in front of the machine. This machine never became of real utility until the inventions of Mr. Singer, five years later, had been added to the principles of action applied originally by Hunt and appropriated by Howe. After Singer’s inventions had been recognized as giving to the sewing machine a practical and immense value, Walter Hunt testified, under oath, as follows: “ELIAS HOWE _has several times stated to me that he was satisfied that I was the first inventor of the machine for sewing a seam by means of the eye-pointed needle, the shuttle and two threads, but said that he had the prior right to the invention because of my delay in applying for letters-patent._” In the year 1853, Hunt applied for a patent upon his invention, but was refused upon the ground of abandonment.

Judge Charles Mason, Commissioner of Patents, in delivering his decision in May, 1854, upon the evidence in Hunt’s application, used the following language: “Hunt claims priority upon the ground that he invented the Sewing Machine previous to the invention of Howe. He _proves_ that in 1834 or 1835 he contrived a machine by which he actually effected his purpose of sewing cloth with considerable success. Upon a careful consideration of the testimony, I am disposed to think that he had then carried his invention to the point of patentability. I understand from the evidence that HUNT actually made a working machine in 1834 or 1835. The papers in this case show that _Howe_ obtained a patent for substantially _this same invention_ in 1846.”

Notwithstanding this, the Commissioner was forced to refuse Hunt’s belated application, for the reason that an Act of Congress in 1839 had provided that inventors could not pursue their claims to priority in patents unless application was made within two years from the date when the first sale of the invention was made. Hunt had sold a machine in 1834, and had neglected to make application for his patent till 1853.

[Illustration:

THE SINGER COMPANY’S STEAMER, “EDWARD CLARK.”]

Thus it was that one of the grandest opportunities of the century was missed by the man who should rightfully have enjoyed it; the honors and emoluments of the great sewing machine invention passed to a man who neither had invented a single principle of action, nor applied a practical improvement to principles already recognized; and Elias Howe, Jr., acquired the power, by simply patenting another man’s invention, to obstruct every subsequent inventor, and finally to dictate the terms which gave rise to the great Sewing Machine Combination about which the world has heard—and scolded—so much.

Howe’s machine was not, even in 1851, of practical utility. From 1846 to 1851 he had the field to himself, but the invention lay dormant in his hands. He held control of the cardinal principles upon which the coming machine must needs be built, and planted himself squarely across the path of improvement—an obstructionist, not an inventor—and when, in 1851, Isaac M. Singer perfected the improvements necessary to make Hunt’s principles of real utility, Howe, after long and expensive litigation, laid Singer and all subsequent improvers under heavy contribution for using the principles of Hunt, patented by himself.

Morey & Johnson procured a patent February 6, 1849, for a single-thread machine, making a stitch by a hook acting in combination with a needle.

Lerow & Blodgett patented a machine October 2, 1849, the peculiar feature of which was that the shuttle was driven entirely around a circle at each stitch. This took a twist out of the thread at every revolution, and was soon abandoned, but not before Howe had sued the proprietors and laid them under tribute.

Allen B. Wilson invented a double-pointed shuttle, making a stitch at each passage of the shuttle, which he patented November 12, 1850.

Grover & Baker, February 11, 1851, obtained a patent for a machine using two needles, one passing through the goods and the other operating beneath the cloth.

[Illustration:

THE OLD AND THE NEW.]

Other patents, of more or less value, were obtained, but not yet had a sewing machine of any practical working value been produced. Machines had been made by hundreds, factories had been built for their manufacture, territorial rights had been sold for machines that contained more or less merit, but which would not and could not do continuous stitching. The idea of a successful substitute for woman's deft fingers at sewing had come to be regarded much as the member of Parliament viewed the project of an ocean steamship, when he offered to "_eat_ the first ship that should cross the Atlantic by steam!" The sewing machine had bitterly disappointed those who purchased it for use in the household; it had bankrupted those who sought to manufacture; it had turned to ashes upon the lips of those who bought territorial rights. If any one had profited by it, it was the vendor of territorial rights. Indeed, a sewing machine patentee named Blodgett told Singer he was an idiot for presuming to make sewing machines to _sell_. They would not work, and the only money to be made out of the business was in "selling territorial rights." Deep-seated distrust pervaded the public mind, and well-deserved odium had settled upon the entire invention. Such was the state of affairs when Isaac M. Singer turned his versatile mind towards the Sewing Machine.

CHAPTER III. THE FIRST SINGER MACHINE.

The humble origin of the first practically successful sewing machine was told by Mr. Singer himself a few years before his death. We reproduce the interesting narrative in his own language:

"My attention was first directed to sewing machines late in August, 1850. I then saw in Boston some Blodgett sewing machines, which Mr. Orson C. Phelps was employed to keep in running order. I had then patented a carving machine, and Phelps, I think, suggested that if I could make the sewing machine practical I should make money.

"Considering the matter over night, I became satisfied I could make them practically applicable to all kinds of work, and the next day showed Phelps and George B. Zeiber a rough sketch of the machine I proposed to build. It contained a table to support the cloth horizontally, instead of a feed-bar from which it was suspended vertically in the Blodgett machine, a vertical presser-foot to hold the cloth, and an arm to hold the presser-foot and needle bar over the table.

"I explained to them how the work was to be fed over the table and under the presser-foot, by a wheel having short pins on its periphery, projecting through a slot in the table, so that the work would be automatically caught, fed, and freed from the pins, in place of attaching and detaching the work to and from the baster-plate by hand, as was necessary in the Blodgett machine.

"Phelps and Zieber were satisfied that it would work. I had no money. Zieber offered forty dollars to build a model machine. Phelps offered his best endeavors to carry out my plan and make the model in his shop. If successful we were to share equally. I worked at it day and night, sleeping but three or four hours out of the twenty-four, and eating generally but once a day, as I knew I must make it for the forty dollars, or not get it at all.

"The machine was completed in eleven days. About nine o'clock in the evening we got the parts together, and tried it. It did not sew. The workmen, exhausted with almost unremitting work, pronounced it a failure, and left me one by one.

[Illustration:

DESERTED BUT DETERMINED.]

"Zieber held the lamp, and I continued to try the machine; but anxiety and incessant work had made me nervous, and I could not get tight stitches. Sick at heart, about midnight we started for our hotel. On the way we sat down on a pile of boards, and Zieber mentioned that the loose loops of thread were on the upper side of the cloth. It flashed upon me that we had forgotten to adjust the tension on the needle-thread. We went back, adjusted the tension, tried the machine, sewed five stitches perfectly, and the thread

snapped. But that was enough."

Persistent efforts have been made by interested parties to create an impression upon the public mind that it was Mr. Howe who first evolved order out of the chaotic essentials of the sewing machine and brought it into practical use. Of this let the reader judge for himself, after comparing the features of each machine set forth below. Let him note the features that are still preserved in every successful sewing machine and those which have been abandoned as practically worthless, and he will find little difficulty in settling for himself the merits of the respective claims of Howe and Singer.

The tests of time and actual service have been applied to the original features of both machines, and these, at least, know no favoritism. It matters not in these tests how broad or loud is the claim of any man; history may be blinded for a time, but the "survival of the fittest" is the inexorable law in useful inventions.

None of the devices used by the man who claims to have "invented the sewing machine" can be found in any successful shuttle machine to-day. Thirty years of actual service have swept away every vestige of Howe's original machine except the eye-pointed needle, invented twelve years before by Walter Hunt, and used by both Singer and Howe. Meanwhile every feature of Singer's original machine has been adopted by every successful machine builder of the class to which these machines belonged, with the single and unimportant exception of the adjustable arm; and in nearly every case when a device of Howe's has been found worthless, and been abandoned, it was Singer's device which was substituted, as the foregoing table explicitly shows. In the clear light of such facts it is not difficult to understand to whom the world is really indebted for the inestimable boon of the sewing machine.

CHAPTER IV. GREAT OAKS FROM LITTLE ACORNS.

Starting with a capital of _forty dollars_, and that borrowed from another man, this poor mechanic launched upon the stormy sea of commercial life. Discouragements and disappointments met him at every turn. People had learned to look upon the Sewing Machine very much as we look upon the "Keely Motor." Every man who pretended to have a working machine was considered an impostor. Thousands had bought machines on the faith of inventors' statements, which they were obliged to throw aside as useless. Whoever now attempted to introduce the Sewing Machine must face all the consequences of previous failures, and this Mr. Singer quickly learned to his sorrow. Everywhere he found people unwilling to believe that a successful sewing machine had actually been built, and repeatedly he was shown to the door the moment he had stated his business.

Mr. Blodgett advised him to give up manufacturing, and sell territorial rights. He said he was a tailor by trade and knew more about sewing than Singer possibly could; that the Blodgett machine had been the leading machine in the market, and he could rest assured that "sewing machines would never come into use."

Still the undaunted mechanic struggled on in poverty, bearing up under reverses and disappointments, resolved to _force_ an unwilling public to recognize the fact that a successful sewing machine could and actually had been made. Slowly he gained ground; gradually he obtained access to the public ear; by degrees he induced people to at least give his machines a test. A few hundred dollars borrowed from friends expedited the work of introduction, and just as the skies seemed to brighten, a new and formidable trouble appeared. The news that Singer had made a machine which would actually do continuous stitching brought Elias Howe, Jr., to his door with the patent he had obtained upon another man's invention (as before stated), who claimed that Singer infringed his patent, and must pay him the modest sum of $25,000 or quit the business. It did not take long for a man who had recently borrowed forty dollars to begin business, to decline paying twenty-five thousand dollars tribute-money, and the consequence was that Singer found himself burdened with litigation that threatened to swamp him.

[Illustration:

YARD OF THE GREAT SINGER FACTORY.]

At this juncture he called in the aid of Mr. Edward Clark, whose recognized legal and financial skill were taxed to the utmost to prevent the utter ruin of the inventor. Mr. Clark became an equal partner, and business was thenceforward conducted under the firm name of "I. M. Singer & Co."

Other inventors were stimulated by Singer's success to vigorous efforts at making machines of practical utility, and the consequence was a series of infringements upon existing patents, resulting in a perfect epidemic of litigation. Principal among the litigants was Elias Howe, Jr., whose patent enabled him to bring all the rest under contribution, and this he did, sueing right and left for several years. The patent of 1846 had made Howe complete master of the situation, and enabled him to dictate the formation of a combination, by the terms of which licenses were issued to manufacturers upon the payment of a heavy royalty for each machine manufactured. From this royalty Howe received the monstrous stipend of over two millions of dollars, not because he had invented anything useful to the world, but simply because he had obtained a patent upon the inventions of another man!

From the outset, Singer & Co. resisted, at great expense, the demands and pretensions of Howe, fighting single-handed the battle of the inventors and the great world which was waiting for cheap machines. Howe was endeavoring to establish a monopoly, strong and compact, which meant dear machines to the weary-fingered women who were still singing the dreary "Song of the Shirt;" Singer & Co. were struggling to throw the business open to fair and honest competition at moderate prices. For three years the unequal contest was continued against the monopoly. All the other manufacturers had yielded to Howe at the first, and were conducting their business without interruption under his licenses. They viewed the contest between Howe and Singer & Co. much as the traditional frontiersman's wife regarded a terrible struggle between her husband and a grizzly, merely remarking that "it didn't make much odds to her which won, but she allers loved to see a right lively fight." If Singer & Co. won, all the others would reap the full benefit of the victory without cost to themselves; if Howe should win, they would be no worse off than they were before, and he would probably cripple their most formidable competitor. Meanwhile the business of Singer & Co. was suffering every possible obstruction, while that of their competitors, now wholly uninterrupted, was making great strides.

[Illustration:

SCREW DEPARTMENT.]

At last, in May, 1854, self-preservation dictated a withdrawal from such a contest, and an agreement was made by which Singer & Co. were to pay Howe a royalty upon each machine manufactured by them. Thus was taken the last and most important step towards the great Sewing Machine Combination, into which Singer & Co. were the last to enter, and then only when driven into it for self-preservation, after a long and exhaustive drain upon their means. In settlement of this suit, Howe received $15,000 royalty, and the total sum paid to Howe by Mr. Singer and his associates, up to 1877, was over a quarter of a million dollars.

By the year 1863, the annual sales of Singer machines amounted to 21,000, and agencies were established in the principal cities of the United States. In that year the firm was merged into an incorporated company, bearing the title of "The Singer Manufacturing Company," and both the original partners retired from the active management of the business, though they remained the heaviest stockholders, and had seats in the Board of Directors.

In four years' time the yearly sale of machines had more than doubled. In two years more even this large figure had been doubled. Two years more and the annual sales had again doubled, the sales of that year (1871), amounting to 181,260 machines. In seven years more even this amount of business was doubled, the number of Singer machines sold in the year 1878 being 356,432. It

would seem as if the extreme limit of business must now have been reached. But still the yearly sale increased, and, in the single year, 1879, the world bought the immense number of 431,167 Singer Sewing Machines, and, at the time of writing, it appears as though even this figure might be surpassed for the year 1880. Three-fourths of all the sewing machines sold throughout the world in 1879 were “Singers.”

Perhaps no company ever before was officered as the Singer Manufacturing Company was at its organization in 1863. The business had been originally started by a penniless man upon a borrowed capital of forty dollars, and had brought to him and his partner a golden harvest. Both were now rich, and in stepping out they placed the control of the new Company in the hands of men who had risen to notice solely by their own merits and exertions. The new President, Mr. Inslee A. Hopper, had been an entry clerk with I. M. Singer & Co.; the Vice-President and General Manager was found in the person of Mr. George R. McKenzie, who had been a joiner and cabinet maker for the old firm at eleven and a half dollars a week. He was a hard-working mechanic, whose solid business worth and prodigious ability as an organizer and an executive took him by degrees to the post of General Manager of a business giving employment to forty thousand men, which post he fills to-day with eminent and acknowledged skill. The Secretary was Dr. Alexander F. Sterling, a physician of New York City, who possessed an unusual tact for business; and the Treasurer’s post was assigned to Mr. William F. Proctor, who had spent years at a machinist’s bench, and whose practical judgment and skill in mechanics are important elements to this day in the management of the business.

In 1876 Mr. Hopper resigned, and Mr. Edward Clark was unanimously called to the Presidency of the Company, and the active management of the business to whose early days he had devoted his abilities with such signal success.

Nor are these the only instances where men have risen from the ranks to high position in the Singer Company. Many years ago, when the old firm was battling with poverty, Mr. Singer sent a bright, energetic, but poor young man, to New Haven, Conn., to open an office and try to establish a business in Singer machines, saying to him, “Jim, we will send you all the machines you want, but not a cent of money.” It was the practical application of the polite Southern phrase, “Root, hog, or die.” The young man fought his way to business with desperate energy, and to-day is manager of the Central Office at Chicago, having a district covering several States and Territories, and has, within a single year, sold over two million dollars worth of Singer Sewing Machines.

Another young man, who worked as a clerk at six dollars a week in this same New Haven office, is now manager of the immense office at London, which manages the Company’s business in Great Britain and Ireland, France, Spain, and Western Europe generally, also Africa, Australia, South America and the British Possessions of Asia.

Not many years since, a bright German boy was employed in the factory, carrying water for the men and doing odd jobs. He did his trivial duties well, however; so well that he was rapidly pushed forward. Step by step he was promoted, and now is manager of the great Singer office at Hamburg, Germany, which does a vast business throughout Central and Eastern Europe, and is pushing its way into Western Asia. Like the others, he began without friends or influence, and has won his present proud position by faithful adhesion to duty in the humblest post, by modest energy and strict integrity.

[Illustration:

ASSEMBLING ROOM.]

The Central Office managers at Cincinnati and St. Louis, each doing a large business and entrusted with great interests and responsibilities, began at the lowest round of the ladder, and have climbed unaided to their present positions. Surely there has been no royal road to position in this remarkable company.

It is doubtful if the history of the entire world can furnish an instance in which any single house, doing a legitimate business, has had a growth so stupendous within an equal length of time. The reader will remember that Arrowsmith, the purchaser of Hunt’s first machine, failed to patent the invention because, among other reasons, it would require “at least three thousand dollars” to begin the business of manufacturing and selling sewing machines. Little did he dream that within thirty years a single company would have millions of dollars invested in the manufacture of one form of sewing machine! Arrowsmith urged for his fatal delay in procuring the patent to which he was then entitled, that the fees were so heavy—some $60! And now one company spends thousands of dollars annually in the various forms of advertising!

Still another reason urged by this enterprising smithy was that he “had other business.” Yet, within thirty years a single company finds itself with over ten thousand employés under regular salaries or wages, and thirty thousand more working the whole or part of the time on commission. And this Company, investing many millions of money in its business, spending thousands every year in

advertising, employing some forty thousand persons, eight thousand horses, and having its own locomotive and steamboat busy in transporting its machines and materials between New York and its great factory at Elizabeth, is, as the reader may have surmised, The Singer Manufacturing Company.

[Illustration:

JAPANNING FURNACES.]

Its system of agencies embraces the entire civilized world, and even pushes its outposts across the boundaries into semi-civilized lands. All of the United States and Canada are covered with this grand network of agencies; Mexico, the West Indies, and South America are familiar with the name “Singer.” Every nook and corner of Europe knows the song of this tireless Singer, too, and so do the colonized portions of Africa, Asia, and Australasia. An immense business is done in Singer machines in Australia; thriving agencies and sub-agencies may be found throughout China, Japan, and the Islands of the Indian Ocean. Calcutta has a large business in Singer machines, and even Cape Town and Transvaal, in South Africa, are giving the Singer agents an increasingly large patronage.

On every sea are floating the Singer Machines; along every road pressed by the foot of civilized man this tireless ally of the world’s great sisterhood is going upon its errand of helpfulness. Its cheering tune is understood no less by the sturdy German matron than by the slender Japanese maiden; it sings as intelligibly to the flaxen-haired Russian peasant-girl as to the dark-eyed Mexican Señorita. It needs no interpreter, whether it sings amid the snows of Canada or upon the pampas of Paraguay; the Hindoo mother and the Chicago maiden are to-night making the self-same stitch; the untiring feet of Ireland’s fair-skinned Nora are driving the same treadle with the tiny understandings of China’s tawny daughter; and thus American machines, American brains, and American money are bringing the women of the whole world into one universal kinship and sisterhood.

[Illustration:

CASTING IN THE FOUNDRY.]

The Principal Office of the Company is finely located in New York City, overlooking Union Square. From this office the general business of the Company is directed all over the world. The American business is transacted from twenty-five centres, located in the larger cities, such as Philadelphia, Chicago, San Francisco, Boston, Pittsburgh, New Orleans, Richmond, Cincinnati, St. Louis, etc. Each Central Office is controlled by a manager, under whose direction Branch Offices are located throughout the territory assigned to his care. Under the Branch Office agent, again, are located subordinate offices in every town or village within his district where business seems to warrant it. The territory controlled by a Central Office often embraces an entire State, and, in some cases, several States. In other instances two or more Central Offices are located within the same State. While the Central Office manager is charged with the general direction of all his Branches, and the Branch Office agent with the care and management of all his subordinate offices, yet the reader should not suppose these superior offices to be nothing but a sort of head-quarters for the officers of higher rank. Every Central Office is equipped with its force of canvassers, collectors, etc., and is expected to accomplish as much of the actual work of canvassing and selling as though it were the only office the Company ever opened. The same is expected of the Branch Office, and woe to that manager who cannot do duty as a private soldier, and make his own office an example in all respects to the smallest “sub!” It were better for him that the General Manager had never been born! The Canadian business is similarly managed from two Central Offices: one at Montreal, the other at Toronto. All these twenty-seven Central Offices report to New York, and receive their instructions direct from the officers of the Company.

The London office has immense interests confided to its care, as before stated. The South American business is managed from London, principally because England enjoys facilities of communication with that continent which even Yankee enterprise has thus far neglected to secure for our own country.

[Illustration:

NEEDLE DEPARTMENT.]

The business of Middle and Northern Europe and of Western Asia is managed from the Hamburg office, which, like the London office, makes a consolidated report to the principal office in New York. The total number of the Company’s offices throughout the world is over 4,500, of which over one-third are in the United States.

The foregoing are but a few of the interesting details of the organization and management of this remarkable Company. It is doubtful if any public or private corporation in the world can show so complete an organization. No bank is more scrupulously exact in every detail; no army has a more systematic discipline. And while such a complete system is necessary to prevent so enormous a business, covering so much ground, from falling to pieces by its own weight, yet it is also true that the very completeness and compactness of this organization are themselves the best possible guarantees for the permanence and indefinite prosperity of this gigantic corporation.

CHAPTER V. THE GREAT FACTORY.

Our lady friends may like to know how and where the “Singer” was made which has done such valued service in their homes, and as it is a most natural desire, we are glad to be able to gratify the same. We, therefore, cordially invite all who feel disposed to come along while we take a hurried, but, we hope, interesting glance at the various parts of this mammoth workshop.

[Illustration:

FORGING SHOP.]

[Illustration:

CLOCK TOWER.]

Leaving the City of New York by the New Jersey Central Railroad, we dash through a dozen pretty Jersey villages, cross Newark Bay upon a bridge which lacks but a few feet of being two miles long, rush past the walls of the great Singer Factory, and alight at the Elizabethport Station, just beyond. This is one of the seven railroad depots of the beautiful City of Elizabeth, New Jersey. Looking back down the track, we see a finely laid-out park, with well-kept walks, handsome shrubbery and trees, and a profusion of flowers, in the centre of which stands a large fountain. This is the private park of the Factory, and is by far the handsomest in the city. The Singer Company bought an entire block in front of the Factory, and transformed it into a park which they maintain at their own expense. Beyond “Singer Park” loom up the massive proportions of the Singer Factory, four floors high, the upper story having a massive Mansard roof. The building is built of brick, iron and slate, with iron beams and girders, and is proof against those conflagrations which so often destroy human life in large manufactories. The front is constructed of handsome pressed brick, and the structure is adorned with a tower in which a large clock shows the “hours as they fly” to all the neighborhood.

[Illustration:

SHIPPING SHEDS.]

Passing through the light and handsome offices, we find ourselves in what at first sight appears to be another park, shut in on three sides by long lines of high buildings. This is, however, not designed for a park, but is nothing more than the superbly-kept Factory Yard, embracing ten or twelve acres. Asphalt walks run down and across, connecting the various buildings that skirt the yard with each other, and with the dock at its foot. Beside and between the walks, every square foot of ground in this immense yard has been seeded with grass, whose green and well-kept borders are here and there fringed with shrubs and flowers. The walks are neatly kept, and though over two thousand workmen tramp daily through the yard, we will not see a bit of dirt as big as a filbert anywhere.[1] Up and down run railroad tracks from the main gate to the dock, with branch tracks to each shop door. These tracks aggregate over five miles in length, and are in constant use in bringing coal, iron, and lumber from the Central Railroad track outside, or the dock at the foot of the yard, or carrying car loads of machines to one or the other outlet. For this purpose the Company owns a locomotive, the “I. M. Singer,” which puffs away busily at its work from morning till night. Here are long sheds, beneath which cars are being loaded with Singer machines for Chicago, St. Louis, or San Francisco. There are long trestles opposite the foundry doors, upon which coal cars, direct from Pennsylvania mines, are pushed by the “I. M. Singer,” and their contents deposited “where they will do the most good.” Iron, sand, and lumber cars are sent similarly to the exact spot where they are to be worked up, and so an immense cost of handling is saved. At the dock, which lies along Staten Island Sound nearly a thousand feet, the Company’s steamer “Edward Clark,” is taking on board a cargo of machines for New York City, or perhaps for some European steamship lying in New York Bay.

Footnote 1:

An amusing instance recently occurred in a Southern State of the use to which these grass plats could be put by persons whose tender consciences would not permit outright lying. A man interested in selling a cheap imitation “Singer,” sent a letter to a Southern paper, enclosing a spear of grass which, he said, he “had plucked in the yard of the Singer Factory,” as evidence that the Singer Company was falling into decay, and its great factory being overgrown with grass and weeds.

Taking it for granted that all women are methodical, we must ask our fair visitors to go with us to the foot of the yard, and begin studying the manufacture of sewing machines just where the manufacturer is obliged to begin making them—at the foundry.

[Illustration: [Furnace]]

[Illustration:

BRASS FURNACE.]

Passing the great piles of pig-iron and the greater heaps of coal, we enter the foundries. Upon yonder high platform two men are throwing great lumps of coal into the blazing, roaring mouth of a fiery furnace; and presently they stop throwing in coal, and begin to pitch in heavy bars of pig-iron, while the furnace hisses aloud with its fervent heat till it reminds us of Nebuchadnezzar’s. At the foot of this furnace or “cupola” two or three men are catching the molten iron in a huge pot on wheels which, when full, is drawn to another part of the foundry, and there another lot of men surround it, their hand ladles are poured full, and away they hurry with their hot and heavy burden to fill the long rows of moulds which cover the floor. Four such cupolas are breathing out great blasts of fire at their tops, and running streams of fiery liquid iron at their bases. Three of them have a capacity for melting eight tons of iron each per hour, and the other converts six tons of pig-iron into liquid each hour. The morning hours are occupied by the moulders in making moulds in sand of the various parts to be cast; and for about two hours in the afternoon the cupolas send out their sparkling streams, and the men fill the moulds with molten iron. When sufficiently cooled, the moulds of sand are knocked to pieces and the iron taken out and thrown into piles about the floor, while the sand is shoveled up and moistened for another day’s moulding. Four hundred men are employed in this immense foundry, which melts up sixty-five tons of iron every day in the week. The ground floor of the foundry has an area of over _two acres_. Imagine a two-acre field filled every day with iron castings of Singer sewing machines!

And this is only a part of the iron work composing the machine. Much of the machine is composed of steel and wrought iron, which starts on its trip from the Forging Shop, instead of the Foundry. The portions cast in the foundry embrace the machine legs or “stands,” the “arm” and “bed,” the balance-wheel, band-wheel and a few minor parts. These parts, after cooling and being removed from the moulds, are taken to the Rumbling Room, 50 feet wide and 200 feet long, and put into revolving barrels filled with small five-pointed cast iron stars, which tumble about the barrels among the castings for hours together, and by the constant friction wear off all the sand and roughness.

The machine legs or stands then go to the Drilling Room, where the screw-holes are drilled out, and thence to the Japanning Room, where a set of grimy men, in half undress costume, souse them into a vat of liquid japan, after which they are put into great brick ovens, and left for several days for the japan to thoroughly bake and harden. This gives them a handsome, black, glossy finish and prevents rust. The other cast iron parts are similarly treated, except the “arm” and “bed;” these, after being firmly secured together, are japanned and scoured down; then japanned again, and again scoured down. A third japanning and scouring is then given and they go to the Ornamenting Room, of which we shall see something shortly. The wheels, and other parts which work against other portions of the machine, go before japanning to the Milling Department, an immense shop 1,250 feet long, upon two floors, and 50 feet wide, where they are put upon a lathe and shaved off with steel knives to the exactness of a hair.

Next above the Rumbling Room we come to the Forging Shop. Here numbers of great drop hammers are stamping out, at a single blow, the steel and wrought iron parts of the machines. These hammers weigh from three hundred to fifteen hundred pounds each. They are made with a “die” on their face, and the bed or anvil on which they drop has a corresponding die, so that a bar of hot iron held on the anvil is, by a single blow of the falling hammer, converted into a shuttle, a feed driver or a completely formed lever. Even the shuttle, which looks so much like a little boat, is made with a single blow of a huge drop hammer, which converts a square bar of iron in an instant of time into a perfectly formed shuttle. It is afterwards taken to another room, where another machine, with just one vigorous _push_, forces the shuttle through a sharp-edged aperture in a steel die, which trims off all unevenness and every bit of steel that may have projected beyond the edges of the die in the drop hammer. In another room the shuttle is drilled with holes for the thread; in another it is polished on an emery wheel, and in yet another is fitted with the little check spring, and then, after receiving the bobbin, it is ready for service in _your_ Singer machine. The Forging Shop is 423 feet long and 50 feet wide.

[Illustration:

STOCK ROOM.]

Leaving the Milling Department, each article is passed to the Inspection Department for “Parts,” where every piece or “part” is examined and measured with an accurately made steel gauge, and only such as are found to be exact and true to the thousandth part of an inch, are permitted to go on to the Stock Room. The rejected parts (and such is the accuracy of the machinery that these are comparatively few) go again into the furnace to be made over from the beginning. It is largely owing to the impartial rigidity of these inspections that the Singer machine has become so famous for evenness of work and for immunity from the periodical “fits” of misbehaving which so often afflict machines of other makes.

And so the Singer Company makes no second grade articles, and puts nothing but the very best material and workmanship into any of its machines, finding, by practical experience, that it pays to put just as good parts into its cheapest as into the highest priced pearled and ornamented cabinet machine. Indeed, the only difference between the cheapest genuine Singer and the most costly machine is in the finish, decorations and cabinet work. All the working parts are exactly the same.

The carefully inspected parts, after passing muster, are sent to the General Stock Room, where long rows of cases, extending nearly to the high ceiling, receive each sort into its appropriate box or shelf. Thence they are distributed in due proportions to the Assembling Department when called for. The Stock Room is 50 feet wide and 180 feet long.

Our fair friends will remember that we left the machine heads and bed plates in the Japanning Room, being scoured down after japanning. We must go back to them in order to keep up the connection. After being carefully scoured, the heads are sent to the Ornamenting Department, where skillful workmen pencil out, with a fine camel’s hair brush, the designs of flowers and scroll work which ornament that portion of the machine which rests upon the table. The rapidity with which these pretty and often intricate designs are traced is wonderful. Look at your machine at home; observe all the gilded ornamentation and design, and then fancy a man doing such a machine head “offhand,” without the least guide for hand or brush, at the rate of 100 machines a day! As quickly as the penciling is done the machine is seized by another man, holding in his hand a book of gold leaf, which he deftly lays over every pencil-line. The gold leaf firmly adheres to the “sizing” laid on by the brush and the rest is rubbed off by a single touch of another man who passes a piece of soft cotton batting over it. The whole is then varnished with the best quality of white varnish and placed in a huge oven, where it bakes till it has become perfectly dry, hard and glossy. The Ornamenting Room is 125 feet long and 75 feet wide.

[Illustration:

ORNAMENTING THE MACHINE.]

The larger parts of the machine having now been japanned and ornamented, are brought to the “Assembling Room,” and at the same time the small working parts are brought from the Stock Room, and here all these parts are “assembled,” or brought together, and each placed in its proper position within or upon the machine head. Each of these parts has been so nicely fitted, and so accurately worked by the machinery which made it, that when the numerous and varying pieces come together in the assembling process, it requires little and often no adjustment whatever, and each fits in the place made for it, resulting in a complete and harmonious whole. Connecting with this Department is the Adjusting Department, where long rows of machines on benches are being run by steam at a very high rate of speed. This is yet another of the many testing processes through which your family “Singer” has gone in order to insure the absolute perfection of its working parts. Up and down these long rows of humming machines, skillful and patient mechanics are passing, narrowly watching each machine to see if it runs smoothly and properly. If a wheel revolves unevenly here, or a “bearing” pinches or is too loose there, back goes the machine to have the deficiency remedied, after which it must again pass the same ordeal. The Assembling and Adjusting Departments are 50 feet wide, and occupy a length of 1,100 feet on two floors. The views in these rooms cannot be adequately described, and we therefore give our readers accurate full page representations of the same.

Next comes the Machine Inspection Department, 200 feet long and 50 feet wide. Here the machines are again inspected by competent artisans, and if perfect in every respect are passed over to long rows of girls, who put them through the further test of stitching, and see that they are capable of producing an absolutely perfect stitch. Over fifty girls are constantly employed in this particular work.

[Illustration:

“SETTING UP” THE MACHINES.]

The next process is what is technically known as “setting up.” The Setting Up Department is 460 feet long and 60 feet wide, and here the stands and tables are put together and placed in long rows; the complete machine head is properly fastened in its place, the belts and treadle are adjusted, and the machine stands on its table ready for duty.

Only one more operation is necessary for transportation, and that is packing or crating the machine. This is all done in the Shipping Department, which is 230 feet long by 60 feet wide. The boxes and crates have already been completely made up in the Box Shop, and nothing remains but to put the machine into the box or crate, as the case may be, drive three or four nails, mark the package with a stencil plate for its proper destination, on New England’s shores, on the great prairies of the West, amid the savannas of the South, or, perhaps, across the seas, lower it upon the elevator to the great shed, where it is loaded upon the cars. If its route lies _via_ New York, it is placed upon a platform car, which the Company’s own locomotive, the “I. M. Singer,” draws to the dock to be shipped on board the Company’s boat, the “Edward Clark.”

A few parts of the machine require to be smoothly polished in order to secure the very best working capacity, and these are sent to the Polishing Room, which is a study of itself. Black wheels of all sizes are here revolving with great speed; some are rolling around on a horizontal axis, some are whizzing rapidly on a perpendicular axis, and from all of them the streams of fiery sparks are flying in unceasing currents, throwing the grimy room and the darkened forms of the busy workmen into a still darker background. This Department is 125 feet long and 50 feet wide.

[Illustration:

POLISHING ROOM.]

Another room is devoted to the manufacture of the steel springs used in the machine. In another large department, 200 feet long, screws are being made by automatic machinery. In another room, 100 feet long, the tools are made and repaired, and here a large force of skilled workmen is constantly employed. In still another room, filled with electro baths, the silver plated attachments are covered with their silver coats.

The Button Hole Department is 150 feet long and 50 feet wide, and here the new Singer Button Hole Machine is put together. This is an intricate and wonderful piece of mechanism, by which an expert operator can make from 1,500 to 2,200 button holes a day, and sew the same thoroughly. This machine has but recently been introduced into general use, but has come rapidly into favor with manufacturers, especially tailors and makers of shoe uppers. It makes and works a complete button hole in either cloth or leather, and has come so extensively into favor that the Button Hole Department has outgrown its original quarters, and must be considerably enlarged. This, indeed, is true of almost every Department in the entire factory. When this great establishment was built, in 1873, it was thought a good week’s work to turn out 4,000 complete machines; but at this time its weekly product is upwards of 8,000 complete machines. Besides these, the Singer Company’s other factory at Glasgow, Scotland, is turning out between 4,000 and 5,000 complete machines each week, and yet the offices throughout the United States and Canada are complaining of the injury their business receives because they cannot get enough machines. The factory at the time of writing is largely behind its orders. Enlargements of various departments have been made from time to time, but the demand is yet far ahead of the capacity for production.

The Needle Department is one of the most interesting features of the entire establishment. Here a coil of steel wire of fine quality is put into a machine, which straightens, then grooves it on both sides above and below the spot where the eye of the needle should be, and cuts it to proper length. A girl then takes a handful of needles, and, feeding them into a machine, punches the needle eye at a single blow. Then they are ground down to a point; after which they are tempered, and then the inside of the needle eye is polished out to prevent its cutting the thread. The whole needle is finally polished, and nothing more then remains but counting the shining bits of steel and packing them away in boxes for the trade. The Needle Department gives employment to 100 men and 50 women.

Below the main building is a three-story brick building 200 feet long, in which the cabinet work is partly done. The Company has a large factory at South Bend, Indiana, where most of the black walnut tables, covers, and cabinet cases are made. Portions of these are sent to Elizabethport in a partly finished condition, and all such receive their finishing in this shop.

Still below is another similar building, the “Box Shop,” where some sixty men are employed in making the packing boxes and crates in which the machines are shipped from the factory. The Box Shop cuts up for this purpose no less than 300,000 feet of pine and

spruce lumber every month.

To run this immense establishment, six stationary steam engines are required, which have a combined strength of one thousand horse power. It takes twenty-two boilers, averaging seventy-five horse power each, to furnish the steam for running these engines and heating the buildings. The floors of the buildings have a combined area equal to _thirteen acres_ of ground; and every square foot of the entire area is in constant use. The whole premises, including the fine dockage, covers no less than thirty-two acres of ground.

Such, in brief, is the factory where your Singer machine was made, dear reader. It is believed to be the most complete, systematic, and best-equipped in the world. It is believed to be the largest establishment in the world devoted to the manufacture of a single article. It gives employment to over 2,300 men and women, and when it “shuts down” to take the annual account of stock, it takes 200 men to do it; and this they call “shutting up the factory!” The men are paid off every _Monday_, instead of every Saturday, and thus in more than one family the wife and children have had cause to bless the kind forethought which removed temptation from the path of some easily persuaded man, and saved him and his week’s earnings to themselves.

[Illustration: [Pouring Molds]]

The Singer operatives are among the most thrifty of mechanics. In every case of injury to any of its employés, the Company has dealt with great generosity, and many are the households from which much of the black shadow caused by sickness has been chased by the substantial aid it has afforded. Nor do the hands leave this work alone to their employers. Hardly a man is stricken by disease among their ranks but his comrades interest themselves in his case; and if pecuniary aid is required, the subscription list goes around till every want is supplied at the sick man’s home.

These kindly offices are not confined even to these ample limits. When the ghastly Yellow Fever Spectre was carrying dismay and death throughout the Southern States, the employés of this great factory made up, in less than four days, the splendid sum of $4,100, and sent it out on its errand of mercy to men whom they had never seen nor known.

The factory hands have organized among themselves several very creditable associations. One is a fine Rifle Team, to which the Company contributed a handsome badge for an annual prize; another is a Brass Band of excellent reputation, besides several Ball Clubs having very good records.

CHAPTER VI. THE REASON WHY.

There is a valid reason for everything in this world, whether we are able to find it or not, and for all this wonderful growth and Aladdin-like success there is a reason too. In 1872, when the great Chicago fire had impoverished thousands of the residents of that city, the Relief Committee undertook to furnish sewing machines to all the needy sewing-girls who might apply. Each girl was permitted to choose her machine from among the sixteen different kinds kept by the Committee. The total number of women who took machines was 2,944, and of this number 2,427 chose Singer machines, and the other 517 women distributed their choice among the fifteen other kinds of machines. These poor women expected to earn their living on these machines, and there must have been some reason why such an overwhelming majority of them took “Singers” instead of machines of other make, each of which was loudly proclaimed by its manufacturers to be the “best in the world.”

The Singer Machines have been awarded the first premium over all others more than two hundred times, at great World’s Fairs, at State Fairs, and at County Fairs in every part of the United States.

As we have before stated, three-quarters of all the sewing machines sold throughout the world in 1879 were “Singers,” and there must be a reason for that. When any one style of machine, used in millions of homes, leads all the other kinds to such an extent as that, there must be some way of accounting for it all, and if our readers choose to read on they will shortly discover why.

An interesting fact in this connection was related to the writer recently by Mr. Galland, a large manufacturer of ladies’ garments, whose factories are located at Scranton, Pennsylvania. The Gallands use several hundred sewing machines in their factories, operating them by steam. They had machines of many different makers originally, but gradually, as these machines wore out, had been replacing them with “Singers.” The reason assigned was that they had noticed, from time to time, that when a Singer machine became vacant, the girls who worked on machines of other kinds were clamorous to obtain the Singer and leave their own; and, when machines of other make were vacant, the girls were full of excuses for not taking them, but seemed desirous of waiting for the next vacancy, in hope of getting a “Singer.” These observations led to inquiry from their master mechanic, who explained that the

girls working on “Singers” lost less time in repairing, and in those peculiar sewing machine “fits,” than the girls who operated other machines. At this point the pay rolls were consulted by the inquiring proprietors, and there the whole secret lay exposed to view; for the work was paid for by the piece, and the rolls showed that the girls operating Singer machines were earning from one dollar to two-and-a-half dollars a week more than the other operators!

[Illustration:

TESTING THE MACHINES.]

Here then is the open secret of the Singer Machine’s favor with the people. It is so simple that a child can understand it; it is so strong that a bungler can hardly get it out of order, and every part (as we have seen) is made with such scrupulous exactness out of the best materials, fitted in its place to the _thousandth part of an inch_, and tested and re-tested so many times before it is permitted to leave the factory, that it does not get the “fits” which try a woman’s patience, destroy the fruits of her labor, and consume her time in vexing attempts to coax the machine back to duty. A gentleman wrote to the Company quite recently that he had a Singer Machine bought twenty-three years ago, and in use all that time, which sews perfectly to-day.

Many people sit bewildered by the immensity of the Sewing Machine trade, and wonder what becomes of all the machines. The answer is very simple. If the trade is large, the world is larger still. Carefully prepared statistics show that the entire world contains at the present time not over six million sewing machines, good, bad, and indifferent. The United States alone contain nearly ten million families. But fully one million machines are not in homes but in factories, operated by steam, driven at the highest possible speed, and consequently wearing out in a few years. Therefore, if all the machines in the world were brought here they would supply only half the families of our own land. The civilized countries of the globe, where sewing machines are now being introduced, have over seventy million families, not including China, Japan and India, where a trade is being rapidly developed. In a word, the sewing machine is now being offered to a population of not far from a hundred million families, and the world contains not more than six per cent. of the number of machines necessary to supply them, without considering the enormous consumption of machines in shops and factories.

It is plain, from these figures, that great as the trade has grown from the small beginning, it is yet in its infancy. Nevertheless, it has proved, except in a few instances, one of the most hazardous of enterprises. Probably as much money has been lost in the sewing machine business as has been made. The introduction of steam into manufactures and commerce has wrought changes so marked and rapid that none but keen and careful students of their own times could keep track of them, and thousands of good men have gone down because they had not considered the new elements introduced, particularly into manufacturing industries, by steam and improved machinery. These have brought in a subdivision of labor which our forefathers scarcely dreamed about, and which we have seen in our trip through the factory. It is almost incredible what speed a mechanic acquires whose task consists in performing one single brief operation, and repeating it over and over a hundred times an hour for months and years. We watched, with wondering interest, a man varnishing the under surface of the machine bed-plate. The space to be varnished was about a square foot in area, filled with obstructions and angles, every one of which must be touched with his brush. The operation was reduced to an exact science. His left hand caught the machine arm in just such a place every time; his brush went into the pot in just such a way; just so many sweeps it gave this way, exactly so many that way, and with precisely such a toss every time it was spun across the table to his assistant. Spring and summer, fall and winter, that man did nothing but wipe that brush just so many times across that square foot of iron, and he did it with a precision and rapidity that was marvelous. The quickest painter we ever saw could not do one machine while he would finish five.

[Illustration:

PUNCHING THE NEEDLE EYE.]

And this is but a type of several hundred different operations into which labor is subdivided here, and which, by such subdivision, is so cheapened that employers whose capital and business will warrant it, can pay labor a good price and yet drive out competitors who are without large capital, large business and skill to use the advantages which are thus available. On this rock many sewing machine manufacturers have split without, perhaps, knowing that it was only the lack of a large demand for their machines, and the absence of a large and well-directed capital which wrecked them. In the last few years over fifty sewing machine companies have failed, and swamped large nominal capital in the aggregate.

The lesson is almost too obvious to justify the formulating of a prophecy that the sewing machine business of the future is likely to concentrate in a comparatively few corporations, whose skill, capital and facilities will be sufficient to bring out the best machines, made of the best materials; paying their skilled operatives liberal wages, and yet enabled, by this subdivision of labor, to offer them to the people at a price within the reach of all.

Such is the story of the Sewing Machine from its paltry and inauspicious beginning. Such were the struggles and trials of the man to whose genius the world owes the vast, incalculable, and forever accumulating benefits of this great invention. And when we try to conceive what the world would be to-day if the Sewing Machine and all its concomitant blessings were suddenly removed from among its inhabitants, we look at this record of his achievements and rich triumphs, and rejoice that the common experience of inventors was not realized in the Sewing Machine invention, but that in this instance, at least, a great mechanician lived to see his

TELEPHONE TROUBLES. ————————

CHAPTER I.

DIRECT LINE.[1]

Bell Doesn’t Ring at all.

May be caused by any of following:

1st. Condenser open. 2d. Ringer open. 3d. Hook contacts crossed. 4th. Desk stand cords or induction coil crossed. 5th. Extention bell open. 6th. Ringer short-circuited. 7th. Trouble at central office.

1st. When condenser is open you will get weak hook clicks and side tones and hearing very weak. Prove by short-circuiting the condenser at the lugs with a test cord, which should make the ring of the bell and hearing O.K.

(While the condenser is short-circuited you will get only one hook click.)

2d. Only one hook click, the side tones normal, and the failure of the ringer armature to move when you raise or lower the hook, indicates that the ringer is open.

Prove by replacing the receiver on the hook and then bridge across the condenser lugs with your head receiver; if you do not get a good click every time you make contact, the ringer is open.

Or you can make the following test; open the strap at the top of the bell, then short-circuit the condenser lugs with a test cord; then connect one side of your head receiver to one of the line binding posts, and feel with the other side on the terminals of the ringer; if you get battery on one terminal and not on the other the ringer is certainly open.

3d. Only one hook click, side tones normal, failure of the ringer armature to move when you raise and lower the hook, and the receiver in circuit while the hook is down, indicates that the hook contacts are crossed together. When this is the case, the bell will ring poorly or not at all, and the ring can be heard in the receiver when the hook is down. Open the receiver circuit at one of the receiver binding posts, this should allow the bell to ring all right.

4th. Red and white strands of desk stand cord or primary and secondary of induction coil crossed together will generally cut down hearing; it may or may not cause only one hook click, and may or may not put battery through the receiver, and may wholly or only partly prevent the bell from ringing. Disconnect the strap on top of the bell and test with your head receiver from the G post to the L2 post; if you get battery there is a cross; disconnect the red and white strands of the desk stand cord, this will show whether the trouble is in the desk stand cord or in the bell. If it is in the bell, disconnect No. 2 and No. 4 terminals of the induction coil, and test again, to prove certainly that the trouble is in the coil itself and not in the wiring.

5th. If there is an auxiliary bell, and it is open, the set will test as though it had an open ringer. Test by short-circuiting the L2 and G posts, which cuts out the auxiliary bell and makes it a straight set for the time being.

6th. If the ringer is short-circuited you will get battery through the receiver, which can be detected by listening while you short-circuit the receiver binding posts with your screw driver blade. To prove, disconnect the bridge from the top of the bell, and connect the two line wires to the L2 and G posts instead of the L2 and L1 posts; short-circuit the condenser lugs with a test cord, and then bridge your head receiver across the ringer terminals; if the ringer is all right you will get a heavy click, if it is completely short-circuited you will get no click at all, if it is partially short-circuited you will get a partial click.

Bell Rings Weakly.

May be caused by:

Poor adjustment of armature or gongs.

Pivot screws too loose or too tight.

Clapper rubbing on guard.

Wiring interfering with the clapper stem.

“Whiskers” on the magnet heads.

Magnet heads sticky or gummy.

Desk stand cord, induction coil, or hook contacts crossed.

One or both coils of the ringer partially short-circuited.

Polarizing magnet weak.

Carbons in protector dirty and generator current jumping across them.

Trouble at the central office.

Bridge on the Line, Steady Light at Central Office.

Prove whether the trouble is in the instrument or not by disconnecting both sides of the line at the top of the bell and going in with your head receiver. If you get central the trouble is in the instrument and the same will be found either in the wiring, desk stand cords, or the hook. If opening the strap (see diagram No. 1) does clear the trouble, the leak is across through the ringer, and must be due to:

1. Receiver contact of hook not breaking. If this is the case, opening the receiver circuit at one of the receiver binding posts will clear the trouble temporarily.

2. White and green strands of the desk stand cord crossed together. If this is the trouble, disconnecting the cords from the bell will clear it.

[Illustration: Fig. 1.]

3. The condenser must be short-circuited if the trouble is not in the hook or cords; if the condenser is completely short-circuited, there will be but one hook click, but often there is enough resistance in a condenser short-circuit to give both hook clicks. To make sure that the trouble is in the condenser itself, and not in the wiring, disconnect one terminal of the condenser and go in series with your head receiver.

Instrument Entirely Dead, Nothing can be Heard in the Receiver.

See first that you have battery at the top of the bell.

The trouble may be due to:

1. Receiver circuit open. 2. Receiver short-circuited.

1. If there is an open in the receiver circuit, it may be in either the receiver itself, the receiver cord, the white strand of the desk stand cord, the receiver contact of the hook, or the secondary; bridge your head receiver successively around these parts, when you bridge around the open you will get the side tones in the head receiver.

2. To prove whether a receiver is short-circuited or not, connect your head receiver in series with it; if the head receiver responds while another receiver in series with it does not, the other one cannot be open, and therefore, must be short-circuited.

Transmitter out of Circuit, but Hearing not Entirely Cut Out.

May be caused by:

1. Open in green strand of desk stand cord, transmitter or transmitter wiring.

2. Transmitter short-circuited.

3. Red and white strands of desk stand cord crossed together.

1. No hook clicks, transmitter entirely dead, but can hear induction on the line, and can hear the effect of short-circuiting the line at the top of the bell indicates an open. Locate by connecting one terminal of your head receiver to the L1 post, and feeling with the other terminal successively on the several points of the transmitter circuit from the L2 post to the hook; as soon as you pass the open you will cease to get battery through the head receiver.

2. Strong hook clicks, transmitter entirely or nearly dead, but can hear induction on the line and the effect of short-circuiting the line at the top of the bell, indicates transmitter short-circuited. Open at the transmitter and put your head receiver in series to see whether the trouble is a short-circuit inside of the transmitter head, or a cross of the transmitter cord or the green strand of the desk stand cord with the frame of the desk stand.

3. Two hook clicks, but the transmitter dead and cannot hear induction on the line, and cannot hear the effect of short-circuiting the line at the top of the bell, and bell rings poorly or not at all, indicates red and white strands of the desk stand cord crossed together which short circuits the receiver while the hook is up. Disconnect the strap at the top of the bell, and test as previously directed from the G post to the L2 post; if you get battery the cord is crossed.

Transmission Poor.

May be due to:

1. Transmitter packed or otherwise bad.

2. Red strand of desk stand cord, primary, or hook contact open (in which case the hearing will also be poor).

3. Primary or secondary reversed.

4. Primary and secondary crossed together (this will also affect the hearing).

5. High resistance in the line or instrument.

1. When a transmitter is believed to be packed, call the wire chief, being very careful not to shake it up or jar it, and get him to note the way it transmits; then shake it up thoroughly, and see what the effect is on transmission. When a transmitter is suspected of packing but you fail to catch it in the act, you can sometimes pack it by blowing gently into the mouth piece for a minute or so; but in making this test be careful not to condemn a good instrument, as almost any transmitter is liable to a certain amount of packing, and will come up stronger immediately after having been shaken up.

When a transmitter is suspected of being otherwise defective a sure test can be made by temporarily swapping faces with some other instrument that is all right.

2. Only one hook click and weak side tones indicate primary or red cord open. Connect one terminal of your head receiver to the L2 post and test with the other successively on the L1 post, No. 1 and No. 2 terminals of the induction coil, red cord post in desk stand, hook spring, and hook; as soon as you pass the open you will not get battery.

3. Examine 1 and 2, and 3 and 4 of the coil to see that they are not reversed, that is, see that the numbers of the coil terminals correspond with the numbers of the lugs that they connect to. If the coil is reversed internally, so that the numbers correspond but nevertheless one of the windings is wrong, it can only be detected by the man at the other end. Call up the wire chief or go to another instrument yourself and listen to the transmission from the suspected instrument; if the coil is reversed the transmission will be muffled. Prove by reversing either the primary or the secondary, which should clear the trouble.

4. Test as previously directed for primary and secondary crossed together.

5. Get the wire chief to test the resistance of the line, or test it yourself as follows: Bridge your lamp on at the top of the instrument, the lamp will burn rather dimly on an ordinary line, very dimly if it is a long line, or an extension line from a private branch exchange with a high resistance drops and retardation coils. (In the latter case the test can be made better after the operator has plugged up the line.) Next connect your line in series with the instrument, take the receiver off the hook, and compare the brightness of the lamp while the instrument is in circuit, and while it is cut out by short-circuiting the L1 and L2 posts. If there is much difference noticed there is a high resistance in the instrument. Forty ohms is a fair average for the resistance of a central battery instrument, but it may be higher or may be lower, it may run below 30 ohms. About 16 ohms of this is in the primary and the rest is in the transmitter.

[Illustration: Fig. 2.]

To prove that there is no resistance in the soldered connections or hook contact, short-circuit both the primary and the transmitter; this should cut out all of the resistance and completely short-circuit the instrument, so that you will get no battery from L1 to L2 posts when the hook is up.

The resistance of a 24 volt test lamp is somewhere about 400 ohms cold and 240 ohms hot.

Hearing Poor.

May be due to:

1. Receiver bad.

2. Receiver cord or white strand of desk stand cord bad.

3. Condenser open.

4. Primary and secondary crossed together.

5. Primary short-circuited.

6. Secondary short-circuited.

7. High resistance in secondary circuit.

There will be two hook clicks with any of the above troubles, but one of the clicks may be cut down more or less.

1. Examine the receiver for dented diaphragms, “whiskers” on the magnets, magnets too close to diaphragm, or magnets weak; test by putting your head receiver in series with it and comparing the hearing.

2. To test the receiver cord and the white strand of the desk stand cord, put battery through them and listen in the receiver for a cut out or scratchy sound while you shake them. Short-circuiting the condenser with a test cord puts battery through the receiver and its cords when the hook is up.

3. If the condenser is open the ringer usually will not ring, but sometimes you can ring through a condenser that you cannot hear through at all. Test by short-circuiting it with a test cord.

4. Primary and secondary crossed together will usually short-circuit the ringer and prevent your getting a ring. Test as previously directed.

5. If the primary is short-circuited bridge your head receiver around it; you will get no click when the hook comes up, and no side tones. If the primary is all right you will get both clicks and side tones in your head receiver.

6. A short-circuited secondary can be tested by exactly the same method as is given above for testing the primary.

The above tests work very well if the primary or secondary is completely or nearly short-circuited, but if the short circuit is only partial it is very hard to detect. If you are in doubt, change the bell temporarily for another bell that is all right or change the induction coil, and compare results.

7. To test for a high resistance in the secondary circuit, put battery through it by short-circuiting the condenser with a test cord while the hook up, then listen in the receiver while you short-circuit successively the receiver hook contact, the two sides of the receiver cord, the white strand of the desk stand cord, the wiring from receiver cord to secondary, from secondary to condenser, and from condenser to L2, and the secondary itself; when you short circuit out any part of the circuit that contains resistance, such as the secondary itself, more battery will flow through the receiver, giving you a click.

An instrument in which the ringer is not connected, will, of course, give but one hook click.

Reversals in the connecting up of desk stand cords may cause only one hook click or poor hook clicks, poor transmission, poor hearing, transmitter nearly dead, etc., according to the combination in which the three strands of the cord are connected.

If the ground side of the line is open outside the set may be put in temporary service by working to a local ground.

If the induction coil is bad, temporary service can be given, if necessary, by putting the transmitter and receiver in series, and properly poling the receiver.

CHAPTER II.

TWO PARTY LINE.

No. 1 Set.

(The battery side of the line goes to the L2 post.)

Gives two hook clicks, and can be tested in very much the same way as a straight set, but the following points should be remembered: on sets that ring to ground an open ground will, like ringer open, cause the bell not to ring and only one hook click.

Resistance in the ground may cause poor ring.

Reversal of the three wires on top of the bell may cause only one hook click, bell not to ring, and transmitter nearly dead.

Transmitter very poor may be caused by the ground side of the line being open outside. (You can still call the operator and talk, with difficulty through the ringer and ground.)

No. 2 Set.

Gives but one hook click, but otherwise can be tested in very much the same way as a straight set. Remember the following points:

On sets that ring to ground:

Ground open will prevent bell from ringing.

Resistance in the ground may cause poor ringing.

A ground on the ground side of the line may cause the bell to ring poorly or not at all by taking the generator current off to ground before it reaches the instrument.

Condenser short-circuited will not only put a ground on the ground side of the line through the ringer, but on exchanges which use pulsating current for ringing will also cause bell to ring poorly or not at all.

Reversals of the three wires on top of the bell may cause two hook clicks, bell not to ring, and transmitter nearly dead.

On two-party sets, to find reversals of the wires at the top of the bell, trace out the wire to the protector, or else find out with your head receiver which one of the three wires is alive to both of the others, or to an independent ground. This one is the battery side of the line.

To test for reversal of the ground wire with the ground side of the line, bridge your head receiver from an independent ground to the two doubtful wires successively. You will get induction on the line wire, and none on the ground wire. Or, bridge your receiver from the battery side of the line to the other two wires successively; the one that gives the most induction in this case is the ground wire. Or again, test by bridging your lamp from the battery side of the line to the other two wires successively. If the ground is good, bridging to it will give a brighter lamp than bridging to the ground side of the line; only a little brighter if the line is short, much brighter if the line is long.

The above is also the way to test for a poor ground. The resistance of the ground return back to the central office should be less than the return through the cable, therefore the lamp should burn brighter on the ground wire than on the ground side of the line; very little brighter if the line is short, much brighter if the line is long.

An extension bell open will prevent the main bell from ringing, just as in a straight set. Test by running a temporary ground, or by short-circuiting out the extension bell.

If you are in doubt when testing a two party set, disconnect the ground wire and strap the bell, making it a straight set temporarily, and then test the ringing, transmission, and hearing. A straight set will respond to all rings, direct, two-party, and four-party.

If on a two-party set the ground side of the line is open outside, temporary service may be given, if necessary, by working to the local ground.

If the ground is open, temporary service can be given, if necessary, by converting to a straight set; but in this case the bells will respond to both calls.

If second instrument is properly poled and bell rings when first station is being called, the trouble is probably due to party at first station taking his receiver off the hook before the operator has stopped ringing, and vice versa.

CHAPTER III.

FOUR-PARTY SET.

(Diagram No. 3.)

Tests of the transmitting and hearing circuits can be made in very much the same manner as in a straight set. On account of the relay coil being bridged between No. 2 and No. 3 terminals of the induction coil, a four-party desk set, if in perfect order, will give two hook clicks, no matter how it is poled.

To make a perfectly sure test for primary and secondary crossed together, it is necessary to disconnect one terminal of the relay winding; then with the receiver on the hook, test from the L2 post to the secondary with your head receiver; if you get current there is a cross.

Reversals of the three wires at the top of the instrument may cause a variety of troubles, just as in the two-party sets.

Ringing Circuit.

=Relay=: Failure of the relay to come up when the operator rings may be caused by:

Condenser open.

Relay short-circuited or open.

Hook contacts, or red and white strands of desk stand cord, or primary and secondary of induction coil crossed together.

Primary open.

Trouble at central office.

Test just as though it was a straight set except when testing for relay short circuited, or for a cross between primary and secondary, (in which case you must open one terminal of the relay winding, as previously directed); and except when testing for relay open, which you can do by bridging your head receiver from L2 post to No. 2 and No. 3 terminals of the induction coil successively; you should get strong battery on No. 2 terminal, if the relay is all right and a strong condenser discharge when you make contact, but a weak battery click when you break contact, on No. 3 terminal.

A ground on the ground side of the line may also prevent the relay from operating, by carrying the generator current off to ground before it reaches the instrument.

If the relay is held up, usually the lamp is kept burning at the central office also, and this means that current is flowing from the central office over the battery side of the line, passing through the relay winding, and returning to the central office over the ground side of the line, or through the ground wire and ground. This condition may be due to:

1st. Winding of relay crossed with frame. Test by disconnecting the “A” or “B” terminals of the ringer from L2 which should release the relay.

2d. As in the case of current through the ringer of a straight set, the trouble may be caused by receiver contact of hook not breaking, white and green strands of desk stand cord crossed together, condenser short-circuited. Test as though it was a straight set.

[Illustration: Fig. 3.]

If the relay vibrates continuously the winding is probably crossed with the frame. To find out whether this is the case, disconnect the ground wire, which should stop the vibrating.

If the relay “jumps” while the operator is ringing, instead of pulling up and staying up as long as the ringing current continues, the relay may be weak, due to a part of the winding being short-circuited out, or to some other cause; or there may be too many bells and relays on the line, so that, owing to the resistance of the line, not enough generator current will flow over it to divide up and give each bell and relay a proper amount of current; or there may be a slight ground on the line, which carries off a part of the ringing current.

To prove that a relay is all right:

1. Short-circuit the condenser; this should hold up the relay, by putting battery current through it.

2. Prove that the spring contact is not crossed with the frame as follows: Disconnect “A” and “B”, then connect the frame of the relay to battery with a test cord, and bridge from the spring contact to ground with your head receiver; if you get no current there is no cross.

3. Prove that the winding is not crossed with the frame as follows: Disconnect “A” and “B” and then test with your head receiver from the frame to the L2 posts; if you get no battery there is no cross.

=Ringer=: If the relay comes up, but the bell does not ring, the trouble may be due to:

Ringer poled wrong.

Bias spring too tight or too loose.

Ringer open.

Ground open.

Ringer short-circuited.

Bridging your head receiver across the ringer while the operator is ringing will show whether or not you are getting generator current on the terminals of the ringer winding; going in series at the “A” and “B” terminal will show whether or not you are getting current through the ringer.

To prove whether a ringer is open or not, connect “A” to battery, hold the relay closed, and then test from “B” to ground with your head receiver; if you get no current the circuit is open; prove that the open is in the ringer itself by testing direct from the two terminals of the winding successively.

The ground can be tested in the same manner as on a two-party set.

To prove that the ringer is short-circuited, connect “A” and “B” across the line, close the relay contact, and bridge across the terminals of the ringer winding with your head receiver; if you get no click the ringer must be short circuited; check this test by putting your head receiver in series with the ringer, while it is connected across the line, and closing the relay contact; this should give you a strong click if the ringer is short-circuited.

=Bell ringing weak may be due to=:

Poor adjustment of armature.

Poor adjustment of bias spring.

Pivot screw too loose or too tight.

Clapper rubbing on guard.

Wiring interfering with clapper stem.

“Whiskers” on magnet head.

Magnet head sticky or gummy.

Polarizing magnet weak.

One or both coils of ringer partially short-circuited.

Too many bells and relays on the line.

Ground on one side of line which takes part of the generator current off to ground before it reaches the instrument.

Trouble at central office.

Earth currents.

To test for earth currents bridge your head receiver from the ground side of the line to the ground; you should get no current; if you do get current you will probably find that it varies continually, being due to trolley cars; report the matter to the chief inspector. In making this test be sure that the line is not in use; if the receiver is off the hook at any station on the line you will get a false test.

Earth currents very often cause bell troubles on suburban stations, particularly those that lie near to trolley lines; but in the city, earth currents are seldom noticeable.

=False rings may be caused by=:

Very strong earth currents.

One coil of ringer short-circuited.

If a biased ringer has one coil short-circuited, then when it is poled for either 1st or 2d stations it will respond to both rings; and likewise when poled for 3d or 4th stations it will ring with either current.

In the bell diagram No. 3 you will see that “B” connects to the spring contact of the relay, the frame of the relay connects to the biased side of the ringer, and the unbiased side of the ringer connects to “A.”

In the older bells, “B” connects direct to the biased side of the ringer; the unbiased side of the ringer connects to the spring contact of the relay, and the frame of the relay connects to “A.”

Therefore, in connecting an extension bell to a set that has no extension bell binding posts, connect one side of the wire to the frame screw of the relay, under the bottom of the set, and the other side to the post at the top of the bell that “A” connects with. Or solder one of the extension bell wires to the spring contact of the relay, and connect the other to the post at the top of the bell that “B” connects with. In every case the auxiliary bell must be connected across the terminals of the ringer without being bridged around the break of the relay. Pole the extension bell by reversing the wires either at the bell or at the set.

=Ringer Adjustments=: In adjusting a biased ringer find out the two points where the bell ceases to ring on account of the bias spring being too tight and too loose, and adjust the spring half way between these points. To locate them, slack off the bias spring until it has no tension at all, and then get the operator to ring while you tighten up the spring, and note the point at which the bell commences to ring; continue to tighten the spring until the bell ceases to ring; by making the adjustment half-way between these two limits, you will have a margin both ways, so that if the generator rises a little above or falls a little below its proper voltage, the bell will still ring.

The little set screw in the yoke at one end of the armature should be adjusted so as to hold the opposite or bias spring end of the armature a little away from the head of the magnet core; 0.02 of an inch, which is a little less than the diameter of a No. 22 cross-connecting wire, “In every test use a little judgment.”

CHAPTER IV.

HOW TO TEST FOR AND CLEAR TROUBLES IN PRIVATE BRANCH EXCHANGE SWITCHBOARDS.

=Station can’t call=: When a station can’t call, the trouble may be due to the line being open, or too much resistance in the line; or to the signal being open, or short-circuited, or stuck.

Short-circuit the line in the back of the switchboard or at correcting frame; if the signal does not operate plug up the jack with a plug and see if the cord signal will operate; if it will not the open is between the frame and the springs of the jacks if the cord signal will operate, the trouble is back of the jack springs, and may be an open, or it may be that the drop is short-circuited or stuck. Test with a receiver or lamp, if you get good battery on the locknuts but can’t throw the drop, it must be short-circuited or stuck; if you get no battery there is an open; short-circuit the inner contacts of the jack, and if this brings up the signal the open is in the jack; take the jack out and repair it. If short-circuiting the inner contacts will not operate the signal, the same may be open; test from the ground strap of the jack direct to the signal terminals; if the signal tests all right the wire leading from one side of the signal to one inner contact of the jack must be open; prove by short circuiting same out with a test cord.

If there is battery on the jack but the signal won't come up, push gently against the back of the armature of the signal with a tooth pick until it starts to raise; you can tell by the feeling if it is at all stuck.

Another good way to tell whether the signal sticks is to go to the station and hold the receiver to your ear and then allow the hook to raise. When the signal flies up it can be heard in the receiver as a sort of "tremble." This "tremble" should take place the instant the hook comes up; if it is delayed, the signal must be sticking.

This test can also be made from the frame with a head receiver.

To test whether the signal is short-circuited, see how brightly your lamp burns when connected at the frame and then compare with other signals which are all right; a signal which is wholly or partly short-circuited will have less resistance than the others, and the lamp will burn brighter.

If the signal comes up from the frame but will not come up from the instrument, the line may have too much resistance and the signal will have to be adjusted so as to be more sensitive.

If a station on a long line has trouble calling at times, there may be a poor connection in the circuit which varies; or it may be that the signal fails to work only when the board is busy, due to the drop in voltage on the battery feed when much current is being drawn from it; the signal will have to be adjusted more delicately or the battery feed increased.

[Illustration: Fig. 4.]

=Station Signal Stays up=: The line must be either crossed, or grounded on the battery side. Plug into the jack with a detached plug and cord, and then test successively on the ring and tip of the detached cord with a receiver or lamp that is connected to battery. This will show if there is a ground on either side of the line. If both sides test clear of grounds, there must be a cross; to prove this, ground the tip side by holding the tip of the detached cord on the tip of any other plug; if there is a cross the ring side will then test grounded. To locate the trouble, open the line successively at the frame cable box instrument, etc., and note the effect on the signal.

In testing with a receiver for grounds or crosses on lines, you should be guided by the click when you break contact; otherwise, you are likely to be deceived by the electrostatic capacity of the line and condenser in the instrument. In such tests you may get a strong click when you make contact, particularly if the line runs through a cable, and you may also get plenty of induction on the line; but if you do not get a click when you break contact, there is no current flowing through your receiver, and therefore the line is clear.

If plugging into the jack does not restore the signal, the trouble must be a cross in the jack, or in the signal itself. Examine the jack lugs, and also the inner end of the signal winding, which may be in contact with the iron mounting strip. If the trouble is not here, disconnect the wire going to the jack from the signal; this will show whether the trouble is in the signal itself.

If the sleeve of a station jack is grounded, the cord circuit relay will operate when you plug into the jack, and cut the battery off of that pair of cords. Touching the tip of a plug to the sleeve of a station jack with the listening key thrown will show if the sleeve is grounded by giving a click in the operator's receiver, the same as touching the sleeve of a trunk jack will do. The ground may be due to the sleeve being crossed with the sleeve of a trunk jack, or crossed with the sleeve of a station jack that is connected to a trunk jack; or it may be between the sleeve and the inner contact of the jack on the ground side.

=Battery Feed and Trunks=: The battery feed and trunks must always be poled properly. To test the poling of the feed, run a temporary ground and touch it to the ring of the back plug. If this does not bring up the cord signal the feed is poled wrong, and the feed and ground will have to be reversed.

To test the poling of a trunk, plug into the trunk-jack with the front plug of any pair, say No. 1 pair; then touch the tip of any other plug to the ring of the back plug of No. 1 pair; if this does not bring up the cord signal on No. 1 pair the trunk is poled wrong.

One of the troubles caused by the wrong poling of a trunk is that if the operator plugs in to answer the trunk while she has another listening key thrown, her transmitter goes dead.

If operator at the central office can't throw a trunk drop at a private branch switchboard the same may be open, or the condenser may be open. Bridge a receiver across the drop; if you can get a good ring in the receiver the condenser is all right and the drop is probably open. If you can't get a ring across the drop, short-circuit the condenser; if this puts battery through the drop and brings it

up, the condenser must be open.

If a cord circuit relay fails to operate on any trunk, the ground strap may be broken off of the jack. Plug up the jack, then touch the butt of the plug with the tip of a plug of any other pair; if this operates the relay, it shows that the sleeve of the jack did not operate it, and therefore the sleeve connection must be open.

The sleeve connections are often taken off purposely on tie trunks.

If the operator complains of central cutting her off, some of the holding coils may be open. Instructions are given further ahead for testing them.

If plugging up a trunk causes the cord circuit relay to vibrate the battery feed or ground must be open.

If the line or cord signals fail to come up properly the battery feed may be weak; this may be due to a poor connection in the feed or ground, or to one of the conductors of the feed being open, or to the feed being grounded through resistance. Bridge a lamp across the feed; it should burn brightly if no current is being used on the switchboard. Throw a listening key, or bridge a receiver across the feed; if this puts the lamp out, or dims it excessively, the feed or ground has a high resistance on it, or some of the conductors are open. Disconnect the conductors one at a time at the table head or protector, and see if each one will light your lamp properly. If the lamp burns dimly when no current is being used on the switchboard, the feed is probably grounded through resistance; disconnect it from the switchboard and test; if it still gives a dim lamp disconnect at the protector and test again to prove whether trouble is inside or outside.

The amount that a lamp bridged across a battery feed will be dimmed by throwing a listening key or bridging on a receiver depends upon the resistance of the feed. If the feed is very long the lamp will be dimmed very much; if the feed is short or consists of several pair, the lamp will be dimmed but slightly. Each inspector should become familiar with the behavior of the battery feeds on all his important boards; he should know how the lamp burns when the board is idle, and how much it is dimmed when a certain number of connections are up, so that in case of trouble he can tell at once by a lamp test whether the feed is O.K. or whether it has too much resistance, or is partially grounded.

Troubles Causing Bells to Ring.

A swinging open or swinging ground on the battery feed causes the bells at the stations to ring by charging and discharging the condensers.

Generator feed crossed with the battery feed causes bells to ring. Examine wiring and generator contacts at ringing keys.

Where the spring of a station jack does not break from, or is crossed with the inner contact, all bells may be rung by ringing on that jack with power generator, which is always grounded on one side.

If the outer contact of a ringing key makes before the inner contact breaks, all bells may be rung when that key is used, by the generator current passing down through one side of the retardation coil to the battery feed.

Cord Circuit.

Tip and sleeve crossed causes vibrating relay on that pair.

Tip and ring crossed short-circuits the cord.

Ring and sleeve crossed causes relay to vibrate when ring and tip of plug are short-circuited, or when the plug is put in a station jack with the station receiver off the hook,—sometimes merely throwing the listening key on that pair will make the relay vibrate.

Touching ring to tip and tip to ring of the two plugs of any pair should give a spark, and the signal should also come up when the ring of the plug is touched with a tip. If there is trouble, take any other plug which is O.K. and test the bad pair; if both rings or both tips fail to give a spark, there is probably an open at the relay, the retardation coil, or the soldered connections on the listening key. If only one cord tests open, and the other one of the same pair tests O.K., ring on the bad cord and feel for generator current in the plug. If you get current, the open must be at the inner contact of the ringing key; or, it may be in the cord signal. If you cannot get generator on the plug, the open is in the cord.

To locate any open that effects both cords, test successively on inner contacts and swinging contacts of relay, inner and outer lugs of retardation coil, and swinging contacts of listening key, you should get battery across all of these points.

If either cord of a pair is short-circuited it short-circuits both cords and you will not get proper sparks when touching ring to tip and tip to ring but you may get small sparks. Also the operator's transmitter will be dead on that pair of cords and if you test with a receiver or lamp you will get little or no battery between the ring and tip of either plug, but will get battery of about half the proper strength from either the ring or the tip of either plug to either the ring or the tip of a plug of any other pair.

You can also tell whether a cord circuit is short-circuited by bridging your receiver around one half of the retardation coil; if there is a short-circuit, part of the current that is flowing around through the coil will go through your receiver, giving you a click.

To locate the short-circuit, ring on the two cords successively, and feel on the plugs for generator. If both cords test clear, the trouble must be back of where the circuit branches at the listening key; disconnect successively at the relay, the retardation coil, and the listening key until you locate the trouble.

In most of the private branch exchange switchboards the battery goes first to the inner contacts of the relay, then through the swinging contacts to the retardation coil, and from the retardation coil to the swinging contacts of the listening key; in other boards the battery goes first to the retardation coil, then through the relay contacts to the listening key. From the listening key it goes to the inner contacts of the ringing key, and from the swinging contacts of the ringing keys to the cord fasteners.

If a cord circuit is open at the relay or retardation coil, it will still work on a trunk connection, the trunk supplying the battery, if the central office is common battery system.

Lamp tests of the retardation coils and cord signals can be made by bridging a lamp across the bus-bars and then short-circuiting the tip and ring of every cord successively. Each one should dim the lamp the same amount; if one cord dims it less than the others, it shows that there is more resistance in that cord circuit—possibly a bad connection, or a cord signal with too much resistance. If one cord dims it more than the others, there must be less resistance in that cord circuit, probably one half of the retardation coil is short-circuited. (This test fails where there is a floater battery, or a battery feed of very low resistance.) To prove that one side of the retardation coil is short-circuited, short-circuit one of the plugs of that pair, and then bridge a receiver successively around the two sides of the coil, no click on one side should mean that that side was short-circuited.

A finer test can be made by bridging the lamp across the tip and ring of the cord, and short-circuiting out the two sides of the coil successively; each side should brighten the lamp exactly the same amount. If one side brightens it more than the other, that side has more resistance than the other.

Unbalanced coils are usually noisy, especially on long lines. An unbalanced coil can usually be detected by simply listening on each pair of cords, successively; if the battery feed induction is stronger on one pair than on the other, that pair is probably unbalanced.

In most boards the holding coil is bridged across the outer contacts of the relay. In other boards one end of the coil connects to one swinging contact of the relay, and the other end to the opposite outer contact. To test the holding coil, plug into a trunk jack with the back plug and throw the listening key, which will bring up the cord signal, then throw the listening key normal. If the signal stays up the holding coil is O.K., if it disappears the holding coil circuit must be open. The trouble may be that the relay contact does not close, or the coil itself may be open.

Test by plugging into a trunk with the back cord and then short-circuiting the holding coil; if the cord signal comes up the holding coil must be open; if it does not come up, leave the short-circuit on the coil and bridge out the holding coil contacts of the relay. When you bridge out the contact where the open is, the signal will come up.

To test the relay on any cord circuit, touch the tip of any other plug to the sleeve of either plug of that pair; if this does not operate the relay the sleeve conductor of the cord may be open; if neither plug of the pair will operate it, the relay itself may be open; test with a receiver or lamp.

Touching the tip of one plug to the sleeve of the other plug of the same pair should make the relay vibrate.

To test a switchboard cord, plug into the cord testing jack (every board should have a testing jack connected to put battery direct on your head receiver) and shake the cord, and turn and shake the plug in the jack, while you listen in the operator's receiver for any

cut-off or bad connection. Do not have any listening key thrown while you are testing switchboard cords; also see that the operator's receiver is poled so that the current from the cord strengthens the magnetism instead of weakening it otherwise you will not get a sensitive test. The tips and rings of the plugs must be clean, or else they will be scratchy.

Be very careful that none of the plugs are bent or "lopsided;" such plugs may work all right in some jacks and cut-off in others. If turning a plug around in a jack causes a cut-off the plug should be condemned; sometimes the jack may be at fault, and the long spring will have to be given more "set." After changing switchboard cords, always test the new ones for opens, short-circuits and reversals.

=Cross-Talk=: Solder dropped on the cord fasteners, or a cross at the keys, may connect two different cord circuits together, and cause cross-talk between them.

Retardation coils may be crossed with their cases, and cause cross-talk by the cases being in contact. Condensers on trunk drops may make two trunks cross talk in the same way. Test by bridging a receiver from the case of the suspected coil or condenser to battery and to ground successively. There will be no click if the case is clear.

Unbalanced retardation coils, or a weak battery, may also cause cross-talk.

A listening key that does not break contact on both sides will cause cross-talk when that pair of cords is used; if with all keys normal you get a click in the operator's receiver when you touch the tip of any plug to the frame of the operator's transmitter, the operator's circuit is in contact with some cord circuit at the listening key. To find out which key, see that all keys are normal and then vibrate the relay on each pair of cords successively by touching the tip of one plug to the sleeve of the other; when you come to the pair where the cross is, the buzz will be heard plainly in the operator's receiver; on the others it will be heard very faintly.

=Operator's Set=: To test the receiver cord, put a plug in the cord testing jack, this puts battery through the receiver, and by shaking the cord any fault will show up provided the receiver is poled properly. Do not have any listening key thrown when making this test.

To test the transmitter cords, throw up any listening key and listen in the operator's receiver while you shake the cords.

To locate an open in the operator's primary circuit, throw any listening key, and then bridge a receiver successively around the several parts of the circuit, that is, the 200 ohm resistance coil, the transmitter, (including its cords), and the primary. When you bridge around the part that is open, you will get a click in the receiver.

To locate an open in the secondary circuit, short-circuit out the condenser so as to get battery through the circuit and then bridge around the receiver and secondary with a receiver until you have found where the open is.

=Buzzer and Buzzer Relay=: If a buzzer which works off the battery feed fails to operate at times, although the buzzer relay comes up, probably it is not sensitive enough, and when the board is busy the battery feed it not strong enough for it. Adjust the buzzer more delicately and test it when the board is idle and when it is busy. To make a board busy artificially, bridge a head receiver across the bus-bars; that is equivalent to several pairs of connections being up.

If some of the station lines are very long, the buzzer relay may fail to come up on them, or come up so weakly as not to make good contact. To cure this, adjust the relay more delicately.

If a trunk drop won't operate the buzzer relay when the key is up, the trouble is probably at the night bell contact of the drop. If none of the trunk drops will operate it, the relay may not be adjusted delicately enough, or the 500 ohm resistance coil may be open. Bridge around the trunk drop contacts with a receiver. If you get no battery the coil must be open; prove by bridging the coil out and repeating the test.

A heavy ground on the ground side of any station line will prevent the buzzer relay from coming up by shunting it out. A light ground will sometimes cause trouble on the long lines only.

A short-circuited condenser or a slight leak across any line or lines, may hold up the buzzer relay. Test the lines for crosses and grounds, as previously instructed. If the buzzer relay comes up at times when no signal is up, the trouble may be due to some station on a long line trying to call, and the signal not sensitive enough to come up.

General.

To prove that a board is perfectly clear, disconnect the battery feed from the negative bus-bar, and put a lamp or receiver in series. If you get no current then all the lines are free from crosses, they are free from grounds on the battery side, and the other circuits in the board are also clear of crosses. (This test can only be made when there are no connections up, no listening keys thrown, and no stations calling.) To prove that the ground sides of all the lines are clear, disconnect both the feed and ground wires from the bus-bars, and then test through a lamp or receiver from the battery feed to the ground bus-bar; if you get no current, the lines are all clear on the ground side.

INSPECTION

How to Inspect Subscribers' Instruments.

1st.—Ask the subscriber if his instrument works properly and repair any defect that he reports. Also be sure the instrument is securely fastened to the wall or desk.

2d.—Clean and polish the varnished and nickeled parts of the instrument; open the bell and see that it is clean and in proper condition inside, and that the hook, ringer, and other moving parts work properly and clean the hook contacts with paper if they are dirty or make a scratching noise in the receiver.

3d.—See that all binding post connections are tight, test all cords; in testing the receiver cord, put battery through it by short-circuiting the condenser; change any cords or other parts that are defective or unsightly.

4th.—Clean the receiver outside, remove the cap and examine the diaphragm and clean the magnets; in cleaning the magnets rub them off with your coat sleeve or a clean rag rather than with your hands, as the moisture from your hand will cause them to rust.

5th.—Examine the adjustment of the bell and test by getting a ring from the operator, at the same time test the transmission and hearing.

Test all extention bells by getting a ring from the operator; inspect all other apparatus, such as hand generators, switches, local batteries, fans booths and signs. It is important that signs should be kept in good condition; dirty or unsightly ones should be cleaned or ordered changed, and you should be particularly careful to see that all signs are securely hung.

6th.—Inspect all wiring, including the leading in wires, the inside line wires, the battery wires and the ground wires; also the protection, the fuses, any extention bells and also see that the ground is properly made that it is connected to the proper pipes. If a gas pipe has been used see that the bridge on the meter has not been disturbed since the last inspection.

7th.—See that the protector contains the proper kind of fuses, and if it can be gotten at readily; examine the connections and remove the cap from over the carbons to see that no one has left the carbons out.

8th.—If a subscriber applies to you to have an additional instrument installed, take his name and address and turn them in to the manager; if he wants his telephone moved or disconnected, or circuit number changed, or extention bell or sign installed, request him to call up the managers office.

If he complains of poor operating service, or of interference by other subscribers on his line, refer him to the manager.

If he complains of some trouble that is in the outside line or at the central office, report the matter to the chief inspector at once.

9th.—In making recommendations, state briefly but plainly just what you want done and give the reason why. If the installer has done any work at the station since your last inspection, and has failed to leave it in proper condition, accompany the recommendation that you make with a written complaint.

Making First Inspections of New Installations.

In inspecting a new installation, or an instrument that has been moved or changed since your last inspection, or in going over your instruments for the first time, the inspection should be made more carefully than at other times.

Ask the subscriber if he has any extention stations, extention bells or other apparatus attached to his instrument, also look out for them while you are making the inspection and tracing out the wiring.

Open the desk stand and see that all the locknuts are tight and soldered connections are perfect.

Examine and shake all soldered connections in the bell.

Trace out all of the wiring and be sure to see that all splices are properly soldered and taped and see that no tacks are driven in the splice.

Make a lamp or receiver test of the protector and the instrument ground, to see that they are good and have no resistance.

See that the protector is securely fastened, that the connections are all tight, that the fuses and carbons are of the proper kind, and that the micas have the open side down.

Test the fuses for loose connections inside, by bridging your head receiver across the binding post at the instrument end of the protector and listening for a cut-off, while you shake and jar the fuses.

Test all switches to see that they make all proper connections, oil the hand generators and see that the bell clapper works freely.

See that the specifications have been complied with in placing the protector and the instrument, in running all the wire, and in every other particular; that the desk stand cords are cleated, and protection cleats used where needed; that desk sets give two hook clicks; that snap switches are of the indicating type; that the connections to all binding posts are neat and of proper length; that the booth is clean and have plugs in all the screw holes; that they have no broken glass and have linoleum on the floor, and that the doors and latches all work freely.

See that the protector is placed so as not to be in the way of curtains; that no damage has been done to the subscribers property; that all apparatus has been installed so that it will not be in his way, and will not be exposed to disfigurement, damage, trouble from dampness or rain, etc., that wire is run where it will be safe from injury, dampness and wear; in short, see that the installation is done according to specifications in every respect.

See that the cut-in (the wires from the pole to the house) are properly made and are of the proper kind of wire.

DON’T FORGET THAT YOUR REPUTATION AS AN INSPECTOR IS AT STAKE.

FOOTNOTE

[1] Where reference is made to “hook clicks” in these instructions, the instrument is understood to be a desk stand, wall sets are so connected as to give only one hook click on raising or lowering the hook.

When reference is made to the red, white or green strand of the desk stand cord, it is understood that the red goes to the hook, the white to the receiver and the green to the transmitter, using the standard Western Electric cord.

When reference is made to L1, L2 or G you will find them on diagram No. 1 or No. 2. When reference is made to “A” or “B” you will find them on diagram No. 3.

———————————— End of Book ————————————

Transcriber’s Note (continued)

Page 42 – “deskstand” changed to “desk stand” (Open the desk stand)

Page 43 – “lineoleum” changed to “linoleum” (have linoleum on the floor)

Footnote – “G1” changed to “G” (When reference is made to L1, L2 or G)

The words “extension” and “extention” are used interchangeably throughout the book and have been left unchanged. Some missing punctuation and other minor typographical errors have been corrected without note.

The single footnote has been placed at the end of the book.

Some Points in Choosing Textiles

By

Charlotte M. Gibbs, M. A.

SOME POINTS IN CHOOSING TEXTILES

In the past century a great change has come about in the position of the woman in the home, which has very vitally affected her relation to the textile industries. In the early days in this country nearly every woman produced the clothing for herself and family, also the household linens from the raising of the sheep or flax to the finished product. Now all is changed; with the introduction of ready-made suits and other garments, even the sewing is rapidly going from the home, while the manufacture of cloth is a forgotten art.

In olden times the quality of home-spun and woven material was the best possible to be obtained from the materials and methods known. Woolen cloth was all wool, and linen cloth was not adulterated with starch, or half cotton. Honest and durable materials were the rule of the day.

With the introduction of machinery and the factory system came keen competition. Modern discoveries, chemical and otherwise, have increased the possibilities of cotton, linen, silk and wool so that now it is difficult to recognize the original fiber in some of the materials sold.

Thus on the one hand the field of textile knowledge has grown very much, while on the other hand the knowledge of women concerning textile fabrics has decreased, since they are no longer the makers of cloth, nor do they always gain a knowledge of its characteristics through the making of garments. The result has been that women depend more and more on the word of clerks, who are often as ignorant as themselves, until by painful experience the buyers learn some of the things to be avoided.

As cost of living increases, and demands upon the family purse increase, it is more and more important that the woman of the household should know how to spend the family income most economically. Since from ten to twenty percent of this income is spent for clothing and house furnishing, it is imperative that more thought and careful study should be put upon this branch of household economy. The object of this bulletin is to give some bits of information about textile fibers, their manufacture and adulteration, which may help in gaining that judgment in buying essential to every woman.

Certain adulterations and devices of the modern manufacturer are so skillfully concealed as to be detected only by the use of chemical tests, or the high power microscope. With these this bulletin will not deal, but only with those qualities and adulterations which may be detected without the aid of laboratory equipment. Much of course may be learned by experience, but it seems better to save time and money by knowing beforehand what is to be demanded, what guarded against.

Each one of the common materials used for textile fabrics, cotton, linen, wool and silk, has its characteristics, each its definite uses. Certain peculiarities in physical or chemical nature make each fiber peculiarly adapted to certain uses, but so long as these general

qualities are maintained the variety of materials produced from these fibers may be enormous. Combinations of fibers in one material, adulteration with cheaper fibers, or with starches or metallic salts, may serve to reduce the cost, and yet the purpose of the material may be fulfilled. For certain purposes the materials may be used interchangeably.

COTTON

Cotton is cheap and very plentiful. It has short, flat fibers, with a spiral twist, thus giving elasticity and the possibility of being spun into fine thread. Being in itself very useful and inexpensive and capable of replacing, to a certain extent, any other fiber, it is used in very large quantities the world over, and is manufactured into a great variety of materials. The quality of these materials depends on the strength of the fibers, the fineness or coarseness of material, the weave, the color and design, and the adulterations.

Cotton, being cheapest, is not adulterated with any of the other fibers mentioned, when the material is to be sold as cotton cloth, but it can be made to appear heavier by the addition of mixtures called sizing. Starches, gums, dextrine, glue, china clay, as well as other ingredients in varying proportions, constitute this sizing which may add a large percent to the weight of the cloth. The spaces between the threads are filled up and a good finish is given to the cloth, although the wearing quality is not increased. If present in large quantities the cloth is greatly reduced in weight and firmness after the first washing.

Adulterations of this kind can be detected by the feeling, a large quantity imparting a harshness to the material. In very thin fabrics the sizing may often be detected by holding the cloth up to the light when the starch shows between the threads. Washing or thorough boiling of a sample will show the amount of sizing present.

Another method of adulterating cotton is shown in certain kinds of dotted swiss. A good swiss has thread dots woven or embroidered in the cloth. Fig. 1A shows a piece of material sold at the price of a good swiss, but in this case the dots are merely a heavy paste, printed on the cloth. Fig. 1B shows the result of continued washing, where the dots have disappeared, and Fig. 1C, the result of ironing with a hot iron, which turned the spots brown before the cloth itself is harmed.

Mercerized cotton is a cloth produced by the action of a strong alkali on cotton fiber rinsed under tension. It is a strong, attractive material, with good wearing qualities. An imitation of this may be made by the action of very heavy and very hot cylinders on ordinary cotton cloth. The mercerized cloth has a high luster which it retains after many washings while the imitation loses its luster with the first washing.

Sometimes cotton cloth which has been on the market for some time is weakened by the action of the chemicals used in bleaching, dyeing or in the sizing. This may be easily detected by tearing the cloth.

Standard cotton materials such as muslins, organdies, percales, calicoes and sheeting, differ only in the weight of the material, fineness of thread, hardness of twist and method of finish. Ginghams have the thread dyed before weaving and fancy weaves are frequently used. Duck, denim and some other heavy materials have very hard twisted threads and are frequently woven with a twill. Silkolene is a trade name for a fine cotton cloth with a silky finish given after the cloth is woven.

Mercerized cottons make lustrous materials as poplin, imitation pongee and numerous attractive house furnishing materials.

India “linon” is entirely cotton, with a fleecy surface on the wrong side, as is “outing flannel” and “canton flannel”.

Many “tussahs,” “voiles” and “economy linens” and other materials with rather deceptive names are cotton materials made to imitate silk, wool or linen.

LINEN

Linen was formerly the most important vegetable fiber, and was commonly used for all household purposes. Of late years it has been largely replaced by cotton with which it may be compared although there are still uses for which we demand linen, and others for which we prefer linen to cotton.

The linen fiber is long, smooth and quite lustrous, when spun into a thread. It is very strong and there are not so many fuzzy ends as are found in cotton. Cloth made from it is not only lustrous and rich looking, but because of its smoothness stays clean longer than cotton. The snowy whiteness of linen obtained with some difficulty in bleaching is quite permanent, and since the fiber takes dyes with difficulty and parts with them quite readily, it also does not retain stains as persistently as cotton does.

Linen is much more expensive than cotton, and when linen prices are paid linen should be demanded. Since the two fibers are rather hard to distinguish, especially when heavily starched and given a good finish, it is quite easy to deceive the buyer. “Linen” collars are frequently largely cotton, “linen” handkerchiefs may not have a thread of linen, as is apt to be the case with rather inexpensive embroidered handkerchiefs, and table “linen” may be mercerized cotton, cotton and linen, or even ordinary cotton.

[Illustration:

A

B

C

FIG. 1]

To distinguish linen from cotton, examine the threads carefully; cotton is made up of short fibers which project from the surface of the thread, and become fuzzy when the thread is rubbed between the fingers; when broken, cotton has a tufted end, while the linen fibers break more unevenly and leave a more pointed end. The linen thread should be stronger than the cotton; it has more luster and is usually more uneven. Some kinds of linen have flat threads, but cotton is frequently finished in imitation of flat thread linen.

The old test of moistening the finger and putting it under the cloth is not always a sure one, as the moisture will not come through a heavy linen, or one with much starch in it, and it will come through a sheer, tightly twisted cotton. A better test is to put a drop of olive oil on the cloth and press between blotting papers. The linen becomes more transparent than the cotton.

There is a peculiar leathery feel about good table linen, which cotton will not give, and the luster is different although the difference is hard to describe.

The typical weaves used for linens are as follows. The damask, satin or sateen weave used for table linens and towels is especially good for the former because of the very smooth lustrous surface it affords, but not so good for towels as it does not absorb moisture very readily, although it is very attractive. Huck, an uneven weave, giving a good surface for the absorption of water, makes splendid towels, and decorated with designs in damask weave may be very handsome. Many linens in plain weaves are available for clothing, embroidery, etc., while the coarse Russian crashes are becoming quite popular for decorative purposes.

The texture of linen is such that the heavier kinds hang well in folds, lie flat on a table, and are very artistic for many purposes.

WOOL

Wool, the second fiber in amount used for clothing, is an animal fiber and differs greatly from the vegetable fibers discussed. Wool from the sheep’s back differs from hair of goats or other animals in several ways. Wool is very curly, and possesses a scaly structure in a much more marked degree than hair, in which the external scales lie flat. The surface of wool has sometimes been compared to a pine cone, or the scales of a fish, although these two are quite different. The scales on the wool fiber when moist and warm stand up, more as the pine cone, and when cold and dry or cold and moist, lie flat. This peculiar structure of the surface of the wool fibers gives them the property of felting, or matting very closely together. Wool is also quite elastic, although it has not great strength.

Since the demand for woolen cloth far exceeds the supply of new wool there are many devices for making the supply go a long way, and consequently many methods for deceiving the buyer. In adulterating a material the manufacturer seeks a material cheaper than the fiber he wishes to adulterate, one which can be concealed readily. Wool when combined with the cheaper cotton fiber makes a material which wears well, but does not keep its shape as well as all-wool cloth, is less warm, and should of course receive a lower price than all-wool.

Because of the felting property of wool it is quite possible to conceal a good deal of cotton under the surface of the woolen cloth, and when the fibers are mixed before the threads are spun the task of detecting them becomes doubly difficult.

WOOLENS AND WORSTEDS

Two classes of cloth are manufactured from wool. Woolens are made usually of short wool carded and spun into yarn in which the threads lie in all directions. This is woven into cloth which usually has the surface heavily felted, so that all of the intersections of

threads in weaving are covered. Here then is splendid opportunity for adulteration, since cotton or poor wool may be covered up by the surface felting.

WORSTED

The other class is made from longer staple wool, combed, and drawn until the fibers are parallel, then hard twisted. When woven the ends of the threads do not project on the surface, and the finish is not intended to cover the weave, hence it is more difficult to adulterate unless entire cotton threads were woven with the worsted, and these are more easily detected than a mixture of cotton and wool, or shoddy in woolen cloth. Common examples of woolens are flannels, broadcloth and venetian cloth; of worsteds, serge, challie, men's suitings and voile. Mohair is a worsted cloth woven of the wool of the Angora goat, with a warp usually of cotton or silk.

[Illustration:

B

C

D

FIG. 2]

The most reliable tests for a mixture of cotton and wool are chemical or microscopic ones, but as these are not practical for the average buyer, others must be sought. Wool has luster and "kinks;" the ends of the threads are stiff and look rather wiry. When a sample is carried home, burning will serve to distinguish between the two. Wool burns slowly, chars, has an odor of burnt feather, goes out easily and leaves a crisp ash; cotton burns quickly with a flame, with little odor and leaves no ash.

A little practice in breaking the threads will help one to distinguish between the two; the difference is not one that can be easily explained, but the experienced housewife knows it well.

Fig. 2A shows a sample of all-wool cloth, of the class of worsteds which cost seventy-five cents a yard. Fig. 2B shows a sample of cloth of the same price, called by the clerk, all-wool, but which on examination was found to have only four threads of wool to every twelve threads of cotton. Fig. 2C shows this same cloth with the wool removed by strong alkali, caustic potash, leaving the cotton. Fig. 2D shows the wool left when the cotton has been ravelled out, or has been removed by a strong acid solution.

Fig. 3 shows a sample of mohair in which the wool has been partly removed, and the cotton warp is left. In this case the price is not high, and because of the character of the cloth the mixture is a good one, light, smooth, and clean. This cloth is not sold for all-wool, so is not considered adulterated.

[Illustration: FIG. 3

SHODDY]

As has been said before, the demand for woolen goods is so much greater than the supply that it is necessary to resort to various measures to increase the supply of cloth. One method is to use the wool over and over again. Rags are bought up by the rag man, sold to the larger dealer, again to the "shoddy" manufacturer who cleans them, sorts them, tears them to pieces, using the best all-wool rags to produce fibers, which are respun and again woven either separately, if of very good quality, or mixed with new wool or cotton. Such a material is warm, looks well for a time and has its place, but must not be bought for new wool, or demand the price of good woolen cloth. This industry is enormous and shoddy is often found in expensive novelty materials as well as in cheap "all-wool" cloth. Because of the shortness of the fibers it may be detected readily, when used alone, but in combination with good wool it is more difficult.

One class of shoddy consists of very short fibers, clippings from the mills, which are worked into the surface of a felted cloth after it is woven. These short fibers after a time work out, and are found in the bottoms of coats, inside the linings, etc., leaving the surface of the cloth threadbare.

Fig. 4 shows a piece of shoddy cloth, sold for all wool at fifty cents a yard. This cloth would be warm, but does not look as well as more expensive cloth, and will not wear as long as new wool. There is some cotton mixed with the wool before spinning, therefore it is difficult to detect.

[Illustration: FIG. 4]

SILK

Silk is frequently known as the fiber of luxury. It is the most expensive to cultivate, the most beautiful and the strongest fiber. Since it is the most expensive fiber to buy, and the demand for it is so great, the temptations to adulterate are also naturally very great. The long, strong, lustrous silk fiber which bleaches and dyes beautifully and is fine as a spider's web, is not to be duplicated. The best grade or "reeled silk" is taken from the cocoon in one continuous thread which may be several hundred yards long. In manufacturing reeled silk many defective cocoons are found in which the fibers are not perfect, or are broken. The silk from these cocoons may be treated like a short fiber and spun into threads varying in strength according to the length of the fibers. This so-called "spun" silk has not the high luster nor strength of "reeled" silk, but is often used as warp with reeled silk filling, or in imitation pongee, and back of satins, velvets and in many other ways.

In olden times the price of silk was much greater than now, but the material was much more durable. Silks which have been laid away for a hundred years are still in fairly good condition. Now our silks are much cheaper, but the result is that when they are put away, even for a few months they may fall into bits, and their wearing quality can not be compared with the good old silks of long ago. The reason for this change is not hard to find. The cost of raw silk is about thirty times that of raw cotton and the waste at least five times that of cotton. The manufacturer must make up in some way if he is to sell silk at the prices demanded by the public.

Silk has a very great ability to absorb dyes and metallic salts without apparently changing the quality of the material, and since dyes and metallic salts are much cheaper than pure silk, the manufacturer makes great use of these materials. Loading is the common name for this process of treating silk and it is common practice to add thirty percent of foreign material, just the percent lost by the silk when the gum is removed, while it is possible to add two hundred fifty or even three hundred percent.

When we buy novelties and do not care how short their life is to be, these heavily weighted silks answer the purpose very well, but when we wish for durability and the silk begins to crack and split or to become shiny after a few wearings we realize the disadvantage of our modern methods. Practically no silk can be found on the market entirely free from loading, but there is a great difference in the amount present.

Burning is the simplest test for good silk; a thread of pure silk will burn slowly leaving as it burns a very small amount of crisp ash in a ball at the end of the thread. Heavily weighted silk burns and leaves the ash in the form of the original thread; this ash of course drops to pieces readily. Fig. 5A shows a piece of taffeta sold for one dollar a yard. Fig. 5B shows the result of burning the silk. This ash, left in the shape of the original sample, is made up of metallic salts, dyestuffs, etc. A very small percent of ash would be left from the silk itself.

Another method of adulterating silk is with cotton. The fibers are not spun together here as the cotton and wool, but the threads of the two materials are woven together. In satins, velvets and brocades the cotton is entirely covered by the silk threads on the surface, and appears as the back of the cloth. In cheap silks a fine cotton thread sometimes forms either warp or filling.

Pongee is a material made from the cocoon of the uncultivated silk worm; rajah, tussah and other uneven, coarse materials are from the same source. These silks are very strong, but do not have a high luster. Mercerized cotton looks quite silky and is sometimes mixed with these silks, or a material of mercerized cotton and spun silk may be sold for pongee, or even a material entirely of mercerized cotton.

CONCLUSION

To sum up, the adulterations most likely to be found and the tests for them are as follows:

METHOD OF ADULTERATION
1. By combination. Use of other fibers than the one indicated by the name of the material. Example, cotton in woolens, cotton in linens, etc.

2. By substitution. Selling one fiber under the name of an entirely different one. Example, mercerized cotton sold for silk or linen.

[Illustration: A

B

FIG. 5]

3. By increasing the weight of a material. a, Cottons and linens with starch; b, silks with metallic salts and dyes.

4. By giving a finish which is deceptive. a, Heavy pressing or calendering an ordinary cotton to imitate mercerizing; b, finishing cotton to look like linen; c, printing paste dots on cotton to produce the effect of embroidered dotted swiss.

5. By use of made-over yarns. Example, shoddy in woolens, also addition of short wool, felted in surface.

TESTS FOR ADULTERATION

1. Examination of cloth to see if all threads are alike, and to distinguish kind of thread.

2. Examination of individual threads.

Cotton: short fibers, ends appear fuzzy in thread.

Wool: short fibers, decidedly kinky and stiff.

Silk: long straight fibers with luster; if spun silk, fibers short; thread looks more like cotton; breaks more easily than reeled silk.

Linen: strong threads; high luster; when broken ends very uneven and straight.

3. Burning tests: a, cotton burns quickly with flame; b, wool burns slowly, chars, gives off odor of burnt feathers; c, silk burns slowly, leaves small crisp ash, and when weighted leaves more ash; d, linen, similar to cotton.

4. Linen if without much starch, becomes translucent when treated with olive oil; cotton remains opaque.

5. A mixture of cotton and wool when wet, wrinkles more than pure wool.

6. A careful examination of the finish of the material. Observe if alike on both sides, if the apparent beauty of the material is due to finish or to good quality of material.

Finally, the best grades of material are generally what they seem to be; although this does not always hold true in silks, nor in materials where the effect is more important than the wearing quality. Expensive broadcloths, worsted suitings, expensive table linens, good cottons, do not pose for more than their true worth. It is when one turns to novelties, to silks and to inexpensive materials that one needs to be most vigilant. Be sure the inexpensive is not cheap, unless you want a material, cheap in wearing quality and appearance, as well as in cost.

OTHER POINTS IN BUYING

Aside from the question of whether the buyer is getting the kind of material she pays for as to character of the fiber, there are other things to be considered in choosing textile fabrics.

The weave affects the appearance and often the wearing quality of cloth. A close twill weave makes a firm, durable material, while the loose basket weave gives quite a different effect and is frequently lacking in firmness. The satin or sateen weave makes a beautiful surface especially in linens or silks, but may cover up defects in the hidden threads. Fancy weaves in cotton novelties, in shirt waist materials and in fancy mulls, etc., often leave loose threads which become soiled easily and may not be as attractive after washing. A cloth with a very heavy cross thread or filling, and a very fine warp, or vice versa, may split because of the great difference in the strength of the threads.

Sometimes figures are woven in such a way that when the cloth is finished each figure has short ends of thread. For example, in weaving madras curtain material, the filling thread which makes the figure, jumps from one figure to another, and after the material leaves the loom the loose threads are cut off of the back of the material. Often these short pieces wash out or the ends become rough and fuzzy looking.

In choosing a material from the large variety on the market the first thing to be determined is the use to which it is to be put, then determine what is appropriate to that use. The cloth which is suitable for a street suit is obviously not suited to the party gown, neither are laces of dressy waists appropriate for working clothes. Clothes that are to be worn constantly need to be of material that will stand frequent cleaning. In materials used in house furnishing certain ones must be cleaned often, and unless one can afford to pay frequent cleaner's bills, washable materials are better for curtains, bed-spreads, table-covers, etc. The cost is the next point to be considered, and that must necessarily be determined by one's purse. It is not always economy, however, to buy the inexpensive things, for, as we have seen, the inexpensive articles are more likely to be the cheap ones. With our desire for continual change, our love of novelty and fad we have become very extravagant. So long as the fashion demands new garments every few months and women attempt to follow the styles, they must choose inexpensive materials unless they have a large amount of money, and care nothing for wearing quality. In the end, however, the woman who buys carefully, makes use of conservative styles which do not change every few months, and chooses handsome material, is not only more economically, but also usually better dressed.

The hygienic properties of materials should be carefully considered. Those next the body should be able to care for the perspiration and the excretions of the skin. Woolen and silk are best suited by their physical structure to do this, but wool is too warm and too irritating to many people, and does not wash well, while silk is too expensive. Many kinds of cotton underwear have been manufactured which by their structure aid in absorbing moisture. Underwear knitted or woven with meshes containing large enclosed air spaces is more hygienic than closely woven cotton garments. The air spaces in the mesh material are non-conductors of heat, and also ventilators. The closely woven garment does not allow a change of air next the skin and becomes clammy when moist. Garments which come in contact with the outside air must be more closely woven to keep out the wind. Two layers of lighter weight material are warmer than one layer of thick because of the non-conducting air between. Heavy clothes are bad for the body because of the extra load which must be carried about.

Finally, in choosing materials, if one is to have the greatest pleasure from them and give one's friends the greatest pleasure, color and design are very important. Colors should be suitable to the use, and to the person who is to wear the material. Bright colors make one conspicuous, and are exciting; dull ugly colors are depressing, while soft rich colors are elegant, becoming, and in good taste.

Designs should fit the place in which they are to be used. Rugs should be so designed that they serve as a background to the furniture of the room as well as add richness in color and some variety. Materials which are to hang in folds should have designs which do not depend on smoothness of surface in order that they may be effective. For clothing, designs should be inconspicuous, modest stripes, dots and plaids being most successful, except on very soft thin materials when larger and less conventional designs may be used.

To be an intelligent buyer it is necessary then that the woman knows before she purchases a piece of cloth just where it is to be used, just what she can afford to pay for it, what she should be able to get for that amount of money and then be able to tell whether the piece of cloth she buys is really what it is represented to be. At the present time the rush to the bargain counter, the enormous amount of cheap, poor material manufactured, and the great waste in dress, all go to prove that there are many women who are not intelligent buyers.

When women demand a better quality of materials and refuse to buy the cheap things, the manufacturers will cease to produce worthless things. Perhaps however, before that day arrives, the thoughtful workers of the land will have succeeded in passing a pure textile law, which shall do for our cloth what the pure food act is doing for our food supplies; then the honest though ignorant buyer will be protected, but it will still be her part to demand good, artistic and useful materials.

"To build, to build! That is the noblest art of all the arts. Painting and Sculpture are but images, Are merely shadows cast by outward things On stone or canvas, having in themselves No separate existence. Architecture, Existing in itself, and not in seeming A something it is not, surpasses them As substance shadow." —LONGFELLOW, in _Michael Angelo_.

PREFACE.

I have written this short history of architecture to meet the requirements of those who wish to become acquainted with the main facts without having to read voluminous works, many of which are addressed, not to the student, but to the connoisseur, who is presumed at the start to have a knowledge of the subject sufficient to enable him to comprehend critical and theoretical essays.

The plan I have adopted has been to trace the origin of each style, its characteristic points and its connection with those which preceded and succeeded it, without introducing technical terms or any but the most important dates.

There is a temptation to enter into the social and political histories of each building race, but brevity forbids this, as well as any of the gushing descriptions usually found in modern handbooks on art.

I imagine that very few people have the time to read lengthy treatises on architecture, but that there are many who would be glad to know the chief historical facts, were these to be presented within a small compass. I hope, therefore, that this volume may be of interest to the general reader and may find its way to schools other than those which make art matters their specialty, for it seems to me that if the average schoolboy were taught as much about the history of the most useful and beautiful of the creations of the people of each age, as about the manner and quantity of warfare and slaughter in which they indulged, he would obtain as valuable a quality of information.

A SHORT

HISTORY OF ARCHITECTURE.

INTRODUCTION.

Architecture is an art combining the qualities of utility and beauty. Its object is, and has been from its origin, to satisfy both the necessities and tastes of the various building races.

For this purpose the two distinct, and yet closely related, sciences of construction and decoration have been employed, and the history of the progress which has been made in each, goes hand in hand with the history of each age and each race.

The requirements of the inhabitants of every country have always been defined by its character and climate, and, in order to satisfy these requirements, the art has adapted itself to them and grown up and expanded in the different fields in which it has been directed.

It is customary to explain the origin of the art of building somewhat as follows: The first impulse of the barbarian, in whatever part of the globe he may be born, is to seek a shelter from the varying temperature of night and day. If he lives in the mountains, he chooses the caves and clefts in the rocks for his habitation; if on the plain, he follows the example of the animals and hollows out a retreat in the ground where he may seek warmth and protection. Where the soil is rocky, he gathers branches and moss, and piles them in such a manner as to form a rude dwelling. Soon after, he perceives the inconvenience of these untrimmed boughs, and remedies the discomfort by driving four straight posts into the ground, and roofing them over with cross-pieces, inclined so as to shed the rain.

This is the first semblance of a thoughtful construction, and the improvements upon it gradually develop into the more studied forms of architecture.

When the first requisite of shelter has been obtained, the early builder cuts off the rough edges and carves upon the posts rude emblems of the natural objects he sees about him, and in doing this takes the first step in design and decoration.

When wood is not abundant, he seeks a similar result in stone, and the treatment of each material gives rise to distinct principles of construction.

The Greeks, who had marble-quarries of easy access, bridged over their posts or columns with straight lintels, capable of supporting the weight of the roof without danger of fracture. The Romans, who found their travertine difficult to handle, built their baths and palaces of brick, and, in seeking to connect their pillars and piers, adopted the round arch as a means of effecting this end, and this round arch was the main principle of Roman architecture. When, in due time, the pointed arch was found to combine great strength and beauty, this new method of building became the leading principle of Gothic art. So, according to each necessity, the different styles of architecture arose.

When civilization increases the requirements of man, it is no longer possible to begin a rude construction, and alter it afterward to suit these needs; therefore it becomes necessary to consider beforehand all the elements required, and, in order to facilitate this consideration, drawing comes in as a simple means of placing before one all that enters into the proposed building.

Therefore, in the study of architecture four divisions of the art must be considered, namely: The construction of buildings with various materials, the appropriate proportions of the same, their representation by draughtsmanship and their history in various times and among various peoples.

It will be readily understood that each of these divisions embraces a wide scope individually, and yet no one can be separated from the others without affecting the result as a whole.

It is proposed, therefore, to review briefly the history of this art, and the causes which have affected it, in order that, knowing the reasons which led to the formation of each style, the student may follow its study with the practical understanding and logical inference which lead to the best results.

* * * * *

The question of which country furnished the first or earliest period of approach to civilization in the building of monuments or habitations has been, and is likely to be, an open one for some time to come.

Speculative discussion on this point can serve no end of importance to architects; it interests more especially the historian and antiquarian. Consequently we will, for the sake of convenience, glance over the periods of architecture in the following order:

1. Celtic or Druidical remains. 2. The Monuments of Egypt. 3. Asiatic architecture. 4. Greece. 5. Etruria and Rome. 6. The Early Christian style. 7. The Byzantine style. 8. Mahometan architecture. 9. The Romanesque style. 10. Gothic architecture. 11. The Renaissance.

I.

CELTIC OR DRUIDICAL REMAINS.

The Celtic race has left enduring marks of its power in the numerous monuments which are found in various parts of Great Britain, France, Germany, and Spain, and scattered through adjacent countries.

These consist of collections of huge uncarved boulders, arranged in geometrical lines, and often found in the centre of vast plains, far removed from quarry or mountain-side.

The more common forms are called “menhirs or peulvans,” signifying in Celtic “long stones.” These are either found separately or ranged in long parallel lines.

The most remarkable examples are at Carnac, in Brittany, where there are twelve hundred of these huge stones, varying from three to eighteen feet in height, ranged in eleven rows, leading to a semicircular enclosure.

What purpose they served, and whether of a religious or civil character, has not been conclusively determined. Some consider that they served to mark the burial-spot of the Druids; others that they were landmarks or emblems of victory.

To another class belong the so-called Rocking Stones, which consist of two immense blocks of rock, placed one upon the other, and either balanced so exactly that the slightest touch will suffice to shake them, or pivoted so as to revolve. There are examples at Tenanville, near Cherbourg, in the north of France, and in Sussex, England. One of these, called the “Great upon Little,” is estimated to weigh a million pounds.

Batissier considers them to have been erected by the priests, either to strike terror and wonder into the hearts of the people, whom they sought to hold in subjection, or as emblems of the world suspended in the air. We know that they have existed from remote ages, as mention is made of their antiquity by Pliny and Ptolemy.

Trilitha, or lichavens, are formed with three stones, two vertical and one horizontal resting upon the others, in the shape of a rude gateway. This is what they were probably intended for, though it has been suggested that they were used for altars. Similar to these are the dolmens, or table-stones, consisting of one large flat boulder supported by several smaller ones. Their upper surfaces, as a rule, have channels cut in them, which are generally believed to have been receptacles for the blood of victims sacrificed upon them, and some are even hollowed out in the shape of the human body.

The Merchants’ Tables, at Lochmariaker, are the most noted among the many that still exist.

From fragments of skeletons usually found in the vicinity of dolmens, it has been imagined that either the priests or their human offerings were buried there as upon consecrated ground.

There are several instances where these dolmens form covered ways or avenues, being placed one beside another in continuous line, and generally surrounded by a plantation of trees. They are frequently divided by blocks of stone into several compartments, and, like the tumuli or barrows, were probably used as places of interment for the dead.

The most interesting, perhaps, of any of these groups of stones are the “cromlechs”: enclosures formed of numerous boulders, arranged either in elliptic rows or in concentric circles, with a large monolith in the central point. Each circle is composed of a definite number of “menhirs,” and the whole is usually surrounded by a ditch.

It is supposed that each stone represented a minor deity, and the central one the chief of the gods. Their purpose apparently was to mark the place of large assemblies, called together for the administration of civil, military, and religious rites.

The cromlech of Stonehenge in Wiltshire is the most celebrated and one of the largest known. The country folk call it the Cor-Gaur, or dance of giants, and attribute its formation to the magic of the famous enchanter, Merlin. It is composed of two circular and two elliptic enclosures, the one within the other, and is several hundred feet in circumference.

In none of these Celtic monuments is there anything which may be called strictly architectural, but some of them illustrate a principle of building which is of importance to note. To place a row of stones in upright positions denotes no special phase of intelligent thought, beyond a desire to permanently mark some interesting locality, but when the ancient race which raised these massive rocks conceived the idea of supporting one block upon a number of smaller ones, it had reached a first principle of construction, destined to be employed for many centuries afterward in some of the finest buildings. After the trilithon came the table-stones, and from these it was but a step to the covered alleys, which were in themselves a first conception of a rude habitation, walled in and roofed over. There can be nothing more elementary than this, and no simpler constructional expedient, in whatever country it may first have been evolved. We do not know the precise date of Celtic monuments, nor is it probable that they are as ancient as the Egyptian pyramids, but as in any case they illustrate the transition from brutal ignorance to an era of thought, we may place them at the commencement of our chronological list. In the various themes and discussions advanced by archæologists, and the strange legends and tales of the peasantry with regard to them, we have no concern. It is sufficient for us to know that they exist and afford us an insight into the dawning efforts of a barbaric people to progress in the art which we propose to study.

II.

THE MONUMENTS OF EGYPT.

The history of Egypt is divided into five periods, from the earliest ages down to its conquest by the Romans at the beginning of the Christian era. The first period comprises the first fourteen dynasties of ancient kings, among whom the most important are: Menes, founder of Memphis, Shoofoo or Cheops, Shafra or Chephren, and Mycerinus, builders of the pyramids of Gizeh, and the two Theban monarchs, Osirtasen I. and Amenemha III., by whom the tombs at Beni Hassan, the Labyrinth and Lake Moeris were constructed. According to Bunsen these fourteen dynasties date from 3623 to 2547 B.C.

The second period is marked by the invasion of the Hyksos, or Shepherd Kings, of whom there were three dynasties. They remained in power until 1625 B.C. and were a warlike and destructive race, leaving no permanent traces of their occupation.

The third period is the most brilliant in Egyptian history, extending from 1625 to 525 B.C., and comprising nine dynasties of great conquerors and builders. The best known of these are: Amosis, Thothmes III., Sethi I., Rameses II. (the Great), called also Sesostris, and Rameses III. Under these kings the great temples of Luxor, Abydus, and Karnak were erected and the arts were assiduously cultivated.

The Persians under Cambyses occupied the country in the year 525 B.C. They were expelled a century later, but were again victorious in 340 B.C., and remained in possession until the conquest of Alexander the Great in 332. This fourth period was as unproductive in works of art as had been that of the Hyksos dominion.

After Alexander, the Ptolemys ruled until the close of the first century before Christ. Their government promoted the cultivation of the arts and industries and formed the fifth and last period in the history of ancient Egypt as an independent state.

Of these five epochs there are, therefore, only three—namely, the first, third, and fifth—during which architecture flourished, and these three in reality form but one long period in the history of an art which remained almost unaltered, scarcely either improving or receding, from the remotest times to its last day.

Our knowledge of ancient Egypt has been chiefly derived from bass-reliefs, mural paintings and hieroglyphics. The latter were unintelligible until the discovery of the Rosetta stone by the French consul Champollion, in 1798. This was part of a stone tablet bearing three inscriptions, one in hieroglyphics, one in the Cursive letters used by the lower classes, and the third in Greek. By means of this the old alphabet was reconstructed and all the ancient inscriptions deciphered.

TOMBS.

The most important monuments of the first period are the pyramids, the oldest of which were built between three and four thousand years before Christ.

There remain about a hundred of these in the vicinity of the ancient city of Memphis, extending over a considerable extent of country, and others are found in Thebes and at Meroë in Ethiopia. There have been many theories advanced upon the subject of their origin and purpose, and many arguments set forth seeking to prove that they were observatories, temples, granaries, meteorological monuments, or tombs. Nearly all modern authorities agree upon the last as the most probable solution of the problem, not only from the sarcophagi and mummies found within many of them, and from inscriptions relating events in the lives of important personages which adorn the walls of some of their inner chambers, but from the fact that these buildings are never found beyond the confines of cemeteries.

In erecting these monuments, the Egyptians usually selected a site upon a rocky plateau, on which a space equal to the superficial area required for the base was made level, a mound being left in the centre which was bonded in with the masonry. Below this platform a sepulchral chamber and connecting passage were hollowed in the rock. The pyramid was built over this chamber and contained one or more additional apartments, reached from the outside by narrow and inclined corridors. It was generally constructed with blocks of limestone, in successive steps receding at an angle varying from forty-five to seventy degrees. The outside was afterward cased with slabs of polished syenite, upon which inscriptions were engraved or painted. The interior chambers and corridors were likewise lined with polished granite, sometimes so mathematically jointed that a needle could not be pushed between the stones. Ceilings were formed by inclined slabs resting against each other or the walls were corbelled inward until they met.

The entrances to the passages were invariably closed and concealed, and portcullises of heavy granite blocks, sliding in grooves, were placed at intervals along the corridors, the more effectually to preserve the sepulchre from violation. Nearly all have, nevertheless, been entered and rifled, so that but little is left to aid the archæologist in his researches. Fragmentary inscriptions and local observations compared with the accounts given by Greek and Latin authors have, however, resulted in the piecing together of what may be presumed to be an accurate history of the pyramid-builders. The three largest pyramids are situated at Gizeh, a small village near Cairo, and are respectively those of Cheops, known also as Suphis or Shoofoo, Chephren or Shafra, and Mycerinus.

The following table shows the dimensions given by two of the best authorities:

SIDE OF BASE. PERPENDICULAR HEIGHT.

Sir G. Col. H. Sir G. Col. H. Wilkinson. Vyse. Wilkinson. Vyse. Cheops 756′ 764′ 480′ 9″ 480′ 9″ Chephren 707′ 9″ 453′ 454′ 3″ Mycerinus 364′ 6″ 208′

All of these are oriented and the entrances are all on the North sides. This is a rule applicable to all the pyramids except that of Sakkarah, which is placed without reference to the points of the compass and was probably erected at a much later date.

The first or Great Pyramid contains one subterranean chamber, reached by a passage some three hundred feet long, and two other apartments above the level of the ground, the one above the other, called the King’s and Queen’s sepulchres. The entrance to the connecting corridors is placed 45 feet above the ground and 23 feet away from the true centre in order to deceive explorers. The Queen’s Chamber is about 18 feet square by 20 feet in height, and is placed directly under the apex of the pyramid. It is 67 feet above the ground, and 71 feet below the King’s Chamber. The passage leading to the latter is 28 feet high, formed by corbelled walls. This chamber is roofed by a flat ceiling and measures 34 feet in length by 17 in breadth, and is 19 feet high. The walls and ceiling are built of finely polished granite, and the apartment contains a sarcophagus of the same material. The weight of the

superincumbent masonry is relieved by five other compartments placed over the chamber, four of which are covered by flat slabs, and the fifth by inclined stones resting against each other. It was in this highest compartment that some hieroglyphics scrawled in red ochre on the walls were discovered, by means of which the name Shoofoo became known. Herodotus says that one hundred thousand men were employed during twenty years in building the Great Pyramid, after they had devoted ten years, previous to its erection, to the construction of a causeway to the Nile, over which the stone was carried, which had been brought down the river from the Arabian hills.

Diodorus asserts that the number of workmen employed was upward of three hundred and sixty thousand.

The second pyramid contains two chambers, the most important of which is on the ground level, partly sunk in the rock. Its dimensions are 46 feet long by 16 in width, and 22 feet high. Within it a granite sarcophagus was found, containing the bones of an ox. This discovery gave rise to much speculation, as to whether the pyramids were not originally intended for the sepulchres of the animal deities worshipped by the Egyptians, the bull Apis in particular. The third pyramid was covered by a casing of polished red granite, formed of blocks with bevelled edges. There are several chambers inside, one of which contained a mummy and case, now transferred to the British Museum.

Near the pyramid of Cheops, on the same plateau, is the Sphinx. This great statue, with a human head and the body of a lion, is carved in the natural rock, deficiencies being made up by added masonry. Its dimensions are colossal, the body being 140 feet long, and the face 30 feet high by 14 feet in breadth. This mysterious creation was intended as the representation of a god, and as such had sacrifices offered before it, as the altars and temples erected beneath it attest. From inscriptions upon a stone found near by, it is known that the Sphinx was called Hor-em-khoo, “The Sun in his Resting-place.” The head was originally surmounted by a royal helmet, the face had a beard, fragments of which have been unearthed, and it is otherwise badly mutilated. This fanciful creature has doubtless much affinity with the winged bulls and lions of the Assyrian epoch.

The Egyptians also buried their dead in smaller tombs, in subterranean vaults, and in catacombs excavated in the rock of mountainous regions. A great number of these smaller tombs were built in the vicinity of ancient Memphis and are now commonly called “mastabahs.” In arrangement they were nearly all similar, the sepulchre consisting of three parts: a temple overground, a pit or well, and a subterranean chamber. The temple was in the shape of a frustum of a pyramid, the walls inclining inward at an angle of seventy degrees. It contained one or several apartments, used as places of assembly for the relatives and friends of the deceased, who came at stated intervals to hold services and to bring offerings of a suitable character. A list of these occasions was placed over the entrance, and on a second tablet or stella, inside, the name, titles, and virtues of the dead were recorded. The walls were brilliantly painted, domestic and religious scenes being the usual subjects depicted. The well-opening was usually concealed and filled with masonry. Its sides were formed of slabs of granite down to rock level and then excavated in the rock, sometimes thirty or forty yards below the surface. From the bottom of the pit a doorway, usually walled up, opened into a chamber containing a stone sarcophagus, in which the mummy was placed.

The finest excavated grottos are found at Beni Hassan and in the neighborhood of Thebes. Those at Beni Hassan follow the type of the “mastabah,” having the assembly hall, the well, and the chamber beneath, all being hollowed out of the rock. The sides are decorated with columns, architraves, and cornices, in imitation of constructive architecture, and the ceilings are cut out to represent vaults, the uncarved surfaces being adorned with paintings and hieroglyphics. The columns are especially interesting, as having evidently furnished the Greeks with the model for their Doric temples, and the order has in consequence been called the proto-doric. They have a diameter of five feet and are sixteen feet high; the shaft has sixteen sides with flutings and is surmounted by a tile or abacus. Besides these, there are other columns with capitals in the form of a lotus or papyrus bud, which are more commonly found in Egyptian temples.

The tombs of the kings at Thebes are arranged on a different principle; they consist of long sloping corridors opening into chambers and halls, and penetrating in a continuous line into the mountain rock. There are several groups, the most important of which is situated in the valley of Biban-el-Molook, or the “Gates of the Kings.” The tomb of Sethi I., the father of Rameses II., discovered by the explorer Belzoni in the earlier part of the century, is the finest example, the sculpture and paintings which it contains being very remarkable for their execution and of great historical interest, as they illustrate very completely the manners and customs of the ancient Egyptians. Every effort had evidently been made to conceal the tomb, for not only was the entrance closed and covered with loose rock, but the first chamber, reached by a succession of passages and steep staircases, had been walled up and the four sides painted, so as to have the appearance of being the limit of the extent of the tomb. The hollow sound, caused by hammering on the walls at one point, led the explorer to continue his efforts, which were rewarded by the discovery of several more halls and

chambers, terminating in a great vaulted chamber, thirty feet long, containing an alabaster sarcophagus. It has been conjectured that many of these excavated grottos were occupied as residences by the kings and great personages of the empire during their lifetime, and converted into sepulchres after death. The custom of relatives meeting at intervals in an assembly hall connected with the tomb does not seem to have prevailed here as at Memphis, but it is not improbable that the great Theban temples were used, if indeed they were not erected for this purpose.

The great mass of the people were not honoured by such magnificent tombs, but were buried in subterranean vaults in the necropolis (Greek, “city of the dead”) attached to each great town. The largest are those of Saïs, Sakkarah near Memphis, Thebes, and Abydus. These underground galleries were reached by deep wells, and often contained several stories of small chambers in which the embalmed bodies were placed, together with vases, statuettes, and other votive offerings. There were also cemeteries in which the animals worshipped by the Egyptians were buried, containing thousands of embalmed birds and reptiles, particularly the ibis and crocodile. The Apis mausoleum at Sakkarah, where the sacred bulls were interred, is one of the most important, the chambers and galleries being excavated in the rock and covering an immense area. The mausoleum was connected with the Serapeum, a temple above ground, where the living bull was worshipped as a deity.

TEMPLES.

There are two classes of Egyptian temples—those hollowed out of the mountain rock, commonly called speos, and those built upon the open plain and distinguished by the term “hypæthral” (Greek, “under air”). The most important of the latter are the temples of Sethi I., at Abydus; Amun re, at Kooneh; the great and small temples of Medeenet Haboo, erected by Rameses III. and Thothmes II.; the Rameseum or Memnonium, of Rameses II.; Luxor and Karnak, at Thebes; and the temples of Denderah, Edfou, and Philæ, built by the Ptolemys. All of these are similar in general plan, consisting of a greater or less number of courts, halls, and sanctuaries, which in each case are placed “en suite,” that is, one opening into the other in a continuous line, the larger apartments being in about the centre of this line and gradually diminishing in size, the last chamber being the smallest. As the main characteristics of the largest temples apply in a modified form to the smallest, a description of a complete temple would seem to be the best way of explaining the usual arrangements. A wall of crude brick usually enclosed the whole structure, which was surrounded by a sacred grove, or temenos. This wall was entered by an outer gate, or pylon, built in the shape of a frustum of a pyramid, and surmounted by a coved cornice, the doorway having perpendicular or slanting jambs. From this an avenue, or dromos, bordered with sphinxes with human or rams’ heads, led up to the propylæa, or towers. The latter resembled the outer pylons, but were on a larger scale, containing staircases leading to upper terraces. They were spaced a short distance apart to admit of a passage between them, which was entered through a second gateway similar to the first. The sides of these buildings were usually elaborately painted, and rings were inserted in the masonry to hold the poles upon which the royal banners were hoisted. This second entrance was often flanked by two obelisks—long tapering monoliths with pyramidal summits, covered with hieroglyphic inscriptions recounting the dedication of the temple by the king to his favorite divinity. These obelisks were sometimes ninety feet high, and mounted upon square blocks. They were not always of equal size, probably owing to the difficulty of obtaining single stones of such enormous length. It is of interest to note that their sides were made slightly convex in order to prevent their appearing concave, which would be the effect had they been left quite flat. A second set of towers, or propylæa, with staircases, came next, with a court or area intervening. On each side of this court a colonnade was generally placed; and sometimes before the entrance to the towers two colossal statues of the king, represented seated, with his hands resting upon his knees in the conventional attitude of repose. The most famous are those known as the Colossi of Memnon, which stand on the plain of Thebes. They were probably in the court of the temple of Amunoph III., of which scarcely any vestige now remains. They are fifty feet high, mounted upon pedestals. One of them is called the Vocal Memnon, as, in ancient times, it gave forth sounds at the break of day—a phenomenon more easily explained as a trick of the priests, than by natural causes.

Beyond this court there was usually an inner vestibule, with columns forming porticos on the four sides; those opposite the entrance being connected by stone screens, reaching half-way up, forming a shaded anteroom, or pronaos, to the great hall of assembly, which was the next apartment.

The shafts and capitals of the columns varied in different buildings. The plain cylinder, carrying an inverted bell decorated with palm or other smaller leaves, or a capital in the shape of the lotus flower were the commonest forms. A column, representing the stems of water-plants bound together with rings, and swelling out at the top in the place of the capital, was also often employed. Besides these, statues of kings, or shafts surmounted by the heads of Isis or Osiris, were used as supports. The architrave, or beam, did not rest directly upon the capital, but upon an intermediate block. This block, when on the heads of deities, was in the shape of a

miniature pylon. The cornices were formed of a deep cove and fillet decorated with winged asps.

Some idea of the size of these inner vestibules, or peristyles, may be formed from the dimensions of that in the great temple of Medeenet Haboo, which measures 123 by 133 feet, and has a height of 39 feet 4 inches. Each of the porticos of the East and West sides is supported by five columns; those on the North and South by eight Osiride pillars, having a circumference of 23 feet and a height of 24 feet.

The great hall of assembly, which adjoined the vestibule, was generally the finest portion of the temple. The architraves supporting the roof rested upon a great number of lofty columns, which in the centre rose to a greater height, in order to obtain a clerestory, by which the hall was lighted. The largest of these is in the temple of Karnak, measuring 170 by 329 feet. The central avenue consists of twelve columns, 62 feet high by 11 feet 6 inches in diameter. Besides these there are one hundred and twenty-two others, 42 feet 6 inches in height and 28 feet in circumference. The lintel over the doorway by which it is entered measured 40 feet in length. The sanctuary was contiguous to the great hall, and terminated the suite. This consisted of a chamber, either occupying the whole of the rear space, or isolated by corridors on each side, with smaller sanctuaries opposite. In many of these, altars and statues have been found, some of the former formed of a single block, hollowed at the top and pierced through from top to bottom, so that sacrifices placed upon them could be consumed apparently without ignition, by means of fires kindled in subterranean vaults.

In connection with the halls in the temple of Abydus and elsewhere there were a number of vaulted chambers; the vault not being formed of a series of true arches, that is, with joints radiating to a common centre, but consisting of stone beams placed one beside the other, and hollowed out on the under side. The arch, however, was not unknown to the Egyptians—there are stone vaulted tombs at Sakkarah of the time of Psammetichus (650 B.C.), and crude brick arches have been found at Thebes dating as far back as the period of the eighth dynasty (2925 B.C.?). The antiquity of the arch has been the subject of much debate, owing chiefly to the fact that the Greeks made no use of it; recent explorations have, however, shown that this constructive expedient was known both in Egypt and Assyria many years before it was adopted by the Etruscans, to whom its invention was long attributed.

The exterior walls of all temples were built on a batter, sloping inward at an angle of about seventy degrees and with scarcely any openings. The inside walls were perpendicular, and decorated with bass-reliefs and paintings. These were often of a most elaborate character, and it is from them that so much has been learned concerning the ancient history of the country.

The rock-cut temples of Nubia are laid out on much the same plan. They usually consist of a pronaos, naos, and sanctuary, forming a suite, with an entrance marked by colossal statuary hewn out of the side of the cliff. Some have a dromos of sphinxes, propylæa, and a peristyle court of masonry preceding the excavated portions. The temple of Wady Sabooah is the best example of the latter. Of the former none can compare with the Great and Small temples of Aboo Simbel, or Ipsambool, which are of the time of Rameses the Great.

The smaller of the two is dedicated to the goddess Athor, the Venus of the Egyptians. The exterior is ornamented with six statues of deities recessed in the rock, each measuring thirty-five feet in height. In the interior there is a first hall, supported by square pillars, opening into a corridor, flanked by smaller halls, leading to the sanctuary.

The front of the Great temple is adorned with four statues of the king seated upon his throne, each sixty feet high. In the great hall there are eight Osiride pillars, upward of thirty feet in height. The sides of the speos are carved with bass-reliefs, representing the conquests of Rameses the Great. There are some sixteen smaller chambers, the suite terminating in the sanctuary, which contains an altar and four statues—the three deities, Amun re, Phre, and Phtah, with the king seated in their company.

Under the headings tombs and temples are comprised the chief architectural works of the Egyptians. Besides these there were one or two gigantic constructions, famous in antiquity, but which have now almost disappeared. Of these, the Labyrinth and the Lake Moeris were the most important. The former appears to have been an immense structure, half palace, half tomb, built by Amenemha III., of the twelfth dynasty. It was built on three sides of an open square, measuring about five hundred feet on the side, consisting of numerous chambers and courts, in two stories, one above and the other below the level of the ground. At the open end was placed a large pyramid, of which the ruins still remain. Herodotus admired the Labyrinth more than any other of the Egyptian buildings, declaring it to surpass the pyramids in labour and expense. Near by was the artificial Lake Moeris, formed to retain the Nile waters during the inundation, for the purpose of irrigating the country surrounding Memphis, during the dry season. It covered an immense area; tradition says 450 miles in circumference. The banks were fortified with massive masonry, and the waters distributed by means of locks and sluices.

The Egyptians appear as a civilized nation, having a scientific, artistic, and political knowledge of no mean order, at a time when the greater part of the world's inhabitants were but a step removed from the level of ignorant savages, and when, according to a generally accepted chronology, the world itself had existed but a few hundred years. The construction of the Pyramids reveals a building capacity which has rarely been rivalled, requiring not only immense mechanical power, but an accuracy of judgment and calculation in the adjustment of blocks of granite weighing many tons, not simply piled one above the other, but perfectly jointed and polished, and so disposed that passages and chambers were roofed over and their ceilings relieved from superincumbent weight by ingeniously contrived compartments, one above the other, and closed by sliding doors of monolithic stones, the handling of which could only have been successful by people well versed in the theories of equilibrium and support; and yet all this was done at a date which the best authorities agree in saying could not have been later than three thousand years before Christ. Their temples show an equally advanced erudition, and the paintings and hieroglyphics with which the walls of these buildings are adorned give a faithful representation of the customs of a people acquainted with the minor arts and sciences and the appliances requisite for agriculture.

The admiration with which we may regard the excellence of so ancient an art is tempered when we find that it contained no element of progress. The monuments of the eighteenth dynasty, though numerous and imposing, scarcely differ from those of the preceding period, and even in the days of the Ptolemys, who encouraged the native art, there was nothing attempted but a repetition of the old methods. From beginning to end the arts were so fettered by conventionality and dogmatic laws, opposed to originality or change, that the only improvements made were in mere mechanical execution.

A great prevailing thought seems to have actuated this people,—that of death and eternity. Their aim in erecting their buildings was to render them quasi-eternal, and by embalming the bodies of the dead they even sought to perpetuate the semblance of life. Their kings at the beginning of their reigns commenced the construction of their own sepulchres, employing hundreds of workmen and immense expenditure of the national funds for the purpose, and countless thousands passed their lives in hollowing temples in the mountain rock and in carrying huge blocks from great distances for the building of the pylons and hypostylic halls of the Nile, in which durability and massiveness were considered all-important.

Egyptian architecture, simply from the enormous scale of everything it produced, was always dignified and it had also the merit of severe simplicity; but mere size can scarcely be rated as an artistic quality of a high order, and on that account it cannot compare favourably with the art of the Greeks, who were probably inspired by what they saw in Egypt, but who, in their own work, succeeded in combining the qualities of majesty and beauty without resorting to the use of extraordinary materials.

III.

ASIATIC ARCHITECTURE.

It would, perhaps, be reasonable to suppose that in India, where the Aryan race had its origin, the earliest traces of dawning art would be found. It has, however, been fairly well established that all remnants of very ancient art, which may have existed there in former times, have now virtually disappeared, and that at present there are no remains in Hindostan of a remoter antiquity than the second or third century before the Christian era.

The architecture of India loses much of its interest for us from the fact of its having had no influence upon the origin or development of the European styles of building, which, starting in Egypt and Assyria, formed a continuous chain, each linked with its predecessor and successor down to modern times.

The Indians were, in fact, never a migratory or colonizing race of people, and their architecture was a distinctly native production, executed in accordance with the rules laid down by the priests in their sacred books, having no affinity with the constructive principles of the Western world and showing no trace of the arts practised by Western nations, except in the slight resemblance of a few mouldings and fragments of sculpture.

The chief structures of the country are temples, pagodas, and dagobas, which are found in many different parts of the peninsular and adjacent islands, resembling each other in general style, but with some local peculiarities which have caused them to be usually classified in certain comprehensive divisions, of which the following are the most important:

The Buddhist style, including the stambhas or lats, a species of commemorative pillar, the stupas or topes, of which the best examples are found at Sarnath and Manikyala, and the viharas of Bengal.

The Dravidian style, exemplified in the temples of Chidambaram, Tanjore, Combaconum, and Madura, and the rock-cut temples of Mahavellipore, and those known as the Kylas at Ellora.

The Indo-Aryan, or Northern, comprising the temples of Kanaruc, Bhuwaneswur, Jajepur, and Cuttack, in the province of Orissa.

The stupas, or dagobas, were a form of structure specially erected for the purposes of Buddhist worship. They were sometimes built in the shape of a square tower upon rising ground, of which that at Sarnath, north of Benares, is the best known. The more important, however, are cylindrical and surmounted by a semicircular dome. These are usually erected on artificial mounds or tumuli, and are constructed either with jointed stones or with rough blocks bedded in cement. The interiors are of solid masonry, with the exception of a small square chamber, used as a repository for sacred emblems, the walls of which are continued up to the top of the dome. The stupa at Manikyala, is of great size, being upward of eighty feet in height, and measuring some three hundred feet in circumference. The base of the building is in the form of a cylinder, six or seven feet high, supporting an attic decorated with pilasters; above this the walls recede, and are capped by a hemispherical dome. There are a great number of dagobas in Ceylon, in the mountainous districts. They are usually placed in a walled enclosure, and surrounded by commemorative pillars. Smaller constructions of the same description are found in the interior of some of the temples, being placed where the baldachins, or altars, would be placed in Christian edifices.

The rock temples of India are of two classes, the one consisting of grottos hollowed in the mountain side, and the other of a series of monolithic buildings cut bodily out of the solid rock, and detached from the surrounding hill plateaus by wide excavated areas.

The former, resembling the speos of Egypt, consists of long galleries, divided into aisles by piers of the natural rock left at regular intervals to sustain the superincumbent mass. A recess or sanctuary is placed at one extremity, containing the statue of the divinity to whom the temple is dedicated. In some cases the interior is terminated by a semicircular apse with a hemispherical vault, and the entrance preceded by a vestibule containing votive figures, the whole forming a plan very similar to that of the Latin basilicas, which will be described in a subsequent chapter. The grottos are frequently excavated in several stories and connected by corridors and ramps.

The walls or sides are ornamented with rude sculptures, representing various forms of animal life and monstrous creations of native fancy. The piers or pillars are generally either square or octagonal, decorated with mouldings and flutings, and having well defined capitals and bases. The capitals usually support a stone beam or bracket, evidently in imitation of those used in wooden construction, in which a similar expedient would be employed to distribute the sustaining power over a wider surface than that directly above the column or post. This imitation of wooden forms, which we have already noticed in Egypt, is found universally in all ancient constructions showing that in nearly every country wooden architecture was employed before stone.

The group known as the Kylas of Ellora, is the finest example of the temples fashioned both inside and outside from the solid rock.

The whole edifice is monolithic and situated in an oblong court formed by a trench excavated “vivo saxo” on the four sides. The exterior surfaces are richly carved, and the piers shaped to represent elephants, lions, and fantastic creatures supporting the superstructure on their backs. The court is entered from a monumental porch, the upper story of which is connected with a small chapel by a bridge. This chapel is flanked by two colossal elephants, and by two columns or towers standing isolated on either side. A second bridge leads from this to the hall of Shiva, the chief room in the suite, which is divided by sixteen columns, with corresponding pilasters on the walls. At the farther extremity is the sanctuary containing the statue of the presiding divinity. Beyond this are open terraces, surrounded by chapels. The great hall is connected laterally with subterranean chambers in the surrounding cliffs, reached also from excavated corridors which follow the perimeter of the court, the mass above being sustained by square piers spaced at short distances apart.

The inside walls are decorated with bass-reliefs and the ceilings ornamented with stucco relievos, which were originally brilliantly painted. The height of the hall of Shiva is about fifty feet, the hillside opposite to it being about ninety feet high.

These temples may be said to be the most remarkable and unique architectural productions to be found anywhere. They are examples of long-continued perseverance and patience, and can only be the result of a preconceived design which must have been thoroughly studied in all its elaborate detail before the first stroke was given toward its realization. The unity of conception and execution exhibited in such works is truly wonderful, and it is not astonishing that the superstitious natives should attribute their creation to Visvakarma, the heavenly architect. On the other hand, there are but few practical lessons to be learned from their examination. Such methods are not possible in our day, nor if so, would they be desirable. Architecture of this kind is scarcely more

than wholesale sculpture, and as such can in no sense compare favourably with the grace of form and scientific construction which we see in the works of Greek and Gothic artists.

The Pagodas are the most important of the buildings constructed with jointed materials. They consist of vast enclosures containing numerous religious and domestic edifices. There are often double or triple series of enclosing walls of great height and thickness. The sides are usually placed so as to face the points of the compass and each contains a monumental entrance, richly sculptured, and adorned with bands of embossed copper.

The chief buildings within are the temple proper, or vimana, and a number of hypostylic halls with small sanctuaries dedicated to different divinities.

The form of the vimana differs in the North and South of India. In both cases it is pyramidal, but while in the Southern temples the plan is rectangular and the elevations marked by a series of horizontal stories and mouldings, in the North the exterior surfaces are convex and the outlines curved, showing vertical instead of horizontal divisions. The lower story, containing the idol, is usually a hollow cube of granite, and serves as a base to the pyramid above, which is most frequently built of brick with stucco facing.

The halls are composed of a great number of columns of varied design, placed in parallel rows. The ceilings are formed by stone beams or slabs resting upon the columns. The central aisle is frequently wider than the others and is roofed over by a corbelled vault.

A tank of sacred water surrounded by an open colonnade is not uncommonly placed within the enclosure, the waters being used by the infirm for the healing properties which they are supposed to contain.

The pagodas of Tanjore, Combaconum, and Madura are among the finest and most celebrated. They were built between the fifth and eleventh centuries of the Christian era, and should hardly, therefore, be described among the ancient buildings of the world, were it not that they are linked in with the chain of the older Indian art too closely to be separated from it.

In the period corresponding to the Middle Ages of Europe, Mahometan architecture was introduced in India and many beautiful buildings were erected in a new style blending the foreign art with the native ideas and taste, but offering a marked contrast to that which preceded it. Although China was one of the oldest of civilized countries it contains but few monuments of great antiquity. The temples and palaces, being built of wood, were exposed to fire and decay, and were often pulled down and rebuilt. With the exception of the great wall and of the numerous bridges crossing rivers or arms of the sea, there are no important stone constructions to be found there.

The latter are formed of huge granite piers, spanned by massive stone lintels, requiring the united labour of thousands of men to convey them from the quarries to their destination and to set them in place. In the mountains the ravines are bridged by iron chains suspended from cliff to cliff.

The great wall was built as a frontier protection, and extended the entire length of the boundaries of the country. It has always been kept in repair, although obviously absurd as a fortification in modern times. It is of great thickness, and upward of twenty feet in height. The foundations are of stone, and the upper part of brick with stone facing, the joints of which are extremely accurate. At short intervals there are towers, placed so that the middle distance between any two is within arrow-shot.

Chinese wooden buildings are all much alike, whether temples or palaces. As a rule, they have but one or two stories; they are surrounded by porticos, consisting of wooden columns mounted on stone bases, without capitals, which are replaced by a species of bracket. The roofs project considerably, and their angles are turned up, this form being undoubtedly borrowed from the old tent habitations, which were composed of hides stretched tightly on bamboos. The tiles with which they are covered are semicylindrical in shape and are enamelled with bright colour.

The celebrated taas, or Buddhist towers, are of similar construction. They are generally octagonal, and from six to ten stories high. Each story is set back from the one below, and has a balcony and projecting roof, with bells hung in the angles. The walls are covered with tiles or paintings. A high staff is placed on the top and connected with angles of the roof by chains.

The tower of Nankin, known as the Porcelain Tower, was the most famous. It was erected in 1431, and but recently destroyed.

The Chinese have always excelled in artificial or landscape gardening. In this work they build airy bridges, with open-work balustrades, pavilions highly ornamented and enriched with painting and gilding, and boundary walls with circular openings,

disclosing vistas of great beauty.

Their commemorative gateways are of interest, as they have a central opening and a smaller one on each side, like the Roman triumphal arches; the heads are square, however, with brackets in the corners. The upper parts are ornamented with figures in relief and inscriptions recording the virtues of persons to whose memory they are dedicated. Although communication existed between China and the countries bordering upon the Mediterranean from remote ages, Chinese architecture, like the Indian, was without influence upon that of Europe. It is only in Western Asia that the first forms of building are discernible, which were subsequently imitated or followed in European constructions. The most important of these are situated in Mesopotamia, the fertile region comprised between the Tigris and the Euphrates.

The political histories of Assyria, Babylon, and Persia are generally treated separately, but the architecture of each belongs to one style, which may be called the Assyrian, for its distinguishing characteristics remain the same in all the great cities which were in turn the capitals of reconstructed kingdoms and empires.

It may be considered in four chronological divisions: In ancient Babylon, from 2234 B.C. to 1520 B.C., at Wurka and Mugheyr; in Nineveh, from the fourteenth to the seventh century B.C., at Nimrod, Khorsabad, and Koyoundjik; in the second Babylon, during the seventh century and after the capture of the latter by Cyrus in the year 538 B.C., in Persia, at Persepolis, Passargadæ, and Susa. A renaissance of the art may be traced in Sassanian buildings erected eight centuries later.

The citadels, palaces, and other important structures of these cities were usually built upon artificial mounds or terraces, strengthened by massive walls. The materials used were bituminous bricks, cemented with bitumen, slabs of gypsum anchored with copper nails and bands, and timber for roofs and columns. Stone and gypsum or alabaster were employed in Nineveh and in the cities of Persia. In Babylon the only available material was bituminous clay, and consequently all the buildings there were built of brick. At the present day nothing remains of these but irregular mounds, from which but little can be gathered toward an understanding of what their appearance was when entire.

Wood was probably used to a great extent, and was naturally most easily destroyed by the fire of invading armies. The roofs, formed of thick layers of earth carried on beams, in falling in, buried the lower portions of buildings, and it is probably due to this fact that the bass-reliefs have been preserved.

The surfaces of the bricks were frequently enamelled in colours, and the wood-work was probably brilliantly painted, as traces of pigments have been found upon the more durable materials.

But little was known of Assyrian art prior to 1843, when the excavations of Botta, the French consul at Mosul, followed soon after by those conducted by Layard, brought to light many ruined buildings, in which bass-reliefs, inscribed stones and metals, and other important relics were found, enabling historians to form a consecutive account of the government, warfare, and arts practised by a people whose cities have lain buried and whose very name has almost been forgotten for over two thousand years.

The explorations were made in Nimrod, Koyoundjik, and Khorsabad. The palace of Asshur-bani-pal, erected at Nimrod, in the ninth century B.C., is situated upon a terrace, or platform, approached by a wide staircase, and preceded by two gates decorated with winged bulls.

These winged bulls, or lions, were placed as the guardian deities, at the portals of all the great Assyrian palaces, after the manner of the Egyptian sphinxes, not standing isolated like these, however, but built into the masonry, one side or the front and one side only, being carved. The head was human, with long beard and hair, and surmounted by a helmet, the wings large and proportioned to the body. As Sir Henry Layard remarks, it would have been difficult to find more fitting symbols to express at once the wisdom, power, and ubiquity of a supreme being.

The chief apartments of the palace are a large assembly hall, 152 feet in length by 30 feet in width, and a number of smaller chambers and banqueting-halls, ranged around an open court. The walls of the great hall were decorated with bass-reliefs, representing triumphal processions, carved upon slabs of gypsum eight feet in height.

The palace of Esarhaddon, erected in the seventh century, on the same terrace, contains a large hall, 165 by 62 feet, divided in its length by a wall, surmounted by a gallery of columns. One of the only well-preserved ramps which has been discovered was that leading to this palace.

At Koyoundjik, opposite Mosul, the palace of Sennacherib was found at the Southwest corner of a mound a mile and a half in circumference. It contained a vast number of courts and halls, decorated with bass-reliefs and winged bulls, and two colossal statues.

The palace of Sargon at Khorsabad, erected in the year 704 B.C., is among the best preserved. Like the others it is placed upon an artificial terrace, enclosed by a wall a mile long on each side. It was defended by a citadel of eight towers with doors flanked by winged bulls. The palace was reached by a long, narrow passage leading to a court and entered through three great gates. The bulls of the central portal were 19 feet high. On each side were two bulls, 13 feet high, with the figure of a giant strangling a lion between them.

The halls and chambers were grouped around two great courts measuring about 350 by 200 feet. The hareem formed a separate set of buildings, as did also the stables and outhouses. The walls were of great thickness, evidently for coolness. They were decorated with slabs of alabaster, enamelled tiles, and designs painted on stucco.

There has been much speculation on the method of roofing these rooms, some believing that circular vaults were employed and others that wooden beams, supported on wooden columns, similar to the stone ones found in Persian palaces, were used for this purpose. The latter theory seems the more probable, as the local manner of building is the same as this at the present day. No traces of columns remain, however, and the spans are in many cases too great to be roofed by single pieces of timber. One of the most interesting discoveries made at Khorsabad was the gate of the city, the jambs supporting a semicircular arch over a span of eighteen feet. The gate was a double one having two separate passages, one for vehicles and the other for pedestrians: the marks of chariot-wheels still remaining in the pavement of the former. The sides were ornamented with winged bulls, and the archivolts of the arches were decorated with blue and yellow designs in enamelled tiles.

It had been long supposed that the Etruscans were the first to make use of the true semicircular arch (_i.e._, formed of wedge-shaped stones or bricks, with joints radiating to a common centre), but this discovery, and the finding of pointed arches in the sewers of Babylon, by Layard, places the date when both these expedients were known, at a much remoter period, though even these are probably much later than the examples found in Egypt.

No complete example of a Chaldean temple has been found, but there are several the lower stories of which are sufficiently well preserved to give an accurate idea of their size and details, and in the tomb of Cyrus at Passagardæ, in Persia, we have probably a model on a small scale of one of these buildings when entire. This tomb consists of a platform of six steps, eighteen feet high, surmounted by a rectangular chamber. The latter has a doorway and a ridged roof abutting against pediments.

It has been surmised that all the temples were like this, consisting of a chamber or cella built on the summit of a several-storied structure, each story being either concentric and reached by a ramp winding around the four sides or placed farther to one side than that immediately below it and approached by straight flights of stairs.

The oldest is probably that at Wurka, dating as far back as 2000 B.C., known as the Bowariyeh. There are the remains of two stories, the lower occupying about 200 square feet. It is probable that a third story or a cella was placed above these, but nothing positive can be said on the subject, owing to the extremely ruinous condition of the building. The temple of Birs Nimroud, probably identical with the tower of Babel, is in a more satisfactory condition, the upper story having been preserved by a process of vitrification. The lowest story occupies a square measuring 272 feet on the side, each of the upper ones, of which it is supposed there were originally six, being 42 feet less.

For the materials used in its construction we have the scriptural authority: “Go to, let us make brick and burn them thoroughly. And they had brick for stone, and slime had they for mortar” (Gen. xi.); slime being probably bitumen.

M. Place discovered the remains of a tower at Khorsabad, with a winding ramp, which he thinks was originally seven stories in height. The walls were strengthened with buttresses and decorated with sunken panels, and from traces of colour found upon them it has been supposed that each floor was painted in a different hue. The area covered by the base is about one hundred and fifty square feet, and the total height was probably one hundred and thirty-five feet.

The ruins of Persepolis are the best preserved of the ancient Persian buildings, those at Susa and Passagardæ being in too bad a condition to offer much that is interesting.

They are situated in the plain of Mardacht, upon a terrace partly formed of masonry, and partly cut in the rock of the adjoining range of hills. The wall is composed of huge blocks of stone fitted together without mortar, but with the finest of joints. The terrace is reached by a splendid double flight of steps, upward of twenty feet in width, and on a grade easy enough to permit of the passage of long processions without interruption. At the head of the stairs is a propylæum, or outer gate, flanked by colossal human-headed bulls. Beyond this, a second staircase, ornamented with a triple row of bass-reliefs, gives access to the Chehil Minar, or great hall of Xerxes.

This building occupies a rectangle about three hundred and fifty feet long by three hundred in width. It consists chiefly of a central hall and three lateral porticos, the roofs of which were sustained by 72 columns, 36 in the hall and 12 in each of the porches.

Thirteen of these are still standing, and the position of all the others is well defined by broken bases or shafts. They are of two different kinds, the one having a capital composed of double-headed bulls, and the other a capital with volutes, not placed horizontally as we see them in classical columns, but vertically and resting on a complicated series of mouldings. These last may have been also surmounted by the double-headed bulls, as without such an addition the columns are shorter than the others, which measure 67 feet 4 inches. The beams which they sustained, rested upon the body of the bull between the two heads.

The shafts of the columns at Persepolis are fluted and taper upward from the bases, which are elaborately ornamented with mouldings.

It is probable that the Greek Ionic capital was derived directly from the Persian voluted model, as the order originated in the Greek colony in Asia Minor.

The Chehil Minar is the finest building on the platform, the other halls of Darius and Xerxes being smaller, and though a hall containing 100 columns has been found, it is inferior in height, the total altitude not exceeding twenty-five feet.

The hall of Darius contained sixteen columns, forming a square, preceded by a portico with eight more. The walls have long since disappeared, but the façade of the building is reproduced upon the face of the rock-cut tomb of Darius in the neighbouring hill called Naksh-i-Rustam, so that a restoration of the structure as it originally appeared is easily made.

This tomb shows the four front columns of the porch with double-headed capitals, sustaining an entablature, above this is placed an attic decorated with bass-reliefs and a figure is represented standing on the top in the act of sacrificing on an altar.

The stone buildings of Persia are generally supposed to be reproductions of the wooden constructions of Assyria, as the character of the art is similar in both, the bass-reliefs and winged bulls of Persepolis being practically identical with those of Nineveh.

We find no traces of Assyrian art for several centuries after the erection of the buildings just described, though it is probable that it had influence in all Eastern edifices erected during the interval, not only in Asia, but in Greece and later in Byzance. There was evidently a revival of Assyrian taste during the dynasty of Sassanian kings who reigned between the third and seventh centuries of our era. The remnants of their palaces are found at Firouzabad, Al Hadhr, Serbistan, Ctesiphon, and Mashita, where we find large halls vaulted and domed and ornamented in a manner directly traceable to the ancient buildings in Assyria. The chief peculiarity of these structures lies in the use of the horseshoe or elliptical arch, which is found nowhere else. The porch of the Tak-Kesra at Ctesiphon consists of a great elliptical tunnel-vault, 115 feet deep, 85 feet high, over a span of 72 feet.

There is more or less Roman influence in the details of the Sassanian palaces, but it is not altogether certain whether the knowledge of domical construction which they exhibit was derived from, or was not itself parent to, Byzantine art.

Comparatively little is known concerning this Assyrian style, but it contains interesting elements, and it may be that its constructive forms are susceptible of a greater development in our own time.

Asia Minor, Palestine, and Cyprus are fields covered with the evidences of the glory of past ages, but the ruin and desolation everywhere is complete. The case of the temple of Jerusalem, where not one stone remains upon another, applies in most instances in places which have formerly been great cities, filled with magnificent buildings which were their pride in the day of their prosperity.

The temple of Solomon was situated upon Mount Moriah, and was built to accommodate the Levites, to offer a place of assembly for the people, and as a temple for the worship of the priests. The two sanctuaries were richly decorated with polished cedar and gold, with columns and cornices of bronze, and divided by linen curtains embroidered with purple and scarlet.

The peculiar formation of the hill upon which it was built, required immense walls of the most substantial character to be raised from the valley below to enlarge its summit, so as to afford sufficient space for the erection of the various courts. “It was built of stone, made ready before it was brought thither; so that there was neither hammer, nor axe, nor any tool of iron heard in the house while it was in building” (2 Kings vi., 7).

The temple itself is supposed to have been 60 cubits long, the porch 20 cubits, the Holy place 20 cubits; the width was 20 cubits and the height 30 cubits. The porch, however, was 120 cubits high. (The cubit is estimated to equal from 10 to 20 inches.)

The temple underwent several profanations, and at last was utterly destroyed in the reign of Jedekiah by Nebuchadnezzar, 580 B.C. After laying in ruins 42 years, the foundation of the second temple was laid by Zerubbabel and in breadth and height was double that of Solomon’s. This second temple was plundered and profaned by Antiochus Epiphanes, and afterward rebuilt by Herod. It was considerably larger than its predecessor and was made of marble and of the most costly workmanship. It became the admiration and envy of the world, but, as our Lord predicted (Mark xiii., 2), it was completely demolished by Titus, A.D. 70.

Many restorations of the temples of the Greek colonists in Ionia have been attempted, but they are based on historical descriptions, inscriptions on coins, and other uncertain records, and are too conjectural to be accepted as accurate. There are, in fact, but few architectural remains sufficiently well preserved to be of interest to the architect, excepting the temples at Baalbek and Palmyra which are of the Roman period.

There are several groups of tombs, the most important being in Lycia.

These are of interest, as they illustrate more completely the transition between wooden and stone building than any other examples. There are two kinds, the one consisting of sarcophagi standing isolated, and the other of excavations in the mountain-sides. The former are composed of a stylobate or pedestal, serving as a base to a coffer ornamented with uprights and cross-pieces and panelled doors imitating exactly a wooden original. The roofs are curved, having in section the form of a pointed arch, being probably the earliest instances of its employment as a decorative feature.

The tombs cut in the face of the rock are of a similar description, having the same carpentry framework. The upper parts are terminated by a low pediment or by a row of stone logs supporting a horizontal moulding.

Later on during the Greek occupation, these wooden forms were abandoned and replaced by porticos of the Ionic order.

In various parts of Asia Minor, there are remains of tombs similar to these erected by the Pelasgi and Etruscans, which will be described in another chapter.

IV.

GREECE.

The oldest architectural works in Greece are those erected by the Cyclopes or Pelasgi, a race who came originally from Lycia, and moved gradually Westward, peopling successively the islands of the Grecian Archipelago, the Peloponnesus, Sicily, and Italy. At Tiryns and Mycenæ, in the province of Argolis, are to be seen the most remarkable remains of the buildings of this people, which were always grouped together in walled cities, serving as strongholds to protect the inhabitants of the province from the wild tribes with whom they came in contact. These cities were generally placed upon a rocky eminence, difficult of access and commanding a view of the surrounding country.

There are remains of high walls at Tiryns built of huge stones extracted from a neighbouring quarry and put together without cement or mortar, the interstices being filled with smaller stones. From the fallen blocks lying scattered at their base it is estimated that they originally measured sixty feet in height. At intervals these walls are pierced by triangular doors and windows, the sides of which are curved, forming arches obtained by corbelled or overlapping instead of wedged stones. These Cyclopean constructions date from the seventeenth century before Christ.

The Acropolis of Mycenæ is entered by a doorway formed of two vertical monoliths of great size supporting a lintel, and called the Gate of the Lions, from the carving above, representing two rampant lions separated by an engaged column.

This city was surrounded by high fortified walls, and contained a place of assembly for the people and rude habitations, the remains of which are still visible. There is also still to be seen a conical or bee-hive-like structure, commonly called the Treasury of Atreus.

This cone is formed by overlapping stones, curving gradually until they meet at the top of the vault, which is capped by a large block. The doorway by which it is entered is composed of slanting jambs of stone, sustaining a massive lintel. This lintel is relieved from direct weight above by a triangular opening, obtained by a similar process of corbelling. The Cyclopean remains are of interest to architects chiefly on account of this system of corbelled vaulting employed in their construction, which would never have been adopted had their builders been acquainted with the voussoir principle.

Dr. Schliemann has recently excavated the Acropolis of Mycenæ, and found there many interesting objects of gold and pottery. Bronze nails with flat heads have also been found within the Treasury of Atreus, which were evidently used to attach copper plates with which the interior was lined. Pausanias speaks of a similar treasury belonging to King Minyas, at Orchomenos, and other remains of the same description have been discovered in different parts of the Morea, bearing a resemblance to the ruined cities of Etruria.

In fact, the various tumuli found in Western Europe, Sardinia, Sicily, Greece, and Asia are all of the same type, and were a form commonly adopted by the ancient nations.

When we come to the epoch preceding Roman architecture, we will examine the character of Etruscan buildings, which were similar in many respects to the works of the Pelasgi; at present the subject of most interest is that of the great century of Greek art, for it marks the transition from Crude Art, to which belongs all that has preceded, to Fine Art, in which the Greeks excelled.

Greek buildings were erected according to the rules of three systems or orders, of the origin and character of which Vitruvius gives the following account, which, if not strictly accurate, is at least as reasonable as some of the versions which have been advanced. “Dorus, King of the Peloponnesus, having had a temple erected to Juno, in Argos, it was built by chance in the manner which we call Doric; afterward, in several other towns, other temples were built in this same order, having no established rule for the proportions of their architecture. About the same period the Athenians established several colonies in Asia Minor under the guidance of Ion, and they called the country which he occupied Ionia. These colonists built Doric temples there at first, of which the chief was that of Apollo, but as they did not know what proportion to give to the columns, they sought the means of making them at once strong enough to sustain the building, and of rendering them at the same time agreeable to the eye. For this they took the measure of a man’s foot as the sixth part of his height, and on this measure formed their column, giving it six diameters.[1]

[1] We have already seen that there are columns at Beni Hassan, in Egypt, resembling so closely the Greek Doric, that it is reasonable to suppose that the Greeks borrowed their conception of the order from the Egyptians and refined it.

“Some time afterward, wishing to build a temple to Diana, they endeavoured to find a new method, equally beautiful and more appropriate to their purpose. They imitated the delicacy of a woman’s form; they heightened the columns, gave them a base like the twisted cords which bind a sandal; they carved volutes in the capital to represent that portion of the hair which falls to the right and left of the head; they put circles and rings on the columns to imitate the rest of the hair which is braided and caught up on the back of women’s heads; and by flutings they imitated the folds of the dress. And this order, invented by the Ionians, took the name of Ionic.

“The Corinthian column represents the delicacy of a young girl, at the age when the figure is slender and best suited to the display of ornaments which may add to her natural beauty. The invention of its capital is due to the following incident: A young girl of Corinth, who was about to marry, having died, her nurse placed some little vases which she had been fond of during her life, in a basket on her tomb, and, in order that the weather should not spoil them, she placed a tile on the basket. This, having been laid accidentally over an acanthus-root, it came to pass, when the leaves began to grow, that the stems of the plant crept up the sides of the basket and, meeting the corners of the tile, were forced to curve downward, and to take the form of volutes. Callimachus, a sculptor and architect, struck by the harmonious result, imitated it in the capitals of columns which he subsequently made in Corinth, establishing on this model the proportions of the Corinthian order.”

[Illustration:

DORIC. IONIC. CORINTHIAN.

THE GREEK ORDERS.]

At this stage it is necessary to explain briefly that an order consists of a column, the pedestal upon which it stands, and the entablature, or top member, which it supports. The column is subdivided into the capital, or head; the shaft, or body; and the base,

or foot. The entablature has likewise three divisions: the architrave, or beam sustained by the columns; the frieze, or space occupied by the cross-beams; and the cornice, or line of stone marking the extremity of the rafters. These were originally made of wood and subsequently imitated in stone.[2]

[2] Viollet le Duc maintained that the Greek buildings were in no sense an imitation of wooden constructions, but gave no very satisfactory explanation of the origin of their component parts. It is perhaps best to conclude that they were adaptations of pre-existing edifices to new materials.

The Greek Doric column had no base and rested upon a series of steps in place of the pedestal. The ends of the cross-beams were marked upon the frieze by a projection, upon which were cut three grooves into which the rain-water ran and fell in drops to the ground. These drops were represented in stone underneath, completing an ornament which was called a triglyph (meaning in Greek, three grooves). The spaces intervening between the triglyphs were called metopes. The inclination of the sides of the roof formed the lines of the triangular termination which we call the pediment.

The Greeks employed three methods in their Doric, namely, the hexametric, heptametric, and octometric, that is, a proportion of six, seven, and eight diameters to the height.

We have seen what were the component parts of the Ionic and Corinthian orders in the quotation from Vitruvius.

In Greek temples the shafts of the columns not only tapered considerably, but the vertical lines of an entire building inclined to imaginary points determined by the intersection of lines following the inclination of the end columns. The mass was thus in the form of the frustum of a pyramid, being intentionally so designed to bind the parts of the building together in a manner to withstand effectually the oscillation caused by earthquakes, which occur frequently in this region.

The city of Athens contained numerous examples of each of these orders, and a brief account of the buildings of that city will be the best means of showing their principal characteristics.

The city proper, in which were the chief temples, was built upon a rocky hill rising from the valley of the Illysus, lying between the mountain-chains of Pentelicus and Hymettus, and situated about five miles from the port of Phalerum, on the Gulf of Ægina. This Acropolis (rock city) is approached by a broad flight of stairs leading to the Propylæum, or outer gate, with high pedestals on each side which were formerly surmounted by equestrian statues.

The Propylæum is composed of a porch of six Doric columns, giving access to a large vestibule flanked by two outer halls. This vestibule is divided by a flight of steps, placed between six Ionic columns on pedestals, supporting nine marble beams or architraves which carry the weight of the roof.

Beyond is a second porch, opening on the plateau of the Acropolis by means of five doors of different proportions. The lintel of the central or largest door measures 23 feet, while the architraves are 17 feet in length and of single stones.

The Athenians prided themselves greatly upon the vestibule of the Propylæum, and believed Pericles, by whose direction the building was erected, to have been divinely inspired. The details and proportions of the two orders here combined are of great beauty, and show the most refined study. From the farther porch, the Parthenon (meaning in Greek, virgin), or temple of Minerva, is seen to the right, exhibiting a fine perspective view of its North and West elevations.

The temple is raised upon a platform surrounded by steps, and is rectangular in form, composed of a cella, or oblong room, surrounded by an open portico. It measures 228 by 101 feet, having eight Doric columns on the front and seventeen on the flank, inclusive of the corner ones.

Ictinus and Callicrates were the architects, under the general supervision of Phidias, who designed the gold and ivory figure of Minerva within.

The Doric is of the hexametric order, having an approximate proportion of six diameters of the column to its height.

The pediments of the Parthenon were decorated with rich carvings in high relief, representing, in the one, the presentation of Minerva to the assembled gods by her father Jupiter, and in the other, the contest of Minerva and Neptune for the naming of the city. In the metopes were depicted the battles of the Athenians with the Centaurs, and scenes in the lives of Perseus, Theseus, and Hercules, in the admirable sculpture of Phidias.

The building stood almost intact from the fifth century before Christ to the seventeenth century of our era, when it suffered greatly from Venetian artillery, and in modern times its richest sculpture was torn from it under the Turkish régime, by order of Lord Elgin, who obtained permission from the authorities to remove it to the British Museum. One of the ships containing the marbles was sunk off Cape Matapan. Even in its ruined condition the Parthenon stands to-day a great example of the finest architecture the world has known.

On the plateau of the Acropolis are the three contiguous temples of Pandrosus, Erictheus, and Minerva Polias, and the temple of the Wingless Victory (Niké Apteros), of the Ionic order.

The temple of Pandrosus is virtually a porch attached to the larger temple of Erictheus. It is composed of six female figures or caryatides upon a high base, supporting an entablature without frieze. These figures are of exceeding grace and beauty, and are models of the sculptor's art. The single cella was probably divided into three, to which access was had separately by the several porches. The ceilings of these temples are flat and decorated with sunken panels, ornamented with egg and dart moulds. According to Diodorus Sicculus, the temple of Erictheus was erected in his honour by the Athenians, in gratitude for his having instructed them in the worship of Ceres, Goddess of Agriculture. While Pausanias states that it contained the miraculous spring created by Neptune, who shared in its dedication.

There are three windows in the wall of the cella—unusual features in Greek architecture—and the levels of the temples are different, evidently so arranged, with a view to distinguish them the more completely.

The temple of the Wingless Victory is supposed to have been erected where Ægeus fell from the wall upon seeing the black sails of his son's ship returning after his victory over the Minotaur. Others again assert that it was built without reference to site and so-called because the Athenians considered victory would never leave them, and consequently needed no wings. The temple is composed of a cella and two porches of four columns each, supporting a beautifully decorated entablature.

At the base of the Acropolis stood the resident portion of the city, containing also other temples and public buildings, which are still standing. The most important are the temple of Theseus, the Tower of the Winds, the theatre of Bacchus, and the monument of Lysicrates. Besides these there are many Roman buildings, but they belong to a subsequent period. Plutarch says that the Athenians under Cimon erected the temple of Theseus on his return from Crete, and that it is of older construction than the temple of Minerva. It has six columns in the front and thirteen in flank, supporting marble beams the extremities of which rest on the inner wall and correspond on the other with the triglyphs on the outer face. The metopes had carvings representing the exploits of Theseus. The temple stands at the base of the Acropolis to the North; it is similar to the Parthenon in many respects, being of the same Doric order, though less rich in sculpture. It is the best preserved of all the monuments, having suffered but little during the twenty-two centuries it has existed.

The Tower of the Winds, erected by Adronichus Cyrrhastes, is an octagonal structure surmounted by a frieze, upon which the eight winds of heaven are carved in allegorical figures. The roof is a pyramid of marble slabs and was at one time surmounted by a bronze triton holding a switch, which answered the purpose of a vane, but has since disappeared. The building was used as a water-clock.

[Illustration: PLAN OF THE TEMPLE OF THESEUS AT ATHENS.]

The choragic monument of Lysicrates, commonly called the Lantern of Demosthenes, is a circular structure of the Corinthian order. The spaces intervening between its six columns are closed by panels of a single stone upon which trivets are carved. The stone roof is decorated with scales and surmounted by a finial of delicate workmanship. On this was placed the tripod of the choir which had been successful in the Olympian contest of the year 375 B.C., according to inscription.

There are other Corinthian buildings scattered throughout Greece, but this is generally taken to be the best example and its proportions followed. The carvings of the frieze depict the exploits of Hercules, who is represented clothed in the traditional lion's skin.

On the opposite slope of the hill are the ruined chairs and benches of the theatre of Bacchus, fronting an open stage. In building a theatre, the Northern slope of a hillside was generally selected for the site, in order to avoid the direct solar rays. Seats were provided for the audience by cutting circular tiers in the rock and a marble stage, profusely ornamented, was erected facing them. The stage was raised in order that the orchestra might not interfere with the view of the actors, and a portico adjoining it, served as a promenade during the intervals in the performance.

The stadium, or circus, of Athens was formed in this way, taking in plan the shape of a horseshoe. It was here that the public games and races took place, the upper or circular end being occupied by the seats of the judges. It belongs, however, to a later period, having been constructed in the time of the Roman Emperor Hadrian. A few years ago the King of Greece caused the stadium to be excavated, and several marble chairs and seats were discovered.

Each city of importance possessed a Palæstra, or gymnasium, in which were rooms for bathing in hot or cold water, for the wrestlers to anoint themselves with oil and fine dust, and a school for young lads. The building was enclosed by a portico and surrounded by pleasure-grounds in which the public exercises took place.

The private dwellings were of one story in height, surmounted by terraces and divided by courts. The women's apartments were separated from the men's, and the larger houses contained banqueting-halls with accommodation for musicians and singers. The furniture consisted of tables in wood and choice stone, vases, candelabra, tripods in bronze, and rich Oriental carpets.

Externally the houses were painted brilliantly and decorated with wreaths, garlands, and arms. Outside the entrance door stood the statue of the god of the household—Jupiter, Minerva, or Mercury.

The richer citizens preferred country villas to city residences, which they surrounded with ornamental gardens and woods. The groves of the Academy where Plato held his school in the shade of the olives, outside the city gates, are probably the most celebrated of the latter.

The dead were buried in necropoli without the city, and their place of interment marked by tombs in the form of pyramids or funeral pyres, or more simply by a stella, or upright tablet, inscribed with the name and virtues of the deceased, and upon which were carved scenes in his life. In the colonies in Asia Minor the system of excavating chambers in the rock was adopted, the entrance to them being marked by Ionic columns supporting entablatures and pediments.

The public buildings of Athens were built of white marble from the island of Paros and the mountain quarries of Pentelicus, resembling in its fracture the purest loaf-sugar. The sun and rain have stained them to a tawny red during the many ages which have passed over them, and nearly all trace of the various dyes, with which they are supposed to have been coloured, has disappeared to-day.

The Greeks built their walls of bonded masonry, the vertical joints coming in the centres of the stones above and below, and they were frequently additionally strengthened by metal anchors. In walls of unusual thickness it was customary to construct the inside and outside faces first and fill the intervening spaces with loose stones and mortar, with an occasional through stone to connect the parts and bind them together.

The joints were sometimes emphasized by grooves, but this ornament was used more frequently in Roman work.

Until its introduction by the Romans the arch was rarely, if ever, employed, and the limit of inter-columniation was restricted by the necessity of finding stones of sufficient length to form the architraves.

The roofs were generally of wood, covered with terra-cotta tiles or sheet metal, and left open at intervals for the admission of light. This is, however, a disputed point, as the wood, being perishable, has left no positive proofs of the method employed. It appears that an awning or sail was stretched over these openings when services were being held. It is probable that in many instances there was no light admitted, except that from the entrance door. The effect of a religious ceremony performed in the temples by the artificial light of torches, with the flickering fires from the tripods and votive stands reflected upon the ivory and gold of the statues, and the smoke wreathing weirdly above the heads of the assembled multitude, must have been infinitely more impressive than if lit by the colder light of day.

The Greek colonists carried the principles of their architecture with them, leaving monuments of their genius wherever they established themselves. Of the temple of Diana, at Ephesus, nothing but a few fluted drums and scattered fragments remain to-day. It was the most magnificent temple of the Ionic order, erected with lavish expenditure, and decorated within with panels of cedar wood. It was burned and pillaged by the Persians.

At Agrigentum, in Sicily, and Pæstum, in Southern Italy, there are several Doric temples of massive proportions. Of these the temples of Concord, Jupiter, and Neptune are the most notable. The columns are shorter and their capitals broader than the Athenian type, and in one instance there are two orders superposed, within the cella, to support the roof.

The Greeks erected buildings in many parts of Southern Europe, in Asia Minor, and in Egypt, and in later times, even under the Roman conquest, they remained the masters of the arts, teaching their principles and supervising the erection of the monuments of Rome. The race was, indeed, peculiarly endowed with a genius for creating the beautiful, for though we have but scant information on the subject of Greek painting, we have preserved to us examples of sculpture which have never been surpassed or even equalled, and in architecture, though many more elaborate buildings have since been erected, nothing has ever been produced worthy of comparison with the harmonious proportions and majestic simplicity of the temples of Attica.

V.

ETRURIA AND ROME.

Etruria was peopled, from remote ages, by the indigenous inhabitants, and by colonizing races from Asia and Greece.

To the latter may be attributed the chief architectural works of the country; the ancient Etruscan walled cities resembling, in their general construction, those of Tiryns and Mycenæ.

Judging from the remains found upon the soil at the present day, the Etruscans used their knowledge of the laws of building principally in the erection of tombs. Of temples there now remain no traces; but, according to Vitruvius, they were composed, as a rule, of the rectangular chamber, or cella, of the Greeks, which was divided into three parts, and preceded by a porch of Tuscan columns. The origin of the latter he describes as follows:

“The Greek colonists, having brought to Etruria, the Tuscany of to-day, their acquaintance with the proportions of the Doric order, which was the only one as yet used in Greece, they employed this order there during a long period, in the same manner as in the country where it originated; but finally they changed it in several respects; they lengthened the column, and added a base to it; they altered the capital, simplified the entablature, and, thus changed, it was adopted by the Romans, under the name of the Tuscan order.”

Etruscan tombs varied with the nature of the districts in which they were erected. In the flat portions of the country they consisted usually of an earthen cone raised upon a circular foundation of masonry, with one or more chambers within for the reception of the dead. The largest of these tumuli was that called the Cucumella, at Vulci.

In the mountains, where material was abundant, it was customary to bury the dead in a square stone chamber, surmounted by a pyramidal roof, and entered by a doorway ornamented with the Greek architrave. There are several examples of these at Castel d’Asso.

A third form of sepulchre was the hypogee, or underground tomb, the entrance to which was marked by a colonnade of the Tuscan order, carved in the face of the rock; the interior apartment being usually rectangular, and reached by a staircase. The walls were decorated with paintings, and the tomb filled with vases, tripods, arms, and other votive offerings. The body was generally either placed in a stone sarcophagus or laid upon a bronze bed. The ceilings in the older tombs were either flat, being cut in the natural rock, with piers left as supports, and ornamented with sunken panels, or constructed of inclined slabs, resting against and sustaining each other.

The corbelled vaults, similar to those of Mycenæ, were employed for a considerable number of these buildings, but were subsequently relinquished for vaults of voussoirs, or wedge-shaped stones. The invention of the semicircular vault, the joints of which converge to a common centre, was long attributed to the Etruscans, but we have seen that recent discoveries have shown that it was already in use in Egypt and Assyria many centuries before.

This principle, however, was the chief feature of Etruscan architecture, and its great legacy to succeeding styles.

Etruria as well as Greece sent artists to Rome, and the conjunction of the methods used in the two countries produced Roman art.

“The Romans took from the Etruscans the semicircular arch, formed of jointed stones; from the populations of the Campagna they obtained the general arrangement of sacred edifices, the Greek orders, the distribution and decoration of private dwellings. They drew thus from two different sources, and endeavoured to unite two principles diametrically opposed to one another—the principle of the Greek lintel and the Etruscan arch. In doing this they show clearly that their ideas upon the arts were but little better than those of pirates, whose acts are actuated by pride rather than by taste, and who adorn themselves in spoils of distinctly different origin, the mingling of which produces unseemly contrasts.”[3]

THE ROMAN ORDERS.]

[Illustration: COMPOSITE.]

In fact, the Greek orders, modified to suit the taste of the Romans, and combined with the Etruscan arch and vault, formed the basis of all Roman architecture. The scale of their buildings, however, was vastly greater than that of those upon which they were modelled. The colonnades of their palaces and the arcades of their aqueducts were to be measured by the mile, the vaults of their baths were of prodigious span, and, in general size and number, the edifices erected by the Romans exceeded anything which had come before them.

The Roman orders were five in number, namely, the Tuscan, Doric, Ionic, Corinthian, and Composite.

The Tuscan we have already examined. The Doric was somewhat more elaborate, having additional mouldings in the capital and base, and the triglyph ornament in the frieze. The Ionic and Corinthian were but modifications of the corresponding Greek orders. The Composite was of the same proportion as the Corinthian, the capital being a combination of the Ionic and Corinthian.

The Corinthian order was the most generally used, its rich character suiting the ostentatious ideas of the Romans. The superposition of columns was a common method of indicating different stories, and different orders were often employed where different-sized columns occurred in the same building.

In plan the Roman buildings were rectangular, polygonal, and circular, or combinations of these geometrical forms. The materials used were local stone, imported marbles and alabaster, and bricks, which were flatter and longer than the form employed at the present day. The Romans excelled in their mortars and cements, which were of a strength sufficient to make their walls virtually of one mass.

In bonding their stone they employed various methods, including those of the Greeks. Of these, a favourite one was the building of exterior faces only, and filling up the intervening space with broken stone and mortar. In order to produce the greatest effect at the least cost, in the use of marble, they resorted to panelling the external surfaces only with thin slabs. Interiors were lined with stucco and frequently ornamented with paintings, and the floors inlaid with mosaic. Roman mouldings were sections of the sphere, differing from the Greek, which were hyperbolas or parabolas.

The chief constructions of the Romans were houses, temples, palaces, amphitheatres, theatres, aqueducts, sewers, baths, triumphal arches, tombs and commemorative structures, camps, bridges, and basilicas.

[Illustration: PALACE OF DIOCLETIAN AT SPALATRO.

(_From Durand._)]

In, and in close proximity to, the Forum Romanum, or Campo Vaccino, are admirable examples of nearly all these different buildings. The level of the ancient market-place is several feet below that of the streets of modern Rome, but in the excavated portions are to be seen the old pavements of irregular stone slabs, laid upon concrete foundations and worn with the wheels of chariots.

Many ruined temples, the arches of Septimius Severus, of Titus and Constantine, the palace of the Cæsars, the Colosseum, and the Baths of Constantine are collected here within a stone's throw. By taking up each class of buildings separately, however, we will get a better idea of the nature of Roman architecture than by a description of isolated buildings.

Roman houses resembled in a measure the Greek, the different apartments being grouped around inner courts. The rooms consisted of halls, vestibules, banqueting-rooms, and sleeping-chambers, the women not being separated from the men, as was the case in Greece. The courts were surrounded by colonnades and in the centre a well was usually placed, to receive the water from the roofs. Many of the houses were several stories in height, but a limit to their altitude was fixed by decree.

The excavations in Pompeii have uncovered many interesting specimens of private dwellings, richly decorated with several paintings and having elaborate mosaic patterns on their floors.

In the city of Rome the palace of the Cæsars was the most notable example of domestic architecture, but at the present day it is difficult to discern among the débris and fallen walls what its original plan may have been. Some paintings in the so-called house of Livia, upon the plateau of the palace, however, show that the artists of the period had attained a high degree of merit.

[Illustration: PLAN OF THE PANTHEON AT ROME]

Roman temples consisted generally of a cella or rectangular apartment, preceded by a porch, the whole being raised on a platform, reached by stairs and enclosed by a colonnade below. Occasionally there was a double cella, with separate entrances and porches, as in that of Venus and Rome; and there are two remaining examples of circular temples—that of Vesta, on the Tiber, in Rome, and of the Sybil, at Tivoli—while still another type, that of the Pantheon of Agrippa, had a circular cella and a rectangular porch.

The Corinthian order was the most frequently employed, that of the temple of Jupiter Stator being the richest, while those of the Pantheon, the Maison Carrée, at Nîmes, and of the temple of Antonine and Faustina are admirable specimens.

This last is one of the best preserved temples, being very nearly entire at the present time; its frieze is of the most refined workmanship, representing allegorical animals, plants, etc.

The temple of Fortuna Virilis is a good example of the Ionic order, but this order was never a favourite with the Romans.

[Illustration: PLAN OF THE BATHS OF AGRIPPA CONNECTING WITH THE PANTHEON, ACCORDING TO PALLADIO.

(_From Durand_)]

A debased form of Ionic is that of the temple of Concord, or Vespasian, where the capital is altered to a considerable extent and a rope moulding added. A remarkable constructional feature of this temple is the relieving arch of brick, concealed behind the frieze, to diminish the weight on the lintel below.

The great drum of the Pantheon, enclosed by a circular vault, is one of the earliest examples of domical architecture. A notable feature in it is the absence of the keystone, which is replaced here by an open ring, leaving an aperture for the entrance of light. The walls are pierced with niches and relieved by immense arches. The pediment of the porch is one of the most perfect remaining; in height its proportion exceeds that of Greek temples.

The temple of Diana, at Nîmes, is a remarkable structure, having three aisles, the central one being decorated with niches and columns, which support an entablature and a ribbed vault.

The ruined temples of Baalbek and of Jupiter Olympius, at Athens, are among the most colossal of this class of building. The Corinthian columns of the latter measure upward of sixty feet, and their capitals are of singularly fine workmanship.

The Emperor Hadrian embellished Athens with numerous and splendid buildings, which to-day have assumed the colour and ruined appearance of the older constructions of the time of Pericles.

Of the temple of Jupiter Olympius there are scarcely more than a dozen columns standing of the original one hundred and twenty. The Turks ground up many of them to make lime for their mortar.

The Romans took their conception of the theatre from the Greeks. The building was composed of two parts, the one devoted to the stage and its accessories, and the other to the accommodation of the audience. The stage was usually in the form of a rectangle,

the longer side of which formed the diameter of the semicircle, which was the plan of the second part. The latter was composed of concentric seats in successive steps, to which access was had by stairs radiating from the centre and leading to an upper surrounding gallery. At the foot of these steps a space was reserved called the orchestra (Greek, “dancing place”), usually occupied by the senators. The stage, which was decorated with columns and niches, was raised above the orchestra, and was connected with the actors’ rooms. The wall at the back of the stage was carried up to the level of the circular enclosing wall, and treated with superposed orders. The theatre of Marcellus, in Rome, and those of Herculaneum, Arles, and Orange are among the best examples.

The most celebrated amphitheatre (amphi theatron, Greek, “double theatre”) is that commonly known as the Colosseum, or Flavian Amphitheatre. It is composed of the arena or oval space, occupied by the combatants, and of the “visorium,” formed by concentric seats placed in tiers, one above the other.

[Illustration: PLAN OF THE TEMPLE OF THE SUN AT BAALBEK.]

It was capable of seating eighty thousand spectators, and upon its arena four thousand gladiators have fought at a time. It was here that before commencing their combats they came to the foot of the emperor’s throne, saluting him with the celebrated cry, “Morituri te salutamus.”

The substructure of the building consists of vaulted passages, communicating with the visorium by numerous staircases, and with the exterior by the doors called “vomitoria.” The arena was surrounded by a ditch of running water, and under it were chambers in which prisoners and animals were confined.

The visorium was divided according to the rank of its occupants. The upper classes occupied the “podium” or lower gallery, which extended on either side of the emperor’s throne, at the extremity of the longer axis of the building. For protection from the elements during performances an immense sail was stretched over the building from posts inserted in stone brackets at the top of the exterior wall.

The heights of the three lower stories of the Colosseum are marked externally by arcades and superposed orders with engaged columns, Doric, Ionic, and Corinthian, and the fourth and upper one by Corinthian pilasters. The entablatures of each order are carried around the entire circumference of the building.

Architects generally criticise this construction adversely, for “if, on the one hand, the engaged columns might be supposed to serve as buttresses and thus become a useful decoration, it must be admitted, on the other, that the projecting entablatures carried from column to column do more harm than good as regards the solidity of the building. [The architrave having no longer the force of the Greek lintel, being composed of several blocks supported by the arch below.] The Romans, however, did not always falsely apply the true principles of architecture. In the arena of Nîmes, for instance, the two superposed orders which serve as buttresses between the arcades of the two stories on the exterior of that building, are real buttresses. The lower order is composed of projecting piers, the upper order of engaged columns; the cornices follow the contour of each pilaster or column and do not form those projecting belts which are placed so clumsily and uselessly around such buildings as the theatre of Marcellus and the Colosseum of Rome.”[4]

[4] Viollet le Duc.

This amphitheatre was commenced by Vespasian and continued under Titus, who dedicated it in the year 80 A.D. In the ninth century it was half destroyed, and subsequently became a quarry, from which materials were extracted for the construction of the Farnese palace and other buildings.

A large part, however, is standing to-day, having been rescued from total destruction by order of Pope Benoit XIV.

There are celebrated remains of amphitheatres at Verona, Pola, Capua, Arles, and Nîmes. Circuses and Naumachias belong to the same class of buildings, the one serving for chariot and other races, and the other for naval combats. The arena in each was oval in plan and from it rose the successive tiers of broad steps upon which the seats were ranged. At the top a portico decorated with statues enclosed the whole building.

The Circus Maximus was the most important of these, containing numerous splendid statues and obelisks, and covering a vast area.

The aqueducts of ancient Rome stretched for miles across the Campagna. The channel in which the water flowed was supported by one or more arcades, superposed according to the height required. These arcades consisted of round brick arches carried on substantial piers, and were placed where possible upon the highest elevations of the country they traversed. At intervals wide basins were provided for the collection of sediment, and reservoirs received the water at their termination. From the latter pipes supplied the baths and private dwellings.

In France the famous Pont du Gard is a portion of an immense Roman aqueduct formed of three rows of arcades, which supplied the city of Nîmes.

Bridges were constructed on the same principle; the arches increasing their span according to the depth of the piers upon which they rested, being generally of two stories, the upper one having double the number of piers.

The Roman bridges and aqueducts in Spain are among the most justly celebrated, notably those of Segovia, Tarragona, and Alcantara. Bridging rivers by boats was a common method in use by the Roman armies under Julius Cæsar. We have also an account of a wooden bridge over the Danube, constructed by Trajan.

Under every street in Rome there ran vaulted sewers conducting all impurities into the main artery, called the Cloaca Maxima, which in turn discharged its contents into the Tiber. This sewer is one of the oldest examples of the use of voussoirs, dating from the reign of Tarquinius Priscus. It is covered by a triple vault, sustaining the street above.

Agrippa conducted the waters of several streams into the sewers and appointed inspectors to keep them in repair and good order.

In the building of the baths of Rome, Agrippa, Nero, Vespasian, Caracalla, Titus, Diocletian, and Constantine vied with each other in the production of the most magnificent structures. They are to-day in a hopelessly ruined condition, but from the numerous fragments of carved marble and panelled stucco lying on their sites, and from the rich paintings and mosaics of the baths of Titus and Caracalla, it is not difficult to form an idea of their original splendour.

It is not a little significant of what their rich decoration must have been to note that such marvels of statuary as the Laocoon, the Farnese Bull, and the Gladiators have been discovered within them. Besides the necessary administrative rooms, these buildings generally contained a frigidarium or cold bath, a tepidarium or warm bath, and a sudatorium, circular in form and covered in by a dome. The walls, built of brick, were pierced with niches and supported high cross and barrel vaults of immense span. It has been conjectured that the Pantheon was the entrance hall of the baths of Agrippa, the porch having been added at a later period when the building was converted into a temple.

The chief commemorative structures were triumphal arches and votive columns. The former were of two kinds, having either one main arched opening, or a large central arch for vehicles and two lower ones on either side for foot passengers. The arch of Titus in Rome is an example of the first, its main arch being flanked by composite columns, supporting a richly carved entablature, which is in turn surmounted by an attic, inscribed with the dedication to the conqueror by the Senate and Roman people. The bassi relievi employed in its decoration represent the sacking of Jerusalem by Titus; a specially notable feature among the spoils depicted being the golden candelabra with the seven sockets, mentioned in Scripture history.

The arches of Constantine and Septimius Severus are of the second category. They are covered with rich sculpture and are of very beautiful proportion. Famous arches are those of Orange in the south of France, Beneventum, Ancona, Rimini, Pola, and Athens. Everywhere, in fact, where a victory was to be commemorated, or the termination of a great military road to be marked, it was customary to erect an arch.

Another method of paying homage to great men was to erect columns surmounted by their statues. The columns of Trajan and Antoninus in Rome are especially remarkable. The former is the higher and of the best workmanship. The pedestal upon which it rests is ornamented with elaborate carvings representing the arms of conquered nations, and is enriched at the four upper corners of its cornice by imperial eagles with garlands suspended between them. A wreath replaces the torus or round mould at the base of the column, and around the shaft is wound a ribbon of sculpture, representing a triumphal procession, which terminates at the capital. Isolated columns were also often employed for the inscription of legal notices, as boundary-marks, or for marking military limits.

The gates at the entrances of the principal cities were similar to the triumphal arches. There are two especially fine examples in France, those of Autun and Treves. In these the attic story is replaced by a gallery connecting the two flanking wings, which are

several stories in height, and contain chambers which it is commonly supposed were used as courts of justice.

Roman camps were regulated and arranged with military precision, and were of two descriptions. The one, erected for temporary use, was defended by a rude palisade of branches and a ditch, the other, the “castra hiberna,” or winter quarters, was generally a permanent structure, built of brick, containing within a square enclosure the barracks, workshops, hospitals, and other necessary buildings. This enclosure was divided by cross-roads, passing through gates in the outer wall. The gate facing the enemy was called the porta prætoria, hence prætorian camp.

Necrological monuments were built in various forms, from the simple tablet to the immense mausoleums of the emperors. Just without the walls of Rome are still to be seen the remains of the sepulchre of Caius Sestius, a large pyramid containing a chamber several feet above the ground level. Farther out, on the Appian Way, is the tomb of Cæcilia Metella, a cylindrical structure upon a square base, of considerable magnitude. The exterior is simple, the only decoration being a series of ox-skulls in the frieze. This building was probably originally surmounted by an earthen cone, after the manner of the Etruscan tombs.

The tomb of Augustus was constructed in a similar manner but on a larger scale. The entrance was preceded by a porch and the exterior walls contained niches. The conical mound above was planted with trees and shrubbery.

The Scipios were buried in stone sarcophagi in a subterranean chamber, which has been but recently discovered.

A curious monument was that of the Horatii, consisting of a rectangular block of masonry, containing the sepulchre, surmounted by four stone cones, grouped around a fifth and higher one. These probably had a symbolical meaning, as a similar structure, called the tomb of Porsenna, is said to have existed in Etruria.

By far the most magnificent building of the kind was the Mausoleum, or Mole of Hadrian, the ruins of which now go by the name of the Castel St. Angelo. The tomb rose conspicuously on the banks above the Tiber, on a square foundation; its two upper stories were circular in plan, and decorated with colonnades and statuary, and the whole was capped by an immense roof, terminated by a pineapple of bronze.

The tombs of St. Helena and St. Costanza were circular structures similar to that of Cæcilia Metella, the cone of earth, however, being replaced by a dome. The interior of the tomb of St. Costanza was divided by columns which sustained a vault connecting with the outer wall.

The practice of burning bodies and preserving their ashes gave rise also to the building of columbariums, rectangular structures containing in their walls receptacles for funereal urns.

In the valley of Jerusalem the hypogee was the form of sepulchre commonly adopted, its entrance being decorated with a colonnade of one of the Roman orders.

Basilicas were the law courts of the Roman people and places of assembly for the transaction of their daily affairs. On the exterior, these buildings were surrounded by numerous courts and porticos, where the merchants assembled daily to discuss their affairs or to await the result of the trials conducted within. In the interior they contained a large hall or nave flanked by side aisles, preceding a transept or further room which was terminated by a semicircular apse. This apse was occupied by the magistrate while presiding in the cases submitted to his decision.

The ruins of the basilicas of Titus and Maxentius remain, at the present day, in sufficient preservation to show that in the one a flat ceiling of timber was employed, and in the other a system of intersecting vaults similar in construction to those of the baths of Caracalla. There are traces of several ancient buildings of this kind, but it is supposed that many were pulled down by the Christians, who erected churches on their sites, using the old basilica as their model.

The plan was, in reality, but an improvement on that of the Roman temple, the side aisles and transepts being naturally developed additions to the older cella to which the apse had been added previously in many examples.

The great administrative power governing the erection of the buildings of Rome was one of the most remarkable features connected with them. Architecture with the Romans was a means to an end, this end being the construction of edifices suiting their requirements and their desire for display. No scope was allowed for individual talent or ingenuity, unless employed in the carrying out of a distinct programme, laid down by those in power; each building forming part of a great scheme, prevailing throughout the conquered world.

In Greece architectural works were produced in the different cities and states under the guidance of independent artists, with the co-operation of their fellow-citizens who were eager to attain the true principles of art; in Rome and the Roman world, art was entirely subservient to a system of politics which ran through all departments.

The vast wealth which flowed into the capital from tributary provinces was the great mainstay which permitted the execution of so many vast and expensive structures, forming a collection never surpassed. Roman art corresponded with the national character, for it was coarse and ostentatious, but at the same time vast and strong. The population of Athens delighted in intellectual pursuits, in philosophy, in art; it crowded the seats on the slope of the Acropolis to enjoy the wit and satire of Æschylus and Sophocles, and the palæstra to witness the development of bodily grace and dexterity, while the Romans flocked to the Colosseum for the enjoyment of scenes of blood and carnage, to gaze upon the slaughter of captives and the anguish of animals. The force of their government, nevertheless, was unquestionable; their patriotism, unlike that of the Greeks, was unaffected by civic jealousies or party feeling; they trod rough-shod upon the nations, but they planted everywhere the imprint of their heroic civilization and made their capital the centre of the world, and left to it, for all ages, the proud appellation of the Eternal City.

VI.

THE EARLY CHRISTIAN STYLE.

After the conversion of the Emperor Constantine to Christianity, in the fourth century, the Christians who, as a persecuted sect had hitherto held their religious observances in hiding, in the catacombs of Rome, adopted the basilica as the most convenient form of building for the purposes of their worship. The bishop occupied a throne in the apse, surrounded by the presbyters or fathers of the church, and the congregation of the faithful filled the central nave.

For several centuries this plan was but little changed, the only notable additions to it being the continuation of the transept beyond the line of the walls of the nave, thus making it cruciform; the occasional substitution of double aisles, making five divisions in the body of the church, instead of the original three, and the addition of a tower or belfry.

All subsequent churches, whether Romanesque, Gothic, or Renaissance were constructed on but slight modifications of this original plan, which, in fact, was itself evolved from that of the Roman temple.

Illustration: PLAN OF THE OLD BASILICA OF ST. PAUL'S BEYOND THE WALLS.

A - Apse T - Transept N - Nave X - Narthex]

The first basilicas erected for Christian worship had double aisles; this form was, however, soon discontinued, probably owing to the difficulty of observing the offices of the clergy from the outer aisle. Of these St. Peter's, St. Paul's beyond the walls, and St. John Lateran were the finest examples. The first-named was built upon the site of the present cathedral, and was removed in the sixteenth century to make room for it. Its dimensions were of notable size, being about 380 feet long by 212 feet in width. It was preceded by an atrium, or open court, surrounded by a colonnade, in which the Christians met to transact their affairs. The basilica of St. Paul's was destroyed by fire in the early part of this century, and a new structure resembling the old was erected in its place on a scale of great magnificence. The columns of its Corinthian colonnade and the floor are of polished marble and the wooden roof lavishly ornamented with carving and gilding. The transept is enriched with mosaics, and contains a baldachin over the altar, in which malachite and other choice stones have been used unsparingly.

A typical basilica was generally arranged as follows: The atrium or quadrangular open court, surrounded by porticos, preceded the main building, or was replaced by a porch composed of columns sustaining a low roof which was called the narthex. Within, the structure was divided into a nave, side aisles, transept, and apse. The nave (derived from "navis," a vessel, symbolical of that of St. Peter) was loftier than the adjoining aisles, the upper wall being usually panelled with pictures and pierced at the top by a range of windows, from which the Gothic clerestory was derived later on. In one or two instances where the side aisles had a second story or upper gallery for the women, the panels and windows were placed in the outer wall.

The interior lines of columns were usually of the Ionic or Corinthian orders, having been taken from older buildings, but if new they were of stouter proportions than the Classical models. These columns supported either a continuous architrave or circular arches.

Wooden doors, often covered by chased bronze, were hung in the main entrance and the wall above was usually pierced by a round window or bull's-eye, afterward developed into the rose window. At the other end of the nave a wide arched opening, called

the triumphal arch, connected it with the transept.

An enclosure, separated from the body of the church by a balustrade, at the upper end of the nave, contained the seats of the choristers and the reading-desks.

The altar was placed in the transept and was frequently surmounted by a baldachin composed of four or six columns supporting a light dome. Behind the altar in the centre of the apse was the throne (cathedra) occupied by the bishop (episcopus), being raised by steps from the semicircular stone seats (exedra) used by the presbyters, which were covered with carpets. The walls of the transept and apse were inlaid with mosaic inscriptions and pictures, in which the head of our Saviour, the figures of saints and holy emblems were the chief subjects. Deep blue, purple, and green were the prevailing colours and the letters were of gold. The floors were decorated with mosaic patterns. The roofs were either flat with sunken panels framed with mouldings and gilded ornaments, or else showed the open trussed wood-work, though the latter was the exception. Externally there was no attempt at enrichment, the exterior generally offering a great contrast to the lavish internal decorations.

At the present day nearly all the basilicas have undergone transformation, the old roofs have been replaced, the walls covered with a modern adornment of pilasters and gaudy paintings, the colonnades have been broken through to allow of entrances to side-chapels, or disfigured by the heterogeneous decoration of the eighteenth century, and the exteriors treated with renaissance façades.

Nevertheless the general plan and arrangements have remained substantially the same, and we have very interesting specimens of this class of building in St. Maria Maggiore, St. Agnese, San Clemente, and others, in Rome, San Appolinare, in Ravenna, the basilicas at Torcello, in the Venetian lagoons, and later examples in St. Ambrogio, of Milan, and St. Maria Sopra Minerva, in Rome. The basilica at Torcello was built mainly from fragments of an older church upon the mainland at Altino. The bishop’s throne is one of the most interesting and best preserved examples we have.

The Greek name for this, cathedra, was the origin of our term cathedral, applied to churches containing the bishop’s seat, there being no architectural distinction between the buildings.

From the tombs of the Romans the Christians derived their conception of the edifices which they used as baptisteries. Their exterior walls were either polygonal or circular, and of severe simplicity. The interiors were generally divided by a row of columns sustaining a round vault, and forming a circular enclosure in which the font was placed. A wall, carried on these columns, contained windows, and served as a lantern to light the building. This wall occasionally supported a dome. San Stephano Rotondo, in Rome; St. Angeli, in Perugia, and St. Vitale, in Ravenna, are the best examples among the many found in Italy.

San Stephano has a double range of interior columns, taken from Roman temples, the one supporting an entablature, and the other a series of arches. The church has been much modified by successive alterations, and the interior is ornamented with curious paintings, representing the sufferings of the martyrs.

The baptistery of St. Angeli is smaller, but has preserved its original form in a greater degree.

[Illustration: ST. VITALE, OF RAVENNA.]

[Illustration: THE TEMPLE OF MINERVA MEDICA.]

St. Vitale is a type of structure much copied in subsequent buildings. It is itself modelled on the so-called temple of Minerva Medica, differing only in having an octagon instead of a decagon plan. Of this Fergusson gives the following account:

“It certainly belongs to the best days of the Roman empire, if, indeed, it be not a Christian building, which I am very much inclined to believe it is, for on comparing it with the baptistery of Constantine and the tomb of St. Contanza, it shows a considerable advance in construction on both of these buildings, and a greater similarity to San Vitale, at Ravenna, and other buildings of that time, than to anything else now found in Rome.

It has a dome eighty feet in diameter, resting on a decagon of singularly light and elegant construction. Nine of the compartments contain niches, which give great room on the floor, as well as variety and lightness to the general design. Above this is a clerestory of ten well-proportioned windows, which give light to the building; perhaps not in so effective a manner as the one eye of the Pantheon, though by a far more convenient arrangement, to protect from the elements a people who did not possess glass.

“So far as I know, all domed buildings erected by the Romans up to the time of Constantine, and, indeed, long afterward, were circular in the interior, though they were sometimes octagonal externally. This, however, is a polygon both internally and on the outside, and the mode in which the dome is placed on the polygon shows the first rudiments of the pendentive system, which was afterward carried to such perfection by the Byzantine architects, but is nowhere else to be found in Rome. It probably was for the purpose of somewhat diminishing the difficulties of this construction that the architect adopted a figure with ten instead of eight sides.”

The plans of the temple of Vesta and of the baptistery of Constantine have been placed here next to one another in order to show the transposition of the columns from the exterior to the interior, which is the chief distinction between the Roman circular buildings and Christian baptisteries.

VII.

THE BYZANTINE STYLE.

Constantine and his mother St. Helena built churches in Bethlehem, Jerusalem, and Antioch, and embellished Constantinople with numerous splendid edifices. The Eastern basilicas preserved the same character in their construction as those of Italy, but their component parts were more homogeneous, the materials being specially prepared, instead of being borrowed from ancient buildings. The first vigour of emancipated Christianity found vent not only in the erection of edifices devoted to its religious observances, but in the infliction of irreparable injury upon the pagan monuments of Greece and Rome. Constantine brought many fragments of these Classical buildings to the new capital, but they have been destroyed, together with the palaces, churches, and baths which he built there, in successive invasions, by fire, or by earthquakes.

In Thessalonica there are two good examples of early basilicas—the old mosque and the five-aisled church of St. Demetrius; and in Northern Syria there are many admirable specimens. Of these the churches at Rouheilia, Kalb-Louzeh, and Tourmanim deserve special mention.

The latter is a particularly successful building, designed in the new style growing out of the older Roman one, and is a model structure, being constructed exactly in accordance with the requirements of the early Church.

In plan, the Syrian conventual buildings depart but slightly from that of the basilicas of Rome, but in their interior treatment they show a gradual secession from the rules which govern Classical buildings, retaining only their useful and discarding their merely ornamental features.

When the seat of the empire had been transferred to Byzance, the Christians carried with them the principles of the arch and the vault and combined them in a new form of structure. This construction, differing from that employed in Rome, combined with Eastern or late Greek forms of ornament, produced a new style called the Byzantine.

The distinctive feature of this method of construction was the placing of the circular dome, not upon a cylindrical drum, as had been done by the Romans in the Pantheon and other buildings, but upon four walls, square in plan, surmounted by semicircular arches, with the intervening spaces occupied by pendentives. To each side of this central square was joined a nave of the same length, forming thus in plan a Greek cross, that is, one having each arm equally long. These naves were usually short, more frequently semicircular than rectangular, and often terminated by an apse.

[Illustration: THE PENDENTIVE SYSTEM IN BYZANTINE DOMES.]

We have seen, in the baptistery of St. Vitale, at Ravenna (in which Greek artists were undoubtedly employed), a tendency to reduce the number of sides of polygonal buildings supporting circular domes; the architects of Byzance were therefore merely taking another step in the same direction when they placed the dome upon a quadrilateral substructure.

To comprehend the pendentive, let us take a circle and inscribe within it a square; at the four angles of the square we will place solid piers of masonry and connect them with semicircular arches. Let us now suppose that a hemispherical dome had been built upon this circle as plan, and we will see that the planes of the arches and the plane passing at the level of the top of the keystones

of the arches, in intersecting this dome, would leave but four triangular portions of it. These triangular portions are called pendentives, and are the only portions of the original hemisphere which are actually built. As this hemisphere would have been necessarily constructed of materials the joints of which would have radiated from the centre of the sphere, so also do the joints of the pendentives radiate from this same centre, which is identical with the centre of the original circle. The plane passing at the level of the top of the keystones in intersecting the hemisphere describes another circle, upon which the actual dome is placed. The question has not been established satisfactorily whether the Byzantine architects really understood the pendentive, as in many instances they resorted to less scientific methods of filling in the vacant spaces between the arches and the upper dome, but the only logical method of constructing it is that which has just been described.

In building domes, it was not uncommon in the East to replace stonework by light terra-cotta pipes, fitting into each other, giving great lightness and comparative strength.

Justinian gave a marked impetus to architectural work and to the building of religious edifices in particular. He commissioned Anthemius of Thralles, and Isidor of Miletus, to execute the plans for the new church of St. Sophia, upon the site of an older building of Constantine, also dedicated to the “Holy Wisdom,” which had been burnt during an emeute soon after it had been repaired by Theodosius.

Justinian had already built the church of Sergius and Bacchus in Constantinople, on a plan nearly identical with that of St. Vitale, at Ravenna, with the exception that the whole structure was externally in the form of a square, enclosing the octagon supporting the dome. This served as a stepping-stone to the conception of the larger church, which became the type of all subsequent Byzantine constructions.

[Illustration: CHURCH OF SERGIUS AND BACCHUS AT CONSTANTINOPLE.]

[Illustration: PLAN OF ST. SOPHIA, CONSTANTINOPLE.]

By comparing the plans of the Pantheon, the temple of Minerva Medica, the baptistery of Constantine, St. Vitale, at Ravenna, and the church of Sergius and Bacchus, in the order in which they are enumerated, with that of St. Sophia, the sequence and continuous progress of domical construction is at once apparent, and such comparison explains the successive steps in a more satisfactory manner than a folio of description.

“The church of St. Sophia,” says M. Texier, “is built on a square plan, 251 feet long by 186 feet wide. In the centre of this square rises the dome, the diameter of which, measuring 108 feet, determines the width of the nave. The dome is supported by four great arches and four pendentives. Two hemispheric vaults abut against the two arches, which are perpendicular to the axis of the nave, giving it an oval appearance. Each of these hemispheres is itself pierced by two smaller hemispheres carried on columns. This superposition of domes, whose points of abutment are not visible, gives to the whole structure a lightness difficult to realize.”

The church is built upon a foundation of béton twenty feet deep. It is preceded by an atrium surrounded by a portico of the Ionic order. The nave is entered by a double narthex, or porch, extending along the whole width of the West front. The interior, both floor and walls, was formerly adorned with rich marbles, and paintings upon a ground of gold. The dome was built of light bricks faced with hard cement and mosaic, and was lighted by forty windows. Originally a painting of the Holy Father was placed in the centre of the dome, and four cherubim in the pendentives. The latter are still to be discerned under the coat of whitewash with which the Turks have hidden the original magnificence of the interior.

The apse, lighted by three windows, contained the throne and seat of the Church fathers. The columns supporting the great arches and the galleries, originally occupied by the women, are of rare marble, eight of them having, it is said, formed part of the temple of Diana at Ephesus, being brought, together with the spoils of many Eastern and Western buildings, to adorn the great edifice. The foliage of their capitals is fine and sharp and intricately interlaced, having no resemblance to the Classic models beyond a debased form of the volute which terminates their upper corners. This style of ornament is a distinguishing feature of the Byzantine style, and reappears in many examples both in the East and West.

The church, commenced in the year 532, took sixteen years to build, during which time incredible sums were expended upon it. When completed, the appearance it presented was most magnificent, resulting not only from the rich marbles, wood-work, paintings, and mosaics with which it was decorated, but also from the countless candelabras, curtains, precious vases, and golden vessels with which it was furnished. After the capture of Constantinople by Mahomet II., in the year 1453, St. Sophia was converted into a mosque, and suffered greatly at the hands of the Turks. It is only within recent years that any attempt at preserving its original

splendour has been made.

The architectural principles upon which St. Sophia was constructed were reproduced in all Byzantine buildings in Italy and France as well as in the Orient. In Turkey, indeed, the edifices subsequently erected are almost counterparts of the original structure, the mosque of Suleiman and that of Achmet, built as late as 1610, embodying almost identical features of construction.

In Athens there are two or three small Byzantine churches, which, though differing greatly in point of size, are founded upon the plan of the mother church; and in Asia Minor generally and Armenia especially, there are a great number; notably the churches of Daghour and Pitzounda and the cathedral of Anim.

The decoration of some of the latter differs from the usual Byzantine methods in the frequent revival of Classic forms, and in the use of thin pilasters, carrying blind arches on the exterior.

This feature reappears in the buildings of Italy, influenced by the style, particularly at Pisa.

In some later buildings a new manner of obtaining light was introduced, by raising the dome upon a cylindrical drum, supported by the four arches and pendentives of the older system. St. Nicodemus, of Athens, is one of the best examples of this.

When the body of St. Mark was brought to Venice, having been stolen from Constantinople by means of a clever trick about the year 831, the Doge Partecipazio ordered a church to be built to his memory. The greater part of this building as it stands to-day dates, however, from the tenth century. It resembles St. Sophia in a great degree, the frequent intercourse of the Venetian maritime population with the Orient having enabled them to study the principles of Byzantine art, and to bring spoils from the buildings of the East to their native city.

St. Mark's has also much affinity with the church of Mone-tes-Koras, in Armenia, the principal façade, with its five large bays decorated with columns and arches framing the five doors which give access to the church, being identical in general conception.

The interior of the building has the form of the Greek cross, the four arms of which and also the central compartment formed by their intersection, are roofed by domes supported on arches and pendentives. The style of ornament is very similar to that of its prototype, with its rich gold mosaics, frescos, and inlaid marble, some of the details being essentially Oriental in character.

The constructors of the pendentives in St. Mark's do not seem to have properly understood that they formed part of a sphere to the centre of which their joints should have converged, but filled up the spaces between the supporting arches by a series of small superposed arches.

The influence of this Byzantine construction extended into Aquitania, in the South of France. At the close of the tenth century a number of churches were erected there, with the dome as a prominent feature. St. Front, of Perigueux, was built upon a plan closely resembling that of St. Mark's in Venice, and very nearly upon a similar scale of dimensions. The architects of the church, however, seem to have distrusted the strength of the semicircular arch, and resorted to the ogival[5] or pointed form as a means of securing greater supporting power, although this arch had not as yet been adopted in France.

[5] From augere, to strengthen.

They, too, failed completely to grasp the principle of the pendentive, as those of St. Front are formed of corbelled stones with horizontal beds, instead of voussoirs converging to the centre of the hemisphere of which they should form part.

Besides St. Front, the churches of Fontevrault, Souliac, Angoulême, and others in Aquitania were built with similar characteristics, though in plan they adopted the Latin instead of the Greek cross. The abbey church of Fontevrault is perhaps the most successful of these, the four domes of its nave producing a very pleasing effect. The greater number of these buildings were erected during the eleventh and twelfth centuries, in an imported fashion, rather than in a style destined to be engrafted upon French national architecture.

All of them show the want of a clear comprehension of the principles involved, and are evidently foreign to the taste of the people.

The introduction of this style in France, offers a parallel case to the introduction of Gothic architecture in Italy, a century or two later, for in neither case were the styles in accordance with native inspiration.

MAHOMETAN ARCHITECTURE.

The year 622 of our era is a remarkable one in historical annals, being the date of the flight of Mahomet, the Hegira from which all events are computed by followers of his religion. Within a marvellously short period the new faith spread from the confines of Arabia, throughout Asia Minor and Persia and all along the North coast of Africa to Spain, propagated everywhere by the force of the victorious sword, until, scarcely a century later, we find its promoters bearing the crescent against Charlemagne, under the shadow of the Pyrenees.

As a political and theological narrative the history of the rise of the faith of Islam, is a wonderfully interesting one, and to us it is important as it explains the reason for the geographical position of so many buildings, erected in accordance with the requirements of the new religion, and therefore having a great similarity in all countries where it prevailed.

The Kaabah, or “square house,” built by Mahomet at Mecca upon the site of a temple which tradition says was founded by Abraham, appears to have been the earliest Mahometan mosque. Mahomet had already erected a building at Medina, but this seems to have been not so much a house of prayer as a dwelling-place for his family. The Kaabah has less importance as an architectural production than as the centre of the wheel of Mahometanism, the faithful being directed to turn their faces toward it when praying, and to regard it as the ultimate goal of their wanderings.

The original structure was built by foreign workmen, and had no great pretensions, but subsequently it was surrounded by a colonnaded court, and by later additions was very considerably enlarged. Although the Koran decrees that all good Mussulmen should make a pilgrimage to Mecca, it does not uphold the Kaabah as a model to be followed in the erection of other mosques nor give any specific directions of the manner in which they should be built. It was therefore natural when the peace, following their rapid conquests, permitted the Mahometans to turn their thoughts to the erection of religious edifices, suitable for the observances of their worship, that they should borrow inspiration from the surrounding nations.

The style they eventually evolved was drawn from Byzantine, Sassanian, Greek, and Roman sources, and became native by adaptation.

In Turkey, Asia Minor, and Persia we find Mahometan mosques closely resembling Christian and Byzantine churches, many domed edifices being copied from St. Sophia and differing only in point of decoration, while the atrium or courtyard preceding the entrance to Christian buildings furnished the type for the wide colonnaded courts, with porticos roofed with a succession of hemispherical or bulbous domes, which became so common in Arabian buildings.

The mosques of Omar, at Jerusalem, on the site of the temple of Solomon, of Wallid, at Damascus, Al-Azhar, Athar-en-Neby, Ibn Touloun, and Hassan, in Cairo, are notable edifices, in which the columns are either taken or copied from Greek and Roman temples, and in which the pointed arches seem to have been suggested by the hyperbolic arches of certain ancient Sassanian structures, such as the palace of Coroes, the Takt Kesra in the ruins of Ctesiphon, on the Tigris, and the buildings of Firouzabad and Sarbistan, which were mentioned in connection with Persian art.

One of the earliest examples of the use of the pointed arch is in the Nilometer, erected on the Rodah, or Isle of Gardens, at Cairo, by Wallid, in the eighth century.

This is a matter worthy of note, as showing conclusively that the Gothic arch was no invention of the thirteenth century, in Europe, but merely the adoption of a form used five centuries before in Egypt, and probably universally known, if indeed it had ever been lost sight of, since the days of the prosperity of Babylon.

Of the early mosques the most important are those of Omar and Abd-el-Malek at Jerusalem and of Wallid at Damascus. The mosque of Omar was but a simple vaulted chamber, oriented in order to enable the faithful to turn in the direction of Mecca while praying. That of Abd-el-Malek, called the Aksah, adjoins it and is an extensive structure. It is chiefly remarkable for its general resemblance to the basilica in its division into aisles. The columns forming these carry pointed arches, built over connecting beams. It is not improbable that this design was inspired by the order of the church of the Dome of the Rock, adjoining it, built by Constantine, where the columns support circular arches, over a continuous entablature.

Wallid, Caliph of Damascus, erected a mosque on the site of the old church of St. John the Baptist, and employed labour and material in its construction furnished by Justinian, Emperor of Byzance.

The mosques of Cairo resemble each other in a great degree. They have usually a first court, giving access to apartments for the accommodation of strangers, with baths, and stables for their camels, connected with a second and larger quadrangular court, having a fountain in the centre and porticos on three sides. The fourth side, facing the entrance, has a series of aisles roofed in and forming the sanctuary, with recesses in the rear wall, where the prayers are offered. Reading-desks, provided with copies of the Koran, and hanging lamps form the chief furniture.

The minarets, one or more of which are usually erected at the angles of the building, are special features. These tall, graceful towers, from whose summits a crier calls the people to prayers five times daily, serve a purpose similar to that of the belfries and campaniles of Europe. The diameter of most of them is small in proportion to the height, giving them a slender and beautiful aspect, very distinct from another class of towers, of which the Giralda at Seville is the best known, which were conceived in the same spirit of massiveness in which the campanile in the square before St. Mark's in Venice was built. They are ascended by spiral staircases placed either within or without, and have projecting balconies at various stages.

The building materials employed by the Arabs were chiefly stone of different colours, combined in bands and patterns, and brick covered with stucco. Enamelled tiles and multicoloured marbles were used both externally and internally, while within, carved wood, gilding, painting, and plaster were lavishly employed.

Of the forms of decoration, the chief were elaborate gold inscriptions in Arabic characters, floral and geometric designs in interlaced patterns of the most intricate combinations, coloured with all the profusion suggested by the Oriental love of brilliancy and with the exquisite harmony which we see in Persian and Indian fabrics.

A favourite form of decoration was that formed by a multiplication of minute pendentives, called the honeycomb ornament, the whole surface, as well as the dome above, being covered with an agglomeration of minute niches, the effect of which is frequently compared to that of stalactites. This form of ornament was much used, particularly in the mosques and palaces of Spain.

In Cairo domestic architecture has a distinctive character of its own. The houses have reception-rooms on the ground floor, furnished with the divans, carpets, and lamps usual in Oriental manner of life, while the upper floors, occupied by the women, have projecting balconies of lattice wood-work, which permit them to see without being seen, and form an agreeable and picturesque feature on the exterior.

The richness and the progress of Arabic art at a period when architecture had sunk to the lowest ebb throughout Europe, is due in great measure to the establishment of the learned academies of Damascus, Bagdad, and other principal cities, and to the revival of Classic learning by the translation of the works of Greek authors.

In Spain, where the Moorish and Christian populations were thrown in constant contact with one another, the difference of religious opinion maintained a wide gulf between them, and while the Christians struggled with the difficulties of the Romanesque revival, their opponents attained a brilliant era in art, as a result of their superior industry and civilization.

One of the oldest Arabian buildings in Spain is the great mosque at Cordova. Here, as in the East, we find Corinthian and Composite columns, taken from Roman buildings on the soil, forming integral parts of the new structure, but the Classical principles of building are in no sense adhered to. The entablature is replaced by cinque-foiled arches with voussoirs of alternate stone and brick; a second order of columns is superposed directly upon the capitals of the first, carrying horseshoe arches, and between the two arcades an intermediary series of trefoiled arches is placed, springing from the keystone of the lower arches and divided at the centre by the upper ones.

The general plan of the building consists of the usual series of aisles, of which there are nineteen, with divisional walls. The sanctuary has a vault with intersecting ribs, surmounted by a small dome and enriched by profuse ornament, and is the object of much just admiration for its beauty.

The chapel of Villa Viciosa, a later structure, has a series of arcades similar to those before the sanctuary, differing only in the arrangement of the intermediary arches, which are carried up to the level of the upper arches from a horizontal course, and are cinque-foiled instead of trefoiled, both on the extrados and intrados.

The mosque was begun by Abd-el-Rhaman, in the eighth century, and successively added to during the four centuries following. It covers a very large superficial area, upwards of one hundred and sixty thousand square feet, and surpasses, in this respect, most European buildings. Its chief defects are the want of height, which does not exceed thirty feet, and the monotony of the aisles,

which are nearly all precisely alike.

At Toledo there are several Moorish buildings of merit, the principal one of which is the mosque called, at present, the church of “Cristo de la Luz.” It is similar to the sanctuary of Cordova in general aspect, but is a marvel of intricate and minute workmanship. The whole area which it occupies does not exceed four hundred superficial feet, but the proportions are so nicely balanced that it appears much larger. There are four columns carrying horseshoe arches, above which comes a second arcade, and each division is roofed in by a vault of intersecting ribs. These vaults are formed of wood, overlaid with plaster, and have no pretension to scientific construction. Indeed, in none of the Arabian buildings in Spain do we find anything of the kind attempted, the decorative features being always the most prominent.

In the tower of Seville a species of vault was formed by thickening the walls gradually as they rose from the ground until they met; this, however, was nothing more than extensive corbelling, and, consequently, very inferior to Roman and Byzantine methods.

The Alcázar, at Seville, and the Palace of the Alhambra, at Granada, are the richest examples of Moorish architecture, and show in their design and ornament the most fertile expression of the brilliant imagination with which this warm-blooded people imbued all its creations.

The Court of the Lions in the latter, a rectangular enclosure, surrounded by arcades, with projecting domed pavilions at the upper and lower ends, is generally held to be the finest production of the later period of the style.

The same materials are used here as in the other buildings—plaster shaped in the most exquisite forms and coloured brilliantly, tiles ornamented with patterns and devices of the most elaborate character, and wooden ceilings carved and richly painted. All these are handled with such correct taste that their brilliancy never degenerates into gaudiness.

A splendid fountain in the centre of the court, the lower bowl of which is supported upon the backs of lions, explains the name given to this celebrated structure.

The mosque of Cordova is superior, in respect to materials, to the other remaining Moorish buildings in Spain, in which plaster is used to excess. It is vain, however, to look in any of them for any distinct or novel constructional departure. The lintel and arch in Greece and Rome, the dome carried on pendentives in Byzance, were features giving character to each style, but the art of the Mahometan architects differed only in form and colour from its predecessors. The horseshoe arch with one and two centres, that is both round and pointed, was used by them almost exclusively, but it cannot rank as a constructional invention, for the real arch starts only at the level of the centres, and the remaining lower portion is a mere corbelling to obtain a form pleasing to the eye.

Any new method of construction always affected the surrounding parts, and often altered the whole design of a building. It is obvious, therefore, that a mere change in the appearance of an arch such as this, which affects nothing connected with it, cannot be said to have created any new era in the progress of building.

We hear the question frequently asked why a modern and new style is not developed in our times, and the answer architects make is illustrated by just this case, that is, that no new style can be evolved without a new constructive principle. As yet none such has been forthcoming, the only novel method of construction lately introduced being the employment of iron girders and posts, which, from an artistic point of view, can scarcely be considered an improvement upon the use of what are called the natural building materials.

IX.

THE ROMANESQUE STYLE.

Some late historians have departed from the previously generally accepted nomenclature of architectural styles, in designating under the general term of Christian architecture all buildings erected between the tenth and sixteenth centuries in Western Europe.

As, however, Christian building in Europe began with the conversion of Constantine, this chronology is hardly satisfactory, and as the customary division of Gothic from the styles preceding it, is on many grounds a convenient one, it is preferable to adopt the conventional names, and to distinguish under the title of “Romanesque” the outgrowth of the debased form of Roman architecture which, influenced by Byzantine and Arabic art, formed a distinct method of building throughout the West for nearly two centuries after the year 1000 A.D., giving it the alternative name of “Norman” in Normandy and England.

Previous to this date the long continuance of war and barbaric incursions seem to have prevented the erection of any stable edifices; fire and the poverty of the material with which they were constructed having caused the destruction of the few of which an account has been preserved.

Many churches subsequently built, however, were erected upon the sites of these older ones and have fragments of the older buildings incorporated in them. Of such are the churches of St. Germain des Prés, in Paris, and Notre Dame du Port, at Clermont.

Under Charlemagne, a revival of art was attempted, the chief building constructed by him being a reproduction of St. Vitale, of Ravenna, in which he employed sculpture and ornament torn from the original structure, and fragments from the edifices of ancient Rome; but this effort soon died away, and the period intervening between the eighth and tenth centuries was totally lacking in any architectural production of merit.

As the Roman principles of architecture had been taken Eastward and gradually transformed into a new style at Byzance, so also in the West they had been the forerunners of another method of building, but proportionately different in accordance with the character, customs, and race of the Western populations.

The basilica formed, as it had in the East, the model upon which all church architecture was designed, the nave, transept, aisles, and apse being all retained in this new class of buildings, but many of the building methods were new, and the details of their decoration differed considerably from the precise proportions and Classic graces of the buildings of Rome. The result exhibits a curious contrast between the barbaric ornament and the scientific construction, which advanced throughout the style in the genuine efforts which were made to progress in the art of building.

Starting thus at the decadence of Classic art, with a Classical building as the original type for their churches, the Romanesque architects took up each of the parts combining in its formation, and sought to improve or elaborate each, in pursuance of certain ends, arising from local necessities. There is virtually no point where Romanesque ends and Gothic commences, to give due reason for the conventional divisions of historians, for the one style melts into the other in the continual progress in the study of the principles of construction which was steadily effected throughout both styles.

They differ chiefly in that, during the two centuries prior to the thirteenth century, the pointed arch was rarely used, and that the influence of the Classic decadence is more apparent in the buildings of the earlier period. After this, the pointed arch became universal, and the whole style becoming entirely distinct from its derivation, the ornament and detail, quite unlike anything which had come before, it may be said that a new style had been created.

This new style, which has been called Gothic, continued to be developed until the fifteenth century, when its principles became exaggerated, and it died out at the extreme point to which they could be pushed.

It has been customary to call the buildings of the eleventh and twelfth centuries, built in the transition of Roman to Gothic art, Romanesque; but the pointed arch was used in both styles, though, as stated above, less frequently in the earlier one; and it should not, therefore, be taken as the distinguishing characteristic of Gothic architecture.

The chief points wherein the Romanesque churches, which were the only buildings of importance constructed at that period, differed from the basilicas were in the methods of vaulting and their consequent effects upon the whole structure, the elaboration of the apse, and the system of connected supports employed. The main characteristics of the style were the same in all Western countries, and these being known, it is not difficult to distinguish the slight differences arising from local causes.

In the old basilicas the aisles, whether of one or two stories, were lighted by windows in the lateral walls, while the nave borrowed light from them, and also received it directly from a clerestory rising above the roof of the galleries. As we have seen, these buildings were usually covered by wooden roofs, tunnel-vaults or a series of intersecting vaults thrown across the square formed by two of the columns of the nave, equidistant from each other and from corresponding pilasters in the side walls, being only occasionally used in the aisles.

The Western architects of the tenth century continued to build their churches in this manner, and we have a splendid example of a timber roof of this kind, as late even as the twelfth century, in Peterborough Cathedral; but at an early period they sought to replace these perishable roofs by stone vaults. They found the construction of the semi-dome of the apse and the vaulting of the side aisles, either by a continuous tunnel-vault, by a series of semicircular vaults perpendicular to the lateral walls, or by intersecting vaults upon a square plan, comparatively easy; but the vaulting of the nave was a much more difficult matter.

The circular tunnel-vault would have been the simplest known method of accomplishing this, but the pressure of a circular vault placed over the nave would have tended to push outward the walls upon which it rested, and this pressure being continuous, it was obviously of no avail to place buttresses at any separate point, and to place a great number, side by side, all along the vault, or, in other words, to greatly thicken the supporting wall, was to take up too much valuable ground space.

In St. Front and kindred structures we have seen the problem solved in one way by the introduction of Byzantine domes; but these churches were confined to a province of Southern France, and had but little influence in other districts. In St. Etienne de Nevers, St. Sernin de Toulouse, and in Notre Dame du Port at Clermont in Auvergne, and others, this difficulty is partially overcome by the building of a half vault over the upper galleries connecting the tunnel-vault of the nave with the outer main walls, and taking the strain continuously, the thickness of the outer wall not being considered of consequence. This system permitted the placing of roofing-tiles directly upon the extrados of the vaults, and the entire suppression of wooden rafters, which was advantageous in diminishing the risk of fire, although the pitch was scarcely sufficient to prevent leakage. The great disadvantage, however, was that the nave had only borrowed light, and in large churches it was inconveniently dark.

Another method adopted was that of suppressing the upper gallery, and bringing the arches of the aisles up to the level of the springing of the main vault, so that the summits of the side vaults and the walls erected between them, which were at right angles to the nave, served to counteract the strain of the upper vault. We have examples of this in the cathedral of Limoges and at Fontenay, but it is open to the same objection, that of darkening the nave.

Still another system consisted in binding the vault over the nave by ribs or arches thrown across to opposite piers, which were strengthened by buttresses. These buttresses, however, were built upon the top of the arches, thrown across the aisles, and did more harm than good.

[Illustration: ELEVATION.

ROMANESQUE CONSTRUCTION]

[Illustration: SECTION.]

There is an example of unusual construction at Tournus, in Burgundy, where the difficulty is effectually surmounted by the building of a number of arches at right angles to the axis of the nave, between each set of piers; but the effect is far from satisfactory.

Finally at Vezelay, in France, the tunnel-vault was abandoned and diagonal intersecting vaults were thrown across the nave, framed in between semicircular arch ribs carried upon piers spaced at equal intervals, the weight being thus wholly transferred to the four points at the angles of each compartment. It was found, however, that these piers needed strengthening, as the strain upon them was excessive, and it was thus that external buttresses were resorted to, which were connected with the piers by arches, called flying buttresses, bridging the side aisles and conveying the pressure to the outer wall. A weight was placed over each buttress, generally taking the form of a pinnacle, which stiffened it and counteracted the pressure of the arch.

An illustration of this mode of construction has been attempted in the accompanying drawing, which does not represent any special building, but in which the chief characteristics of the style at this juncture have been introduced.

The distance across the nave being usually greater than that between the columns dividing it from the aisles, the rectangular compartments of the vault were consequently no longer square, but oblong, so that while the arches crossing the nave at right angles were still semicircular those between the pillars were pointed.

The transition from this, in the thirteenth century, to the definite adoption of the pointed vault was consequently but a step.

We see, thus, that a continual progress was made in vaulting throughout the style, and the principle of concentrating weight upon isolated points was evolved in order to vault the nave and at the same time give direct light to it. In effecting this result, however, the original aim had been lost sight of—namely, that of avoiding the use of wooden roofs; for when the Romanesque architects abandoned tunnel-vaulting they had to surmount their more complicated intersecting vaults by wooden roofs, the perishable nature of which caused the ruin of many of the finest buildings. Nor was the external appearance of these roofs any improvement upon those of St. Etienne and St. Sernin, for it is a question whether any more monumental roof has been conceived than that which is formed by the natural outside surface of stone vaults.

In the old basilicas, columns taken from or modelled upon those of the temples and palaces of Rome had sufficed to support the light brick wall, carried upon an architrave or arches, which enclosed the nave. When the Western architects resumed the building of churches, after an interval of war and trouble which had proved fatal to architectural progress, brick was little used and the formation of light masonry and good mortar were lost arts. The slender Classic column was consequently insufficient to carry the load of a heavy stone wall and had, necessarily, to be replaced by a more solid pier.

These piers assumed various forms in the tentative efforts made to construct them of the dimensions calculated to occupy the least amount of floor space; some were square, others circular or formed of a number of small columns grouped together, but for a long time no very satisfactory shape was found which avoided a clumsy adjustment of the superstructure.

It came to be gradually recognized that the form of the pier should be subservient to, and made to correspond with, the arches and the column receiving the arch rib of the vault above, which it had to sustain. This was effected at first by a square pier, with rectangular projections on each side, forming abutments for the reception of the constructional arrangement above. Subsequently these were replaced by pilasters and engaged columns on each face, three of which supported the rear and side arches of the nave, the fourth being continued up to the springing of the vault, and redeemed from exaggerated effect by bands or string-courses. There are good examples in France at Vezelay, Beaune and Langres and Autun. In England the contemporary architects usually employed square or circular masses of solid masonry, carrying a heavy abacus, these pillars being sometimes ornamented with a fluting, as in the crypt at Canterbury, or with zigzag patterns, as at Waltham Abbey, Durham, and Lindisfarne.

The capitals of Romanesque columns are especially interesting, for they became constructively useful instead of simply ornamental, as were those used in the Roman orders. The section of the arch rib being square and the column round, it was necessary to afford support to the overlapping corners, the whole surface of the projecting tile or abacus being occupied by the upper masonry, instead of the line of the shaft being continued up, as had been done in Rome. The capital was therefore made to spread outward from the shaft in order to corbel the superstructure.

2. Roman Arch, showing False Lintel. 3. Vault Springing from Entablature. 4. Arch Springing 5. Romanesque Column, with Arches Springing from Outer Edge of the Capital. 6. Romanesque Pier. 7. Gothic Pier.]

A simple form of this is found in many German, Italian, and English examples, the upper part of the capital being a cube and the lower a hemisphere. The early examples generally imitate those of the Corinthian order in a rude fashion corresponding with the poverty of talent of the period. The capitals of the twelfth century are better carved and better suited to the services they have to perform. Figures representing biblical subjects are introduced in some and in others strange animals and conventional foliage, sometimes arranged as the acanthus leaf had been in the Roman models. The proportions of the Classic column were also departed from, the capital often being a quarter or a sixth of the whole column; its height being regulated by the size of the beds of stone, which were generally low. In Germany, however, the older proportions were more closely adhered to. The quality of the stone determined in a great measure the depth of the carving, the harder kinds having less depth of incision and the style of ornament applied to them resembling the Byzantine.

In France the Romanesque column has usually a third of the diameter of its shaft engaged in a pier or wall, though isolated ones are used in the triforiums, towers, and porches; in England the latter are common, and recessed columns, that is to say, placed in an angle of masonry, are also frequently seen.

The bases of Romanesque columns, at first simple round and hollow moulds, gradually became more elaborate, until they resembled the attic base. Occasionally they were decorated with foliage or animals, and there are instances where both capital and base are similar. The introduction of an angle ornament, connecting the torus or round mould with the corners of the plinth beneath, is especially noticeable; this was effective in preventing the angles from being broken by thickening the stone at the weakest points, and in later examples added to the beauty of the base.

The arches of the period were usually semicircular and employed either separately or with a second and broader one, their contour being frequently marked by a few simple mouldings of degenerate classic origin.

Two or three arches supported by detached columns, and comprised within a larger one, were frequently placed in the triforiums; when three were used the central one was usually higher than the others. Besides mouldings: billets, zigzags, stars, and similar simple ornaments were employed in their decoration. Where Arabic taste exercised its influence, it is not uncommon to find alternate voussoirs of different-coloured stones, and variegated bands in the piers.

The Italians were especially fond of this treatment and it is seen in the exteriors and interiors of many of their buildings. To them is also due the introduction of blind arcades, the columns of which were either engaged in the wall or separated from it by an intervening gallery. The façade of the cathedral at Pisa is perhaps the most beautiful example of this.

In the West, arcades of this kind became a frequent method of decorating blank walls, and there are instances where a second series of arches intersect the first, resulting in a number of pointed arches formed by the crossing of the circular ones; from this an ingenious but unfounded theory has been deducted purporting to explain the origin of Gothic architecture.

The doors and porches of the Romanesque period are among the most beautiful to be found in any style. Starting in the earlier examples with a simple, round-arched opening, the number of mouldings in the arch became richer and of greater number, and, as the style advanced, recessed and supported by columns. These mouldings were decorated with the zigzag, billet, and kindred ornaments, many of which were probably copied from the decoration of the old basilica of St. Paul's without the walls of Rome.

As the jambs of the doorways were generally built on an angle, the contiguous shafts and arches sometimes gave the effect of an arched passage in perspective. Such effects were frequently intentional in the churches in Southern France, for we find that the walls of the nave and vault of Notre Dame de Poitiers, and of other buildings, were purposely made to converge in order to give the appearance of greater length.

It was not uncommon to give the doors square heads, supported by corbels and occasionally by a central shaft; in these cases the arch above relieved the lintel from the weight of the superstructure, and gave the character of the style to the whole. The tympanum, thus enclosed, offered a ground for rich sculpture, which was availed of to the fullest extent. The outer door of a porch was usually richer in design than the inner one; in England there are many examples of shallow porches with single deeply recessed doors. In Provence there are many beautiful examples, foremost amongst which must be mentioned the porch of St. Trophyme, at Arles (see frontispiece). Romanesque windows were but modifications of the doors; often having recessed shafts at their sides and being frequently divided by a central column.

The bull's-eye, or round window, of the early Christian basilicas continued to be used, but it had not as yet the richness of tracery which it attained in the Gothic period.

Classical features of design still retained their hold upon many details, notably in the cornices, where the modillions or brackets of the Corinthian order were frequently employed, and but slightly altered in form, although of native composition. The corona of the cornice also differed but little from the Roman models, and was occasionally supported directly by engaged columns replacing buttresses, chiefly on the exterior of apsidal chapels.

In the early Christian churches the apse had consisted of a central semicircular termination to the building, flanked occasionally by two smaller semicircular recesses containing altars. In the baptisteries and Byzantine churches these had been multiplied, and had come to be customary features in every new building. In England, the Norman architects generally ended their churches rectangularly, without even the original single apse, though there are a few examples in which it is used, as at Newhaven, Sussex. In Germany it was frequently the custom to affix apses to three sides of the square tower placed at the intersection of the nave and transept, and the result was generally satisfactory, as may be seen in St. Martin's of Cologne, and in the Apostles' Church in the same city.

[Illustration: PLAN OF STRASBOURG CATHEDRAL (Compare with Basilica, page 89.)]

In France the plan resolved itself into an open semicircular colonnade with a passage intervening between it and the outer wall which followed the outline of a series of small apses. These formed an harmonious cluster, and became a type which was matured in the thirteenth and fourteenth centuries. Those belonging to the Romanesque period, however, had a distinct and constructively excellent character which has rarely been subsequently surpassed. Among the best are those of Notre Dame du Port at Clermont, St. Etienne de Nevers, and St. Sernin at Toulouse.

In France towers were generally placed at the West end of the church, while in England and Germany the usual way was to build them at the junction of the nave and transept; in Italy they were often detached from the main structure. They were characterized by simple solidity; the openings being few and the detail bold; the angles were strengthened by stout piers; the roofs were either of timber or stone, according to the nature of the materials in the localities in which they were erected, and they were usually lighted by the round-arched double window. This round arch, ornamented with a few simple mouldings and reposing upon short sturdy columns, forms a constantly recurring feature in the composition of the several parts of Romanesque buildings.

The corridors which surrounded the square courtyards adjoining churches, and connected them with the dormitories, refectories, and other apartments of the clergy, are called cloisters. They differed but little from the Roman “impluvium” and the “atrium” of the basilica, the changes consisting chiefly in the addition of raised sills separating them from the court, and in their being usually vaulted instead of carrying timber roofs. The series of arcades forming them were treated in many ways, and the detail admitted of much elaboration and variety, as may be seen in the many remarkable examples throughout Europe. The cloisters of St. Paul’s, at Rome, and the atrium of St. Ambrogio, at Milan, form very interesting historical links between the Roman and Romanesque styles and are very beautiful specimens of their kind.

It had been the custom during the struggling period of the early Church to bury the bodies of saints in subterranean chambers called crypts, a word derived from the Greek verb “to hide”; subsequently these became component parts of all churches, serving as places of interment and for the occasional celebration of masses. Their masonry was necessarily of the massive character required for the foundation of the piers of the church above, consisting generally in a grouping of columns sustaining a heavy vault.

[Illustration: CHEVET OF NOTRE DAME DU PORT AT CLERMONT.

(_From Chapuy._)]

The crypt of St. Eutrope, at Saintes in France, may be mentioned as one of the best examples, the pillars being richly carved, and the ribs of the vault of great boldness and strength.

In Germany the crypt is often raised sufficiently above the level of the ground to obtain light from windows, as at Spires, and this is sometimes carried to such an extreme that the church becomes double, that is, of two stories, as at Schwartz Rheindorf.

In England, Canterbury Cathedral possesses perhaps the best example, the crypt being very large and its details varied. Some of the capitals of the columns remain half finished, the work upon them having been arrested by a conflagration in the twelfth century.

X.

GOTHIC ARCHITECTURE.

Briefly recapitulating the preceding chapters: We have seen that the Greek temple, composed of a cella, or oblong room, surrounded by a colonnade, was copied by the Romans with but few alterations, the only one of importance being the addition of a semicircular recess to the rear wall. The columns of the colonnade having been transposed from the outside to the interior, dividing the room in three parts, longitudinally; a cross wall having been introduced dividing it transversely, and the apse retained, the building became a basilica. By extending the transept and nave the plan became cruciform and symbolically the most suitable for that of a Christian church.

The Western architects, desiring to replace the wooden roofs by stone vaults, found it convenient to substitute for columns carrying arches, piers with engaged shafts connecting directly with the superstructure.

After various attempts to obtain direct light for the central division or nave, rendered difficult by the necessity of counteracting the continuous thrust of the barrel vault thrown across it, this vault was finally abandoned and replaced by intersecting vaults, which conveyed the thrust diagonally upon equidistant piers. To avoid increasing the size of the latter to an inconvenient extent, an expedient was resorted to which consisted in propping them from the exterior by flying buttresses thrown from them to outside piers across the roof of the aisles. The result of the width of the nave being usually greater than the distance between piers was that, while the diagonal ribs of the vault remained semicircular, their lateral intersection produced pointed arches.

This form of construction was developed during the middle and latter half of the twelfth century. The pointed arch had been used occasionally before by the Romanesque architects; it had been used frequently by the Arabs, as far back as the eighth century, and

had been known and employed long before the Christian era in the sewers of Babylon. It was, therefore, not a new invention, but a known method adopted in a fresh departure in constructive architecture; for the circular arches being abandoned and definitely replaced by the pointed arch the succeeding architecture became pointed or Gothic.

This is the condensed history of the derivation of the style as generally accepted at the present day, though the subject has given rise to much controversy.

The concentration of the weight of the vault upon the piers, instead of upon a continuous wall, was more or less the key to the whole scheme of Gothic construction; for the main principle remained the same throughout its many and varied examples. The idea was improved upon gradually and finally pushed to exaggeration; the decoration of the component parts of a building increased as the style advanced and they were reduced to just the sizes needed for stability, but their construction remained almost unaltered throughout.

We have followed the steps by which the form given to Christian churches emanated from the early basilicas; this form of building, that is, its plan and divisions into nave, aisles, transept, choir, apse, etc., had become traditional and was generally accepted in all the best examples.

[Illustration: PLAN OF RHEIMS CATHEDRAL.]

The problem of accommodating large assemblies in the manner best suited to enable them to concentrate their sight and hearing upon a given point has been solved in various ways, perhaps most successfully in our modern opera-houses, but this problem was not one with which the Gothic architects endeavoured to grapple; their attention was devoted to the improvement and embellishment of the typical plan of structure, which custom and dogma had prescribed as the most suitable and in accordance with the needs of the liturgy. The plan was more or less elastic, and differed without material distinction in the different countries of Western Europe. These differences are easily noted by comparing the appended plans; the one, that of Rheims Cathedral, showing perhaps the most perfect arrangement of any in France, and the other, that of a typical English cathedral. The latter does not represent any particular structure, but is a composition including all the usual divisions and connecting buildings, taken from an old copy of Rickman.

_a_, _a_, Towers at West end. _b_, _b_, Porches. _c_, The nave. _d_, _d_, Side aisles of the nave. _e_, The cloisters. _f_, Library. _g_, North transept. _h_, South transept. _i_, _i_, Side aisles of South transept. _k_, _k_, _k_, Chapels. _l_, Chapter house with passage from the cloisters. _m_, Central tower, cross or lantern. _n_, Screen, over which the organ is usually placed. _o_, Choir, at the east end of which the altar is usually placed. _p_, _p_, Side aisles of the choir. _q_, Lady chapel.

In the thirteenth century the style was formed in all its purity; it was characterized by great simplicity and beauty, and in these respects was never surpassed. The arch had few mouldings, and these clearly defined and graceful; the shafts of columns were of slender and charming proportions, and the foliage employed for the decoration of their capitals, while conventional, departed entirely from the acanthus leaves of Classic origin, and assumed forms suggested by Western plants. Piers were reduced to the precise dimensions needful, and were formed of slender shafts, grouped together, which received the arch mouldings on either side, and rose in the front and rear to the height necessary to take the springing of the vault. In practice, the thrust of the vault was found not to be transmitted directly to a point to be received by an arch, but to two points above and below this theoretical one, which necessitated the employment of two flying buttresses, the one above the other. In Chartres Cathedral these are connected by radiating columns, and there are many examples where the intervening space is occupied by an open arcade. The French generally built their vertical buttresses very massively, but in England the pinnacle was more frequently used to counteract the thrust of the arch. For this purpose it was eminently appropriate, and might be considered ornamental, but the placing of pinnacles upon the corners of the towers and elsewhere where they served no end, which was often done, was always a mistake; and a defect which mars the effect of many beautiful English buildings.

In Notre Dame of Paris, we find the single round column still occupying the first story, with the more complex arrangement of pier and connected shafts starting above the abacus of its capital, but as a general thing, a distinct shaft was provided for each set of mouldings. In time this was replaced by a continuation of the vault mouldings down to the floor, interrupted only by an occasional string-course, or a band of foliage replacing the capital.

[Illustration: PLAN OF AN ENGLISH CATHEDRAL.

(_From Rickman._)]

Once the weight of the vault had been transferred to piers, the wall connecting them ceased to support anything but the extremity of the cross-vault comprised between the piers, and otherwise served only as a screen. The Gothic architects soon took advantage of this to widen the windows, which had been narrow in the early stages, for by throwing a discharging arch just under the upper vault across the piers the whole space underneath could be occupied by windows, which, with the improvement in the making of painted glass, became extremely desirable. This was accordingly done, the only stonework left being the network of mullions and tracery necessary to receive the panes. This tracery, probably suggested by the rich Arabic window fillings, made a great advance during the latter part of the thirteenth and fourteenth centuries, the combinations of geometrical figures, chiefly the circle, being often wonderfully beautiful. The rose window was much favoured by the French in their West fronts and transepts, but in England the large pointed window was generally preferred, and admirably suited the square termination of the apse, which was the most frequently used in that country.

The space enclosed by the pointed window had an outline to which it was always difficult to adjust geometric traceries so as to avoid clumsy joints, or oddly shaped patterns, and these were, therefore, subsequently replaced by flowing lines, which could be used with much greater freedom.

As these grew bolder they assumed a flame-like appearance, and the later period of the style to which they belong was, in consequence, called “Flamboyant.” This development occurred chiefly in France, some of the best examples being in the church of St. Ouen, at Rouen.

The simplest form of the Gothic vault was that in which the compartment comprised between two piers on one side and two on the opposite side of the nave was marked by two ribs bridging it, and two diagonal ribs intersecting each other. As the system advanced the vault became more complex by the addition of other ribs, as strengtheners or as ornaments, until in some examples the whole vault became a network of intersecting ribs.

These intersections were frequently emphasized by a keystone or by an ornament called a boss, which in English work was also placed at intervals along string-courses, breaking the continuity after the manner of modillions in Classic cornices.

A keystone placed in the centre of a vault was held there by a combination of great strength, as it became a point of abutment for all the main ribs, whose thrust was distributed against four piers and hence exteriorly by buttresses to the ground. A good stone, therefore, in this position could have extraordinary dimensions, and was susceptible of a variety of treatment. In some French examples it was extended, or rather hung, considerably below the surface of the vault and ornamentally carved, while in England, in the late so-called Perpendicular Gothic, it formed the centre of a large pendant, or circular hanging ornament, which in some cases came down almost to the level of the springing of the ribs.

This construction was used chiefly in connection with the fan-vaulting, in which English architects excelled, which may indeed be said to be an English invention and monopoly, as no examples of it are found elsewhere. The name explains, in measure, the form taken by the ribs, which, spreading out from the sheaf of mouldings in the pier, trace a perfect semicircle on the upper ceiling, their intervening spaces being occupied by panels. The four semicircles thus traced by the ribs, starting from four piers of a compartment, are each tangent to a central and whole circle forming the contour of the pendant.

To be successful this requires that the compartment or space included between four piers, two on each side of the nave or choir, should be a square, otherwise the circles do not touch, and the lines are inharmonious.

The chapels of Henry the Seventh, at Westminster, and of St. George, at Windsor, contain the best examples of fan-vaulting, and are very beautiful in general effect, though it is questionable whether such constructive tricks are worthy of unrestricted praise, while the abuse of panelling in which English architects indulged in these later Gothic buildings, by which the whole wall and ceiling surface was cut up in an unending repetition, was certainly blameworthy, and tended to reduce their art to a mechanical science.

They excelled, however, in all mechanical workmanship, in which perhaps that employed in the execution of timber roofs is the most remarkable. These were in a measure, at least upon so large a scale, a feature wholly English, for nothing approaching them is found elsewhere. The roof of Westminster Hall is the most justly celebrated and is unique in general character.

The natural stonework showing all its joints was generally left untouched in the interior of Gothic buildings, and afforded the best finish as well as contrast to the stained glass in the windows.

Polychrome decoration was attempted occasionally, chiefly on the Continent, and in some instances successfully. The best examples are the restorations of the Ste. Chapelle and St. Germain des Prés, in Paris, though the latter belongs more properly to the Romanesque period. Many churches have been completely spoiled as regards their inside appearance by coats of whitewash applied to the whole interior surface, giving them a bleak and barn-like aspect fatal to architectural effect; this is especially frequent in Belgium.

This whitewash, coupled with horribly incongruous late Renaissance decoration, has gone far in many cases to ruin what would otherwise be fine buildings.

Externally all _good_ Gothic buildings showed a direct correspondence with the interior: buttresses, flying buttresses, pinnacles, etc., were all constructive and never decorative devices; there was never such a thing as a façade or false front built independently of the interior, and though the harmony of the lines of both were often difficult to reconcile, it was just in the overcoming of such difficulties that the brilliant qualities of Gothic architects were called forth.

In the arrangement of the West fronts the French were at their best, for the combination of deeply recessed porches with the rose window and gable above, flanked by the towers, which in France were usually placed here, was both judicious and effective. In England such porches as those of Rheims, or deep openings, such as the entrances to the cathedral of Paris, were not used, and the West elevations are consequently less interesting. Peterborough is an exception to this rule, but the design is so exaggerated, that the three immense arcades dwarf everything connected with them.

The custom of placing a tower and spire over the intersection of the nave and transept was always adhered to in England, and was always a happy arrangement which gave the building dignity and character, even when the Western towers were omitted. Of this the celebrated Salisbury Cathedral is a beautiful example.

The spires of Chartres and of St. Ouen, at Rouen, are the finest in France, where towers were frequently built to receive spires which were never added. The height to which the nave was carried there often prevented the towers from having their due effect, as it was impossible to carry them out on a scale large enough to give them a corresponding proportion. English architects contented themselves with moderate interior heights, rendering the proportioning of their buildings a much easier task than that which their neighbours imposed upon themselves, by attempting with each new building a more daring altitude, until the crumbling vaults of Beauvais set a limit to their audacity.

The comparison of contemporary Gothic in England and France covers the subject more accurately than between that of any other countries, for these two nations rivalled each other all along in the solution of the various problems which arose with each step in their progress, while the architects of other countries profited by the results they attained and erected their buildings on Anglo-French principles.

The cathedrals of Cologne, in Germany, and Toledo, in Spain, are as fine as any to be found in France or England, but they are neither German nor Spanish in conception and principle, and therefore do not belong to the national architecture of these countries. In Italy, Gothic architecture was never understood as it was in the North, and whenever anything was attempted in direct imitation of Northern principles of design, the result was always hard and mechanical. The true Italian Gothic was of itself often beautiful, but this was almost a separate style, in which the influences of pointed forms, Oriental colour, and the example which the Classical ruins held out so conspicuously on their own soil, were brought together by the Italians so as to form an harmonious whole.

In Venice a peculiar development of the style was attained, adapted to the flat elevations of the canal palaces. This arrangement consisted of a consecutive series of arcades, in which the mouldings of each arch were carried up and returned, forming a second and sometimes a third row of lights, replacing, in the play of light and shadow, the forced absence of projections.

These arcades were surmounted by horizontal mouldings, and the lines of the cornices and imposts were also horizontal, the Italians never having lost sight of the entablature, which had been dropped in France with the rise of Romanesque architecture and replaced always afterward by the vertical lines which are the prominent one sin of all Northern Gothic buildings.

The celebrated Doge’s palace is the foremost of these and ranks amongst the most picturesque buildings in Europe. It is not free, however, from grave defects and is criticised by architects for the top-heavy and injudicious construction, by which a high and rarely pierced wall is sustained by the slenderest of arcades.

Most of these palaces are of the fifteenth century and should not perhaps be mentioned first, but as they illustrate the principle of horizontal lines more readily than by reference to the isolated parts of less well-known buildings, they are introduced now.

Although Milan Cathedral is one of the largest and most pretentious ecclesiastical buildings in Italy, it is scarcely a good example of Italian Gothic, for German architects were employed in its construction and their influence is apparent. It is rather to the Cathedral of Sienna that we should turn for a complete typical Italian structure. Here we find a beautiful building and yet one which can in no way be judged from a Northern standard. The West front has three porches, but their recessed arches are round instead of pointed, although the detail is Gothic (the church having been begun in the middle of the thirteenth century); above is a rose window, but, unlike the Western models, without dividing tracery. Both the exterior and interior are striped with alternate bands of black and white marble. The intersection of the nave and transept is covered by a dome, a feature unknown in France or England (with the single exception of the wooden one in the cathedral of Ely), and the tower or campanile is placed in the angle of the South transept. These points are all essentially different from Northern treatment, in which some of them would be considered defects. Here, however, the parts are sufficiently harmoniously united to produce a whole which is pleasing and original. The cathedral of Sienna has much in addition to these to make it interesting: attached to it is a library—a later building, beautifully decorated in a style similar to the Loggie of Raphael in the Vatican; the stalls of the choir are of carved wood, of the richest Renaissance design, and the pulpit, by Nicholas Pisano, is a gem of sculpture. This pulpit is octagonal; its sides are carved in high relief in representation of Scriptural scenes, and it is supported by polished columns carrying trefoiled arches and resting upon marble lions in lieu of bases. As a work in which both sculpture and architecture combine, it is, on a small scale, one of the most beautiful productions of its kind, essentially Italian, and rivalled only by that in the baptistery of Pisa by the same artist.

The body of a lion as the base of a column was a favourite device of Italian architects, and is frequently met with. Porches formed of columns carrying a round arch and gable and resting on lions, are often attached to the entrance of churches.

Orvieto Cathedral is, on a smaller scale, similar to the neighbouring cathedral of Sienna. The West front is designed with most elaborate detail and highly ornamented with painting and sculpture. The Duomo of Florence partakes also of the general characteristics of Sienna, although its proportions are vastly larger. Its most striking feature is the great dome, added by Brunelleschi, when the church, designed by Arnolfo, was approaching completion; but it is unsatisfactory, as its immense size dwarfs the rest of the building. The general picturesqueness of outline, the delicate design of the doors and windows, and the proximity of the beautiful tower of Giotto, go far to atone for this. The exterior walls of the church are covered with a veneering of coloured marbles, which, while judiciously treated and good of its kind, is too false to be easily reconciled to true artistic principles, and its skin-deep beauty has been painfully apparent, until very recently, owing to the unfinished condition of the West front.

It may be said in extenuation of this that plaster, while generally accepted as an honest material, is no less a shallow covering to disguise naked walls; it is, however, frequently misused, and is only tolerable so long as it is not employed in imitation of better materials, while the thin marble is really intended to deceive the eye, and give the impression that its depth is equal to that of the wall.

The interior of the Florence Cathedral is disappointing, it is insufficiently lighted, bare, and much in need of the frescos with which it was originally intended to be decorated.

The cathedral of Pisa belongs in greater part to the preceding style, but the campo-santo adjoining it has a cloister with traceried windows, which, notwithstanding its round arches, more nearly resembles Northern Gothic than anything in Italy, and by its greater height shows a novel and more effective treatment than is usually seen in France or England.

The little church of St. Maria della Spina in this town, on the banks of the Arno, is a charming little edifice of the Sienna type.

In civil architecture Italy has much to boast of. Her palaces and fortresses are amongst the noblest and most picturesque buildings of the Middle Ages found anywhere in Europe. Most of these are rectangular masses of stone, the austerity of which is relieved by heavy window-openings with pointed heads and moulded frames, and crowned by a battlemented cornice, occasionally enlivened by shields placed between alternate corbels. The addition of the campanile, used as a lookout tower rather than as a belfry, generally completes an imposing structure.

Of those in stone, the Palazzo Vecchio and the Bargello, in Florence, are among the finest of these half town-hall, half fortress buildings, while the Municipio of Sienna, with its immensely high campanile, may be mentioned as typical of those in brick. Nearly every large city possesses one of these tall towers, notably Verona, Cremona, Mantua, and Florence. In the last-named the tower

of Giotto is the most highly ornamented and graceful of this class of structure, and for general proportions unsurpassed. Longfellow, in his well-known poem, regrets the lack of a spire to complete it, but it is questionable whether such an addition could have been made in keeping with the style in which it is designed.

In France the lately restored Chateau de Pierrefonds, near Compiegne, illustrates, perhaps as well as any, the typical military building of the Gothic period, with all the usual accompanying structures. The exterior walls are high and massive, with round towers at the angles crowned with projecting battlements and conical roofs. An interior court is reached only by traversing a drawbridge and passing through an outer gate and passage defended by heavy portcullis. Around this court are grouped the apartments, banqueting-halls, the chapel, and the necessary quarters for residents and garrison.

The number of remaining domestic buildings of the period is comparatively limited. The house of Jacques Coeur at Bourges, the monastic Hotel de Cluny, in Paris, the Palais de Justice, and the Hotel Bourgtheroulde, in Rouen, may be mentioned among the few still standing, as the best examples of contemporary architecture.

Of small half-timbered houses there remain a fair number in France, though they are daily being demolished, in the principal cities, to make way for so-called improvements.

England is rich in military and civil buildings: the castles of Windsor, Warwick, Kenilworth, Rochester, and the Tower of London, are all well known and have been frequently described. Perhaps the most interesting of English civil structures of the Middle Ages, are the colleges at Oxford; as, however, they follow, in the Gothic treatment, the progress of the styles, as illustrated in the contemporary ecclesiastical edifices, they do not require special description.

The town-halls of Belgium are important Gothic buildings, and are found in all the principal cities of that country. Their flat façades are singularly rich, but as they embody only the forms and ornament of Gothic art, they are less interesting and poorer examples than any less pretentious structures showing the constructive element, which predominated in the Gothic style.

Toward the close of the style, and before the rebirth of Classic art had completely superseded Gothic architecture, a curious transitional style had a brief sway, in which both were blended. The wing of the Chateau de Blois, built by Louis XII., and the Chateau de Gaillon, built by Cardinal Amboise, in the year 1500, the façade of which is now preserved in the courtyard of the Ecole des Beaux Arts, may be regarded as the best specimens of this charming and short-lived art. The churches of St. Etienne du Mont, and St. Eustache, at Paris, may be added to these as typical of the contemporary religious edifices.

In them we see the last throes of a dying style which had become extravagant and distorted in its final efforts to survive, but retained traces of its former beauty even in its expiring moments.

The Gothic style arose in the latter half of the twelfth century, it attained its greatest purity and simplicity in the thirteenth; during the fourteenth a more extensive use of ornament was introduced, in consequence of which it has been termed Decorated Gothic; finally, in the fifteenth, its principles and principal features were exaggerated and pushed to their utmost limits, until its brilliancy, flickering in the flamboyant traceries of the latest period, expired and gave place to a Classic revival.

XI.

THE RENAISSANCE.

A not uncommon error is made in applying the name Renaissance only to the delicately treated style of revived Classic art, such as was prevalent in France during the reigns of Francis the First, and his immediate successors.

The word—derived from the verb _renaître_, signifying in French the rebirth (of the classics understood)—cannot, however, be confined to any such narrowed limits, for no new style having been substituted since, it is as correct a term to-day as it was in the sixteenth century. There is certainly a distinction between the first brilliant productions of the revival, and the more ponderous buildings which succeeded them, but Early and Late Renaissance express this satisfactorily. It did not always follow, however, that all the work which, from its characteristics, would be classified under the first head, necessarily antedated that belonging to the later period.

In Italy, where the works of the Romans were too colossal to be utterly destroyed, and too conspicuous to be easily forgotten, the first movement naturally took place to reawaken the long dormant art, by which they had been produced.

In the fifteenth century Orcagua built the Loggia dei Lanzi, in Florence, and boldly substituted round arches for the pointed ones then in vogue. This was the turning-point in the tide of Gothic architecture, for it needed but little more to induce the delighted Italians to throw off the yoke of an art which they had adopted but unwillingly, and which had never been sympathetic to their taste. Consistently with their impetuous nature, the change was effected without hesitation in a marvellously short period, and with scarcely any of the usual intervening transitional stages. The ancient forms reappeared and replaced the dying Gothic as rapidly as in the days of the French monarchy the cry “Le roi est mort. Vive le roi!” heralded at once the king’s death and his son’s succession to power.

It is strange that there should have been so little to connect the succeeding styles, that the revival should have been so completely independent of and uninfluenced by a style which had been steadily growing for four centuries, and which men must have become accustomed to consider the only one suited to their times. Delicate workmanship was, however, the only Gothic legacy the Renaissance architects accepted, and this was the chief characteristic of the work of the early period. The proportions and scale of their buildings were small; a whole order: pedestal, column, and entablature generally occupying and marking the height of an ordinary story of fifteen or twenty feet, and the ornament used, while profuse, was executed in the lowest relief and with most minute detail.

If the revolution in art was great, it had proportionately great exponents: Brunelleschi, Bramante, Raphael, Sangallo, Vignola, Michael Angelo are names as prominent in history as those of much-lauded victors in the battlefield.

Brunelleschi, architect of the dome of St. Mary’s in Florence, was one of the earliest innovators. He designed the Strozzi and Pitti Palaces in that city, with the horizontal lines and round arches of the Classic school, although still retaining the feudal traditions in their massive stonework and in the austerity of their exteriors. The great palaces of Rome which belong to this period partake also of this external severity, and confine their brilliancy to interior display. The palaces of the Cancelleria by Bramante, the Palazzo Massini by Balthasar Perruzzi, of Sienna, the Sacchetti and Corsini Palaces by Sangallo, the Barberini designed by Bernini, and the Farnese Palace upon which Sangallo, Vignola, and Michael Angelo devoted their labors in turn, are a few among the most celebrated.

Most of these buildings, while varying in size and in accordance with the character of their sites, are rectangular in plan, and enclose quadrangular courts, the different stories being marked by superposed orders and arcades. They are planned on a liberal scale, with broad proportions and with great deference to symmetry. The beauty of the plan was, in fact, one of the best features of the new style, not only in domestic, but in ecclesiastical architecture, for the arbitrary Gothic arrangements being once discarded, it became possible to combine the circle and straight line in many novel and beautiful ways, for which the older Roman buildings furnished admirable examples. The study of these plans forms one of the most important elements in an architect’s education, and their examination in these days of iron props and twelve-inch walls is fraught with much pleasure and profit.

The light and brilliant creations of the early period are abundant in Northern Italy, and were models with which the French were readily impressed. The façade of the church in the Certosa of Pavia, with its elaborate detail and delicate ornament, and such buildings as the Spinelli Rezzonico and Vendramin palaces, the church of St. Zachariah, the Logetta and Library of St Mark’s of Sansovino, in Venice, and farther South the Palazzo Fava in Bologna, the Capella Pazzi attached to the older Sta. Croce in Florence, and the monument to Julius II. in Sta. Maria del Popolo in Rome are a few beautiful examples of the early treatment which has so much affinity with the works produced in France under the Valois.

[Illustration: PLAN OF ST. PETER’S AS ORIGINALLY DESIGNED BY MICHAEL ANGELO.]

The great Italian cathedral upon which nearly all subsequent churches were modelled was commenced upon the site of the old basilica of St. Peter’s in Rome in the year 1506, upon plans by Bramante, and occupied a century and a half in completion. After Bramante, Giocondo, Julian Sangallo, Raphael, Perruzzi, Antonio di Sangallo, Michael Angelo and Carlo Maderno each worked upon it in turn.

Michael Angelo, who designed the dome, wished to adopt the plan of the Greek cross, that is, with equal arms, as shown in the accompanying plan. The result would have been much more monumental and would have given the dome its due effect within a moderate distance, while now it can only be properly judged from afar, and the high façade terminating the nave is both poor in composition and detrimental to the general conception. The building is essentially Classic in all its details, but differs from the general design of any particular Classical building. The nave is formed by a Corinthian arcade similar to those of ancient Rome, though on a vastly larger scale, supporting a tunnel-vault, which is decorated with sunken panels like those of the ancient Baths.

The dome is supported on a circular drum carried on four immense piers and improves on the Pantheon only in size, while it is surpassed by St. Sophia in scientific construction.

The cathedral is most richly, even gaudily, decorated within, with coloured marbles and mosaics and contains numerous tombs of great magnificence and an altar with twisted columns designed by Bernini. It is the largest church in the world, and yet its proportions are so harmoniously, or inharmoniously designed, that it does not produce a corresponding sense of its vastness upon the beholder. The single order occupying the height of two stories is a feature, the invention, or rather arrangement of which, is attributed to Michael Angelo. In subsequent buildings it was nearly always adopted in preference to the smaller orders marking each floor.

The life of this great artist forms of itself a chapter in the history of architecture. Michael Buonarotti, surnamed Angelo, the most brilliant architect of the sixteenth century, was born of noble parentage in Arezzo in the year 1575. He developed extraordinary talents at an early age, and after outstripping his first instructor, took up his residence in Florence, where he studied anatomy and the human figure until he became the most expert draughtsman of his time. In Rome, where he was summoned by Julius II., he produced several fine works in statuary, but owing to the jealousy of Bramante was forced to quit the city and return to Florence. There he aided the citizens to sustain a siege during a year, by his superior knowledge of fortification, and subsequently went to Venice, where he designed the famous Rialto bridge. At the earnest solicitation of the pope he returned to Rome and commenced the great paintings in the Sistine Chapel, to which work he had been assigned by the counsels of Bramante, who wished to prove his inferiority to his own nephew Raphael. The result of the work, completed in a marvellously short period, however, was so successful that all Rome ran to see it.

After the accession of Paul III. to the Papal see, Michael Angelo was definitely appointed architect of St. Peter's and worked on the building during the remainder of his life, although he returned to Florence several times and there executed the splendid statues which adorn the chapel of the Medicis. In his later days he was assisted by Vignola in his work, but died before its completion at the advanced age of eighty-eight.

Giacomo Barrozio, called Vignola from his birthplace near Bologna, is known for his great works, the chief of which are the Jesuits' church in Rome and the castle of Caprarolla at Viterbo, which he built for the Cardinal Alexander Farnese, and also, especially to architects, for the rules and measurements of Classical orders which he composed from the buildings of Rome with the aid of the manual of Vitruvius.

This work comprises the elements of design used in nearly all the buildings erected during the two following centuries, many of their elevations being simple combinations of different pages of Vignola's book, which to this day is the best guide for Classical proportions and the architects' A B C.

The discriminator between the various architectural styles is fond of drawing a marked distinction between Italian, French, and German Renaissance, and illustrating it by views of the typical Italian palace, with a flat tile roof and low pediments, and the typical French house, with immensely high slate roofs and pretentious dormers. Although the eye of the practised architect can distinguish between the representative work of Sansovino and Philibert Delorme, and between that of Bernini and Claude Perrault, yet such distinctions do not form separate styles, for they are but unimportant differences, caused by local influences.

The subject should be looked upon in a broader sense, for all these subdivisions tend to confuse the student and lead him to forget the sequence of the great historical style of which they form part.

The Jacobean, Queen Anne, and kindred so-called styles in England were merely eccentric streams flowing out of the one main channel, which were scarcely worthy of distinction and certainly not of revival in our times.

In France, under each reign, there was a slight difference of treatment, chiefly in the decoration of interiors, which permits of a classification most convenient to the modern upholsterer, but for our purposes it is sufficient to apply the two divisions—Early and Late Renaissance.

The Chateaux of Blois, Chambord, and Chenonceaux in the Valley of the Loire, the Palaces of Fontainebleau, St. Germain en Laye, the Tuileries and the old Louvre in Paris are splendid examples of the former, and monuments worthy of the great artists, Pierre Lescot, Philibert Delorme, Jean Goujon, and others, who laboured upon them. They are illustrative of the employment of the small orders and ornament in low relief, which characterized the corresponding period in Italy, though they are generally richer and more spirited in design than the Italian buildings, and the soft stone which is so abundant in France permitted more lavish ornament

upon the exteriors.

The skeletons of each design, that is to say, the main architectural lines, stripped of elaborate detail, are much alike and can nearly all be brought back to the ancient method of superposing orders. This is no disparagement on the value of the work, for the plans of many buildings were excellent, and the variety of ornamental design was of a delicacy and imaginative beauty which has rarely been surpassed.

It is questionable, indeed, whether the change which took place in the century of Louis XIV., in the introduction of larger proportions and greater severity of ornament, was so much a gain as it was considered at the time. To this period belong some of the great churches modelled upon or rather suggested by St. Peter's in Rome: St. Paul's in London, rebuilt by Christopher Wren; the Val de Grace, the joint work of Lemercier, Leduc, and Mansart, and the church of the Hotel des Invalides in Paris, also by Mansart, are among the finest of the period and style. The plan of the last-named church is appended as a particularly happy example in general arrangement and symmetrical variety, doing great credit to Mansart, who also built the larger portion of the celebrated Chateau de Versailles.

The publication of Stewart and Revetts' great work upon the antiquities of Athens called general attention in England to the beauty of Greek art, toward the close of the last century, and resulted in the erection of a number of buildings in imitation of Athenian monuments which were utterly inappropriate and unsuited to the English climate.

In France architecture went through two or three fashionable phases, from great extravagance of design under Louis XV. to extreme simplicity under Louis XVI., finally relapsing under Napoleon into the servile copying of entire Classic buildings: a great falling off from the principle of the sixteenth century work, which had always been original in conception although borrowing detail from the antique.

During the early part of this century, architecture sank to the lowest ebb all over the world, probably owing to the disturbing influences of the great Napoleonic wars. Within the last thirty years the spirited writings of a few enthusiasts and the liberal teachings of the French schools have caused a general revival, and better work is being done now than at any time during the century.

[Illustration: PLAN OF CHURCH OF THE HOTEL DES INVALIDES AT PARIS.]

Avaricious commerce and the predominance of the desire for display rather than quiet love of the arts are factors which stand much in the way of genuine progress, but it is not improbable that the spread of refined education will eventually succeed in planting the seeds of this love in the heart of the great masses, and enable architecture to resume its natural and elevating position in their midst.

XII.

CONCLUSION.

At the present stage of modern art we have the principles, broadly speaking, of two great styles of architecture to guide us in the design of the buildings which we may have to erect. These are the Classic and the Gothic; for we may apply the term Classic not merely to the works of the Greeks and Romans, but to their offshoots the Byzantine and Romanesque styles, the one branching Eastward and the other Westward, altered in many respects, but founded on the older systems; and we have seen that the Renaissance was but a revival of the same methods and forms.

In each of these styles the best result has always been attained where the constructional element has been held to be as important as the decorative, where the essential and useful have not been subservient to considerations of ornament or display. In Classic work much has been done that is unworthy, in the senseless repetition of columns and pilasters which support nothing, in decoration which serves only to conceal ill-adjusted architectural lines; and the same is equally true of degenerate Gothic, in which whole walls have been covered with meaningless panels, and massive buttresses built up to receive no strain.

Nevertheless, by following only what is good in the principles of each, and by avoiding the errors which experience has enabled us to perceive, especially those which have engrafted themselves upon us by bigoted custom, we can not only produce fine work but assist in the advance of architecture.

Before deciding upon what style to employ in the composition of an edifice, it is well to first consider thoroughly the programme of what is wanted in its plan, and then the special character with which we desire to invest it both exteriorly and interiorly. It is scarcely necessary to add that both should be intimately connected.

We have seen that the best period of Gothic art was that wherein the whole structure was raised on a theory of weights and strains thrown from vault to pier, and pier to buttress; it is, therefore, absurd, when a building occupies a space between the party-walls of modern street lots, to attempt an interior construction having the appearance of corresponding with buttresses and similar contrivances for which there is no room on the outside.

If, therefore, we choose Gothic for our style, let us follow no false theory, but work on the principles demonstrated in its innumerable examples, in which it may be possible to find room for further development, introducing no feature of construction which has not a full and consistent meaning.

One can scarcely go the lengths to which many venture, in saying that Gothic architecture is suited only to ecclesiastical buildings, for there are many splendid military and civil structures, from the keeps and castles of England and France, to the town-halls of Belgium. But there is this much to be said in their favour, that while the laws of fortification and domestic life have altered entirely since the Middle Ages, on the one hand, those governing the observances of religion have remained unchanged and no manner of building is so essentially religious in its character or better calculated to command the reverence and awe of the devotee, on the other.

In support of this view many will agree in admitting that there is nothing of this religious sentiment expressed in the Corinthian colonnades of St. Peter's, or, in fact, in any of the great number of Renaissance churches which are scattered throughout the cities of Europe, while it never fails to exercise its influence upon anyone entering the great Gothic cathedrals.

The great prevailing thought of Mediæval times was a religious one, and we see it reflected in the minutest details of the lives of the people of that age; it was, consequently, but natural that it should attain its highest expression when they filled their churches with the best that could be produced in architecture, sculpture, and painting. While the Classic orders seem out of place in a temple of Christian worship they are appropriate in civil buildings, and we have no better examples for beauty of proportion. They are the result of the thought and taste of generations of architects and have stood the test of time, for they are as pleasing to-day as in the days of ancient Greece and Rome.

It is their proportion rather than their component parts which we should follow, for a column, unless needed as a support, is a questionable decoration, and pilasters or engaged columns are only desirable where additional thickness of wall is required, used as the Gothic architect would have used buttresses, and never as mere ornaments, which are at once a fraudulent delusion and a retrogression in the progress of architecture.

A multiplicity of columns and entablatures does not make perfect architecture, but great leading lines, good proportion, clear detail, and appropriate ornament.

The guiding rule is to do nothing which has not intrinsic merit. It is better to have an absolutely plain wall than one covered with poor decoration; far better to have no cornice at all than a galvanized iron one, painted to look like stone.

The true definition of architecture is "ornamental construction." It is not a utilitarian science, because if so there would be no _raison d'être_ for beauty of design, for mere shelter and commodious arrangement could as well be provided by the engineer as by the architect. The art of the architect lies in the composition of buildings at once suited to their purpose and beautiful to the eye; and as such his art is one that can progress, not through a series of changing fashions which grow wearisome before they have lasted a decade, but step by step, according to the example of the great periods of the past.

This example teaches us never to copy slavishly, but to imitate old examples only so far as they may suit modern needs, in principle rather than in detail, and to eschew the reproduction of defects, however picturesque, so that architecture may be a living art instead of the mummified representation of archæological researches.

In pursuing the study of so vast and splendid an art we should do so with some feeling of reverence for its dignity, not looking upon it as a mere money-making trade, for the greatest architects the world has known have been satisfied in being only worshippers at a great shrine. Reverence is a sentiment slightly regarded in an age when delicacy of feeling in such matters is often held up as a butt for the jests and derision of the vulgar, and the dignity of the art has little foothold when it has become a custom for the vendor

of cheap furniture to style his shop an “Art Repository,” and the founder of cast-iron abortions to call his factory “The Art Metal Works.”

Nevertheless all of our work must reflect something of our inner thoughts, and if we do not place them upon a high plane it is not possible for their reflection to contain what is noble and true. We cannot become artists in the true sense of the word without loving and reverencing the beauty and principles which have made the art so great a one.

It is the custom among certain people to sneer at sentiment, and call for practical art; but the most practical art is essentially the product of thoughtful sentiments.

As an illustration, let us compare the Laocoön, of sculpture; the Halls of Karnak, of architecture; the Dead March, of music; the “Descent from the Cross,” of painting, with the “Dancing Faun,” the arabesques of the Renaissance, the waltzes of Chopin, and the gay feasts depicted by Paolo Veronese, and the contrast shows us that each branch of an universal art expresses the opposite feelings of gravity or tragedy, of joy or comedy, each in its separate manner.

In designing, questions arise every moment which can only be decided by an innate sentiment of what is good and appropriate. There are no fixed laws governing the height of a spire or the projection of a moulding; they are matters which depend upon correct feeling, or, in other words, upon educated taste.

If it were not so, art would become a mechanical science, and could no longer be called by that name. Emotion has no place in mechanics, but it has great influence in the arts. We know the Greeks were an emotional race, and it is said that Michael Angelo wept before a beautiful statue or painting; and the works of the people and of the individual were proportionate to the depth of their feelings, and have perhaps never been excelled.

Let us, therefore, commence this study—for the omega of this book is but the alpha of architecture—despising none of its delicate subtleties, and endeavour to grasp its principles, in the hope of doing our share in its further advance, laying aside the petty gratification of our vanity in a genuine affection for our art.

THE END

TRANSCRIBER’S NOTE

Illustrations in this eBook have been positioned between paragraphs and outside quotations. In versions of this eBook that support hyperlinks, the page references in the List of Illustrations lead to the corresponding illustrations.

The index was not checked for proper alphabetization or correct page references.

Obvious typographical errors and punctuation errors have been corrected after careful comparison with other occurrences within the text and consultation of external sources.

Some hyphens in words have been silently removed, some added, when a predominant preference was found in the original book.

Except for those changes noted below, all misspellings in the text, and inconsistent or archaic usage, have been retained.

Page 21: “tenemos” replaced by “temenos”. 31: “Chilambaram” replaced by “Chidambaram”. 32: “baldaquins” replaced by “baldachins”. 40: “ababaster” replaced by “alabaster”. 111: “Adb-el-Rhaman” replaced by “Abd-el-Rhaman”. 119: “continuons” replaced by “continuous”. 126: “weer” replaced by “were”.

SKIN DISEASES AND THEIR CURE

There are still persons who believe that every disease of the skin can be successfully treated with a salve, a lotion or a powder. This belief and the advertisements of nostrums for the treatment of skin disease are a reflection of the actual knowledge of such conditions held even by the medical profession a quarter of a century ago.

Today the methods of treatment of skin diseases include practically every form of apparatus, every method of medical administration known to medical science. This advance is a reflection of the application of knowledge in physics, chemistry, biology and bacteriology to medicine, and of a more thorough comprehension of the fact that the skin is not merely a protective covering for the body but an organ whose condition reflects that of the other tissues and influences them definitely.

Perhaps the greatest advance has been the X-ray and the knowledge that application of its rays would affect not only tumors, whose cause is unknown, but also inflammations and degenerations of the skin produced by parasitic organisms. Not only the rays of the X-ray tube, but also those of radium, of the sun and of the ultraviolet lamps are known to have definite effects on the skin. Radium is used for destroying cancer of the skin, masses of veins, birth marks, moles and similar unsightly excresences. As Dr. Fred Wise indicated at a recent meeting of specialists in diseases of the skin, the physician is no longer limited to any single form of treatment, but may attack such growths with any of the destructive rays that have been mentioned; he may freeze them with carbon dioxid snow; he may remove them surgically with the knife; he may dry them by passing an electric current through them, or cut them with a needle whose cutting power depends on vibrations produced by electric waves. In attacking certain parasitic diseases of the skin, the specialist reaches them through the blood, injecting combinations of dyes and metallic elements or specific drugs which produce the immediate death of the parasitic organisms when they come in contact with them.

There still remain infections and diseases of the skin which are not easily amenable to treatment. Pemphigus, in which there are tremendous wheals, blisters and similar eruptions, is not known to yield easily to any form of treatment, although it may be benefited on occasion by the use of drugs such as arsenic and quinine. Generalized changes of the nature of the skin resulting from disturbances of the nervous system and of the glands sometimes resist every form of medical attack. Research in the field of skin diseases is one of the most promising opportunities for investigation to the medical man with research instincts.

COSMETICS

Since investigation has been undertaken by physicians and chemists there is less and less likelihood of the sale or purchase of cosmetic preparations, including face creams, powders and lotions, containing poisonous ingredients, although at one time such metallic poisons as lead, bismuth, or arsenic could be found as ingredients of such beautifiers. Nowadays, the difficulty seems to be that there are a multiplicity of preparations which have no real warrant, since they differ only in unessential qualities from each other. There are, for example, dozens of creams sold for application to the skin with claims that they nourish the skin, when, as a matter of fact, there is no such thing as a skin food. All of these creams essentially are cold creams, modified by varying amounts of perfumes or other thinning or thickening factors.

These statements do not apply, however, to the creams that are used as depilatories. Most of the widely advertised ointments for this purpose have as their basis a salt of the metal barium. Application of the ointment removes the hair, but does not affect the growing end within the skin. In most instances the new growth of hair is thicker and coarser and darker than the original growth removed by the depilatory. In some instances, superfluous hair is removed by the application of the X-ray. It has been found, however, that X-ray machines seldom kill the living cell from which the hair grows, unless it is applied in dosage so strong as to produce definite changes in the skin itself.

Specialists in diseases of the skin are being called on to treat thickening of the skin, or so-called precancerous keratosis, resulting from the use of the X-ray for the removal of hair by inexperienced persons. Those who give special attention to these problems are agreed that the one certain method of removal of superfluous hair is the use of the electric needle. It must be understood, however, that it is possible to remove only a few hairs at a single treatment, and that the method requires great expertness in its application.

SKIN DISEASE QUACKERY

Faith springs eternal in the human breast and credulity is not the property of any single class. One finds our best educated citizens just as easily susceptible to false and fraudulent claims as the most ignorant. Indeed, in many instances, particularly in relation to medical science, a little knowledge is a dangerous thing, since its possessor is likely to be impressed with his own ability to make suitable judgments.

Of particular interest in this connection are the many cosmetics offered to women who seek eternally for artificial beauty. According to an investigation recently made, the American public paid, in 1921, $150,000,000 for perfumery and cosmetics. There were purchased 240,000,000 packages of talcum and face powders and 18,000,000 packages of rouge.

Students of diseases of the skin constantly emphasize the difficulty of determining the nature of any eruption. Red spots and slight inflammations may be due to disturbances of digestion, to special sensitivity to various food substances, to eczema, to any one of a half-dozen infections, and possibly to tuberculosis or to syphilis.

Since the tendency of some minor conditions is to recover without treatment, persons are likely to indulge in self-treatment and thus to neglect the more serious complaints to a time when a cure is far more difficult than when they are seen early. Cancer of the skin appears in its beginning as a small and rather unnoticeable spot; if seen early, it is easily controlled, but if stimulated by the use of all sorts of caustic acids or pastes it may become so serious as to produce death.

The craze for beauty has also resulted in the tremendous rise of the beauty parlor. It is easy to remember the time when our largest cities could boast of but five or ten hair-dressing establishments. Today in the Boroughs of Manhattan and the Bronx alone there are 1,177 hair-dressing establishments. Here women come not only for massages and permanent waves but also, frequently, for the treatment of diseases of the skin and for the removal of superfluous hair, moles, warts, or tumors.

These beauty parlors are the outgrowth, in many instances, of manufacturing establishments for the sale of cosmetics. Here cold cream masquerades under twenty different names and women purchase for considerable sums preparations which cannot possibly do the things that are claimed for them.

One finds “rose leaf cleansers,” “skin fresheners,” “face moulding creams,” “balsam tissue astringents,” “skin fatteners” and “skin thinners,” cleansing creams and vanishing creams, regardless of the fact that specialists in the disease of the skin have stated again and again that all that any cream can accomplish is simply to make the skin more pliable.

MAGIC OF PLASTIC SURGERY REPLACES SCARRING KNIFE

During the World War the mutilating injuries suffered by many of the men were assuaged through the development of new features in surgical technique.

Whereas formerly it was considered sufficient merely to sew up a wound, to amputate a shattered limb or to save life regardless of appearance, surgeons then began to consider operations with a view to the most presentable appearance possible after repair.

The technique itself is difficult but the war yielded a few masters in the medical service of each of the warring nations.

Stitching and Filling In.--In addition to making wounds more sightly by fine stitching, methods were evolved for filling in defects by transplanting tissues from points elsewhere in the body.

For instance, a wound under the eye was repaired by moving some of the loose tissue from the forehead or the cheek. This was left attached to its original blood supply until new vessels had come in and then the original attachment or pedicle was removed.

In one instance tissue taken from the upper part of the chest filled in the side of the face. Here mutilations were made sightly and at least a tolerable existence given to men whose lives otherwise might have been an agony of sensitiveness.

Transplanting Muscles.--In one case a man whose arm was lost at the shoulder had not even enough of a stump to attach an artificial limb.

By transplanting muscles and tendons from neighboring parts, surgeons were able to make a stump that served well for the attachment of an artificial limb with which the man was able to earn a livelihood.

The economic aspects of the situation are, of course, even more important than those relating wholly to the patient’s appearance.

BUTTON IN SAVAGE'S SKULL FIRST PLASTIC SURGERY

Even the ancient savages used to make holes in the skull to let out the demons which they believed were responsible for disease.

Instances are recorded in which they also repaired such holes by the insertion of buttons of bone previously removed. In attempting to repair the ravages of disease, surgeons today sometimes fill in defects with substances of various kinds. At the recent meeting of the American Academy of Ophthalmology and Otolaryngology in Colorado Springs, one entire session was devoted to the newest points in this fine surgical art.

Removing an Eye.--When an eye must be removed because of inflammation or disease--and this sometimes done promptly to save the sight of the remaining eye--the cavity that is left may be extremely unsightly. Dr. Harold Gifford of Omaha told of various operations that are done to secure a good appearance. When an artificial eye is to be worn the socket must be made suitable to hold it. Sometimes paraffin is employed to develop a proper cavity, although most physicians fear this substance because its injection may produce irritations and overgrowth more unsightly and certainly more dangerous than the condition the paraffin was planned to correct.

Dr. Harry L. Pollock of Chicago told of several instances in which cancerous growths had followed the injection of paraffin by beauty doctors to relieve wrinkles or the sunken bridge of a nose injured by a blow. The appearance seemed beautiful immediately after the injection of the paraffin, but soon the irritation set in. Then the face became a mass of humpy tumors which had to be removed by surgery and which left serious scars.

Celluloid was tried for a while, but it also was discarded because the results were unsatisfactory.

Use of Ivory.--The newest and for the present apparently the best substance to use for repairing defects is ivory--either natural or synthetic. Dr. Pollock pointed out that this substance is more nearly like bone in its composition than any other substance known. Both bone and cartilage are used also, but Dr. Pollock's experience inclined him to favor ivory over either.

Obviously this work is not for the amateur, but for the experienced worker. The so-called advertising beauty doctors seldom attempt it because the conditions under which most of them work are not conducive to successful surgery. They choose rather to delude their patients with promises of rapid and easy relief that are never fulfilled.

BEWARE OF BEAUTY DOCTOR WHO OFFERS GUARANTEES

Recently there came to medical attention the case of a woman who had been the victim of the search for beauty through surgery. She was the wife of a prominent merchant in a foreign country.

When she was eight years old she was operated on for the relief of tuberculous glands in her neck. She grew up, married successfully and gave birth to a handsome son.

But in the meanwhile her life, comfortable enough otherwise, was disturbed because the scars of her operation showed when she wore evening dress.

Tours Europe.--Finally she set out upon a tour of Europe. She arrived in Paris, where she consulted several eminent surgeons, all of whom advised against operation.

Then she heard, through the press notices of the theatrical papers, that American beauty doctors were doing marvels in such cases. In this country she reached finally a beauty doctor widely heralded through paid publicity secured by publicity agents.

She was intrigued and coaxed into an operation by cleverly written pamphlets detailing the success accomplished on worn-out actresses and movie stars. She decided at last not only on an operation on her neck but also on face lifting, face peeling, wrinkle removing and similar procedures.

No Anesthetic.--These operations were carried on in the office of the beauty doctor, without an anesthetic and rather crudely in the arrangements for cleanliness. A qualified surgeon works in a qualified and reputable hospital. Advertising beauty doctors are not admitted to reputable hospitals.

The woman finally left the ministrations of the beauty doctor. She had unsightly scars, worse even than those for which she had originally consulted him.

Her skin, irritated by the caustic chemicals used to peel it, continued to give off fine scales. The lifting operations, the loss of blood, the weeks necessary for recovery in a low-grade hospital in which the beauty doctor finally placed her, left the woman nervous, melancholy--mentally a wreck.

A reputable surgeon makes no guarantees of success in plastic surgery. The disreputable beauty doctor relies on the shame of the patient and her fear of ridicule to protect him when his surgery goes wrong, as it so often does.

EITHER HAIR OR HEALTH ENDANGERED BY DYES

Ever since the first woman looked into a polished surface and decided that her appearance would be greatly benefited by certain sophisticated modifications, the feminine sex has been tampering with its natural beauty.

Among the first of the features to receive attention has been the hair, long known as “woman’s crowning glory,” and now merely an added source of income to the tonsorial artist. The first hair dyes were made from vegetable substances. Then came metallic, chemical compounds, and more recently the synthetic dyes largely derived from coal tar products.

Among the vegetable dyes, henna is the best known example, but indigo wood extracts, sage and camomile have also been popular. Hair dyed with henna is light red, but one hour will make brown hair extremely red and give to white and blond hair a quite peculiar orange color, extremely artificial and unattractive.

The wood extracts and camomile produce all sorts of peculiar colors. They are reasonably safe, but suffer from the disadvantage that the dyes are difficult to prepare and the result not especially permanent. Most of these dyes do not penetrate the hair shaft, but merely coat it so that their repeated use tends to make the hair quite brittle.

Metallic dyes include combinations of lead, silver, copper, tin, and other metals. All metallic hair dyes, according to Dr. McCafferty, who has written extensively on the subject, must be considered as potentially dangerous when used for any length of time. The material may be absorbed into the body and the person so saturated with metallic poison that he develops serious symptoms.

Most of the dye substances offered on the market and advertised in publications are combinations of henna with metallic substances. The dye action depends principally on the pyrogallol and on the metal, with just enough henna present to permit the manufacturer to use the name “henna dye.”

The most common dye used today is the synthetic drug known as paraphenylene-diamine. Many persons are especially sensitive to this drug and develop severe eruptions following its use. In certain instances, eruptions on the back of the neck and on the arms follow the wearing of fur dyed with this substance. In Germany, the dye must always be marked with a “poison” label and most European countries have followed that example.

In this country, legislatures are only beginning to consider legislation of a similar character.

If a person is sensitive to paraphenylene-diamine, his scalp and face will begin to tingle and itch after its application, and this will be followed, in from 10 to 12 hours, by a swelling and blistering of the skin. The eyelids also may swell to such an extent that the person is unable to see.

Most of the cosmetic establishments use this dye for their work. The treatment given by most physicians consists in wet dressings of boric acid solutions and in small doses of X-ray to the region concerned. Following the subsidence of the preliminary symptoms, soothing creams are applied to the tissues. Dr. McCafferty points out that every substance used as a dye remover is a dangerous poison, which, if it does not injure the person using it, at least makes the hair extremely brittle. It is his belief that dye removers should be legislated out of the beauty shops.

SKIN ERUPTIONS LAID TO POISON IN DYED FUR

Every winter physicians who specialize in diseases of the skin are asked to see cases of eruptions around the throat and wrists resulting from poisoning with incompletely or improperly dyed furs.

The principal symptoms are blotches and swelling with itching and burning, so severe in some cases that the person cannot sleep at night.

Rabbit Becomes Beaver.--The trouble is found in most instances to result from rabbit that is dyed to imitate beaver, although all sorts of furs may be involved.

In these cases the poisonous substance is usually a compound of paraphenylene-diamine, the same poisonous substance that causes irritation of the scalps of those who attempt to dye gray hair black.

Many foreign nations have introduced laws to prevent the use of this substance in hair dyes and to regulate the fur-dying industry. Similar laws have been passed in some of our states, but there is as yet no nation-wide regulation regarding the use of this substance.

Investigate Cases.--Not all persons are equally sensitive to this dye. Some may wear furs dyed in this manner without symptoms, but those who are sensitive develop severe reactions.

Several investigative committees are attempting to secure a record of all the cases of this type that occur.

If anyone knows of such an instance, the report may be sent to the Committee on Dye Poisoning of the American Medical Association, 535 N. Dearborn Street, Chicago.

MOST MOLES HARMLESS, BUT WATCH BLACK ONES!

It has been estimated that there are five moles on an average on every person in the city of Chicago.

If all of these were to be removed, it would require more than 15,000,000 separate surgical operations.

The history of moles would be an extremely interesting topic, since they were long regarded as of great significance--sometimes considered the work of evil spirits; sometimes thought to be due to the influence of the moon or the stars, and occasionally thought to be of importance in determining configuration of the body.

Superstition.--Charts of moles were prepared so that one might tell by observation of those that were visible where to expect others that might be invisible. Needless to say, all of this was superstitious and without the slightest scientific importance.

As long as a mole does not disfigure the appearance, it is best disregarded, unless under certain circumstances it becomes irritated and subject to the unusually rapid growth that is characteristic of cancer.

If a mole is extremely brown or black, it has in it an unusual amount of a pigment called melanin, which is responsible for giving the color to the hair, the eyes, and the deeper layers of skin.

Somehow, the presence of this substance seems to be associated with dangerous possibilities, so that a severe injury or irritation of a deeply pigmented mole may cause it to suddenly develop rapid growth.

Watch Black Ones.--The most dangerous moles are those that are jet black. If these are situated where they are constantly rubbed or irritated by collars, garters, shoes or other garments, they should be most carefully watched.

The danger signs have been listed by some doctors as: (1) a gradual increase in the size of the mole; (2) deepening or spreading of the color; (3) ulceration or infection; (4) pain or soreness in the mole.

If any of these symptoms appear, the person concerned should promptly consult a physician. If they do not appear, the mole should be left alone and not teased by irritation, rubbing, picking, scratching, or half-hearted attempts at its removal.

FLOWERS CARRY POISON

Some persons are especially sensitive to contact with toxic substances derived from plants. The poison ivy, oak, and sumac may cause severe eruptions of the skin in persons susceptible.

When mah-jong first became popular, many persons had eruptions of the fingers and of the skin of the face from contact with the lacquer on the mah-jong boxes, due to a special sensitivity that they possessed to a poison in the lacquer which it was discovered had been made by utilizing the juices of certain Japanese plants.

Handling of Bulbs.--Now a British physician has discovered eruptions on the hands of some persons from the handling of flower bulbs, and has given the name “lily rash” to this type of disturbance.

It followed the cutting of the stems of the flowers, chiefly the narcissus, and from handling bulbs of the hyacinth, daffodil, narcissus and tulip.

An investigation was made in several establishments devoted to the sale of bulbs, and a small proportion of packers and sorters of bulbs were found to be suffering from an eruption extending under the nail, where splitting of the skin caused considerable pain.

The longer the nails were worn, the more severe was the condition. Moreover, the inflammation of the skin, which occurred after a few days’ work in handling the bulbs, was progressive until the worker began to use gloves.

All the workers were inclined to blame the tulip bulbs. Some of the observers thought that the eruptions were due to friction from the rough sides of the bulbs, and were ready to place the responsibility on the hyacinth, narcissus and daffodil.

An investigation showed, however, that the tulip bulb is surrounded with a single layered covering which spreads easily and that it holds a somewhat acrid juice. When this juice was applied to the skin underneath the finger nail it promptly produced irritation, even without any breaking of the skin due to rubbing.

The obvious suggestion is that persons who are likely to handle tulip bulbs in any considerable numbers ought to wear protective gloves.

SNOW OR COLD WATER BEST IN TREATING FROSTBITE

When a portion of the body not properly protected is exposed to intense or extreme cold, the tissues become affected. If the cold is sufficiently intense and the exposure is sufficiently prolonged, the part becomes frozen.

When the circulation of the blood is sluggish, as in the very young, the old and the sick, suffering from cold is likely to be more severe.

In the same way those parts of the body in which the circulation is least active, and which are least protected by clothing, as the ears, the hands and the feet, are most likely to be affected.

Blisters May Form.--In mild frostbite there usually is merely tingling and slight pain. If the cold is more intense and the exposure more prolonged, blisters form with serum or blood inside of them.

If the freezing is still further prolonged, the entire part becomes gangrenous because of the congealing of the blood within. Then the tissues appear bluish, shrunken or wrinkled and are without sensation or the power of motion.

The best treatment for frostbite at first is friction with snow or cold water in a cold room, the changes to a warmer atmosphere being brought about gradually.

After the friction the feet or hands should be swathed in cotton-wool held in position by loose bandages. If there are blisters or any discolorations of the tissues, a physician should be seen promptly.

On the speed with which proper treatment is given may depend the saving or loss of a limb.

Chilblains.--Chilblains, which also are associated with a sluggish circulation, usually produce burning heat with itching and redness, and are likely to follow prolonged exposure to cold combined with dampness.

They may be prevented by wearing warm, loose woolen stockings and warm shoes. The feet should be bathed in warm water daily, and after the bath should be rubbed briskly, quickly dried and dusted with a plain dusting powder.

WASH YOUR NECK WELL TO WARD OFF BOILS

Those frequent and unwelcome visitors--boils--always are due to skin infection. The greatest preventive is constant cleanliness of the skin, particularly of the back of the neck or other parts commonly affected.

In men the back of the neck is the part most commonly affected, usually because of the constant rubbing of the collar on the hair of the lower part of the back of the head.

May Be Serious Signal.--Certain diseases, such as diabetes, seem to predispose the person to infection with boils, and the constant recurrence of boils should be the signal for a visit to the doctor.

The person who succumbs readily to skin infections lacks bodily resistance. This resistance of the skin is associated with the presence in the blood of substances that will overcome bacteria.

The constantly recurring warning to keep the body in the best physical state by proper diet, proper cleaning and prompt attention to infections in the ear, nose and throat is here of the greatest importance.

When a boil occurs the parts around it are usually shaved, since the infection spreads from one hair follicle to another. All sorts of antiseptics may be applied and fail to control the boil unless the tissues of the body wall it off and cause it to “come to a head.” Heat aids this process by bringing a good supply of blood to the part affected.

Surgical Attention.--A boil should not be opened by some friend who happens to think himself a surgeon merely because he does not faint at the sight of blood. Improper opening or drainage of a boil may be exceedingly serious by spreading the infection to the body generally.

The surgeon will open the boil with proper precautions against extension of the infection and will see to it that the boil drains properly.

The germs that cause boils are small round organisms, commonly seen in clusters when stained and studied with a microscope. Some physicians build up the resistance of the chronic sufferer from boils by preparing a vaccine from the patient’s own bacteria.

PSORIASIS ONE OF THE MOST ANNOYING SKIN FAULTS

Of all of the diseases of the skin that affect the human body, one of the most annoying is called psoriasis. In this disease, the skin becomes inflamed and there develop round patches which are red at their base and which are covered by dry, white scales.

These patches slowly enlarge, never developing into blisters, but continuing to give off scales. The disease usually begins on the back of the arms and the front of the legs, just below the elbows and knees, and may involve also the scalp and the lower part of the back, but seldom appears on the face.

The disease continues for months and years, sometimes better, sometimes worse. The patient is seldom disturbed in general by the condition, except by its annoying appearance and the development of the scales.

A disease of this type has been treated by all of the methods known to medical science, and the fact that so many methods have been suggested is an indication that none has proved especially satisfactory. Any good specialist in diseases of the skin is able to clear up the lesions temporarily by the use of proper drugs, and usually recommends a change in the diet involving reduction of protein substances and of meat.

In a recent consideration by the leading specialists in diseases of the skin of Great Britain, it was pointed out that the best results today are secured by local treatment, with attention to the general hygiene of the body, and that the value of the various special forms of treatment mentioned in medical literature have not yet been established.

A person who suffers with this disease will do well to select a specialist in diseases of the skin and to follow the general routine laid down.

The chronic character of the disease and its apparent incurability cause persons affected to travel from one specialist to another, and to consult all sorts of fads and quackery in their search for relief. Until some specific curative method is discovered, they will in this way merely waste funds which might better be conserved for useful treatment.

“CAULIFLOWER EARS”

Among the first of the beauty operations to attract public attention was the correction of what the pugilists call a cauliflower or “tin” ear. This term is applied to the result of a powerful force sharply administered to the appendages on the sides of the prizefighter’s

visage. Immediately thereafter the blood vessels beneath the skin burst and the blood pours out into the membranes which cover the cartilage or gristle of the ear. The blood distends the tissues of the ear to the extent of the blood pressure and until the blood coagulates. The swelling thus formed may gradually be absorbed and the ear return to its normal state, but in many instances tissue forms out of the mass and when this contracts the ear is distorted into the cauliflower shape. Dr. Samuel Iglaur has pointed out that it is the left ear that is usually of the cauliflower variety, since this ear receives most of the wallops from the right fist of the opponent. Cauliflower ears are also seen frequently in wrestlers, and before the development of headgear were not unusual in football players.

After the pugilist develops affluence and is ready to retire to the stage or the screen he is usually ready to submit himself to remodeling and decorative surgical art. If he develops this vanity previous to his retirement, the revamped ear is likely to become a special target for the opposition the moment he steps into the ring.

FLOPPING EAR NEEDS CAREFUL OPERATION

Next to the cauliflower ear, no other deformity of this particular organ is so frequently the subject of correction as the outstanding ear. This is usually a congenital development and one which is likely to give much distress, particularly to a girl who is otherwise handsome. Many persons have thought that outstanding ears could be corrected merely by sewing the ear to the skin back of it. However, in practice it has been found that the skin will stretch promptly and the ear sag into a new and perhaps more undesirable position. The operation is, therefore, most intricate, involving actual transplantation of part of the cartilage of the ear to the bony covering of the skull behind the ear.

Such decorative surgery is comparatively recent in medicine. Perhaps the first operation for correction of outstanding ears was devised in 1861. Nowadays, with the increasing prosperity, publicity and vanity, such operations have become fairly frequent.

The reliable cosmetic and plastic surgeon is usually associated with a hospital that has been classified by the American Medical Association and the American College of Surgeons as a reputable institution. His work is done under the best surgical conditions, with the assistance of well trained nurses and with all of the cleanliness that is absolutely necessary if surgery of any type is to be successful.

It has been said that the persons who seek cosmetic surgery are likely to be dissatisfied with any result short of perfection, and that they submit to operation after operation, falling more and more into the net of the unprincipled surgeon, if they happen to have begun their quest for beauty with an advertising quack.

The great campaign of education about quackery carried on for many years has resulted in the development of new methods of advertising by the unprincipled surgical impresario. He is far too shrewd to indulge himself in purchased advertising space in newspapers or periodicals. He, therefore, secures a publicity agent who is as likely as not to be a reporter on some local newspaper, willing to eke out a narrow income by playing both ends against the middle. This enterprising journalist takes payment from the beauty surgeon for securing space for him in the daily press, and submits to his newspaper news items regarding weird operations performed by the beauty surgeon on actors, pugilists and other notorious persons. The result is to bring a flood of less notable but equally simple kitchen mechanics, stenographers, elderly housewives and other shallow-minded searchers for beauty into the net.

RUBBER “REDUCERS” ARE FOES OF COMFORT BUT NOT OF FAT

In the craze for reduction which agitated most of the women of the United States during the past few years, many of them undertook all sorts of exercises, diets and the use of all kinds of apparatus to remove what they considered superfluous weight.

Among the most widely advertised articles were corsets and brassières, made of pure gum rubber, which were supposed to be worn next to the skin. It was perhaps the notion of those who promoted these devices that they would squeeze the flesh into a more solid form, perhaps causing the body to eliminate the superfluous matter from inside.

There is not, of course, the slightest scientific reason to believe that such apparatus could do anything of the kind. The chief effect of wearing rubber garments next to the skin is that they prevent perspiration from evaporating. Since the perspiration is rubbed into the skin, it is likely to produce irritation.

Some persons have severe irritation of the skin from contact with the rubber itself. The rubber garment does not increase the sweat, but simply causes it to remain on the surface. Certainly it does not cleanse the skin, but rather tends to make it accumulate deposits of waste products.

The sweat regulates the temperature of the body by evaporation from the surface. It also keeps the skin soft by keeping it moist and well lubricated. Rubber garments prevent evaporation of the sweat, which produces laceration of the skin.

Certainly they cannot in any way aid the lubrication of the skin, since retention of salts and other substances is likely to make it drier and to cover it with crusts.

BE CAREFUL IN USE OF LAXATIVE GUMS

It is safe to say that more proprietary medicines of a laxative character are sold in this country than in any other.

The vogue of chewing gum is also particularly an American institution. It is not surprising therefore that a manufacturer has begun the sale and distribution of chewing gum into which is incorporated a quantity of a well known laxative drug.

Caution in Usage.--While chewing gums thus medicated may be safe as laxatives, there are excellent reasons why this drug should not be sold indiscriminately. Samples were distributed in the streets of some cities, until boards of health prevented such distribution because the samples fell into the hands of children and there were serious results.

Besides, some persons are especially sensitive, and react with severe inflammation of the skin when they take even a small dose of this remedy.

The second use to which chewing gum has been put has been to incorporate drugs alleged to have special properties for reducing obesity.

Thyroid Extract.--Anti-fat chewing gums contain thyroid extract, which is dangerous; drugs that irritate the stomach and disturb the appetite, which are also dangerous, and drugs which have no power whatever, which is foolish. The United States government has recently issued fraud orders against several chewing gums of this character.

The person who uses the gum is told that in addition to taking the remedy she should walk five miles a day, go through certain exercises, and cut down the diet. These practices will bring about a reduction in weight just as well without chewing the gum.

OVEREATING HARMFUL AFTER MIDDLE LIFE

Most of the illnesses that afflict the man beyond middle age are due to the fact that he does not realize his intestinal limitations.

The most pernicious misdemeanor after middle life is overeating. The person who works out-of-doors is, of course, able to dispose of more and heavier food than does the brain-worker.

The brain-worker who tries to eat meat three times a day will find himself, in most instances, in better condition if he eats meat only once each day, but in this condition quantity of food is more important than its nature.

Cooked Foods.--The human being gradually has been adapting himself to more and more refined and thoroughly cooked foods. Nevertheless, it is not desirable for him suddenly to change to foods that are coarse and indigestible.

These perhaps will aid elimination, but at the same time they will irritate the delicate lining of the intestines and permit the more easy entrance of bacteria into the body.

Too much starch, protein or fat is harmful because it will not be digested fully and will encourage the growth of bacteria in the intestines. As one becomes older his tolerance for sugars becomes less, and if he eats too much sweet or starchy foods, he is likely to develop disorders of sugar elimination.

Insurance Records.--All health authorities are agreed that the greatest danger for the man beyond middle age is overeating. The records of great insurance companies show that the life expectancy of the man slightly underweight at this age is greater by far than that of the man who is overweight.

As the old farmer expressed the matter, pigs would live longer if they did not make hogs of themselves.

ON ART AND ARTISTS

ON ART AND ARTISTS

I

THE SOCIAL MISSION OF ART

There exists a school of æstheticism which laughs contemptuously at the mere sight of this superscription. Art having a mission! What utter nonsense. A person must be a rank Philistine to connect with the idea of art the conception of a non-artistic mission, be it social or otherwise. Has a work of art any other mission than to give pleasure by beauty? It strives to attain no goal that lies outside of itself. It is its own object, and whoever assigns to it another, sins against the sanctity of art.

This is, in short, the theory of art for art's sake: _l'art pour l'art_. I deem this theory false and a hallmark of crass ignorance, for psychology and the history of civilisation and art, the history of all arts, prove irrefutably the vanity and worthlessness of the concept that denies to art any other task and mission than that of being beautiful.

Certainly art is, in the main, a purely subjective activity, in which the artist wishes solely to satisfy himself, without thinking of any person or thing external to himself. The psychological roots of all artistic creation are, in fact, an exceptional sensitiveness and feeling on the part of the artist. We know that every moderately strong impression which man—and, moreover, not only man, but also every living creature, however low in the scale—receives from the external world, excites in him processes, which, in the case of man and the higher animals, attain consciousness as emotion or passion. The emotion imperiously urges in towards liberation through movements, that is to say, muscular activity, which, in many cases, is accompanied by glandular activity, _e.g._ tears, secretion of saliva, perspiration, etc. To men of the average type the usual forms of manifesting their emotion suffice. If they have wept in sorrow, laughed for joy, cursed or clenched their fist in anger, they are pacified. Their emotion has spent itself and become exhausted, and their physical life once more flows in its accustomed channels.

However, if, instead of the average man, we have before us a creature of exceptional sensitiveness and emotionality, the psychical processes assume another shape. This creature feels all phenomena more acutely; they arouse in him more violent passions; his emotions are deeper and more lasting. Their normal forms of expression do not suffice to lull them. They take possession of his soul, organise themselves, show a tendency to become compelling ideas, and oppress it with psycho-motorial incitements or impulses until it has freed itself from them by acts which stand in proper ratio to the number or violence of the emotions. A being whose excessive emotionality is of an angry, malicious nature attains relief only through deeds of destruction. Such is the case with most sub-species of born criminals. Should the exceptionally strong emotions not be of a destructive nature, they find their outlet otherwise by artistic creations, which, therefore, are a liberation and solution of emotion that has become overmastering.

But this simple, as it were, normal case, in which the work of art actually fulfils a purely subjective mission, and aims at no other object than to relieve the artist's nervous system and to unburden his mind of a compelling idea—this case is actually met with only in the earliest ages of mankind. Art for art's sake—the art which is practised purely for the relief and satisfaction of the artist—is that of the cave-man of the quaternary period. The artist who adorned the walls of the Caves of Mouthe[1] with figures of animals; who scratched the famous mammoth on the tusk of La Madeleine in the Dordogne; the draughtsman of Bruniquel, of Schaffhausen; the author of the rock-pictures in Sweden, probably did not trouble himself as to whether he was producing any effect on others. In all likelihood he did not work for society. His psychology is disclosed to us by the subjects he treated. He was an enthusiastic hunter, endowed with a particularly lively intuition and manual dexterity. On the days when he could not go hunting, either because bad weather prevented him doing so, or external compulsion—perhaps an accident met with in the chase—confined him to his cave, he thought longingly of his favourite occupation. The beasts that composed his usual booty lived in his imagination. His grotto was peopled with the monsters of the forest and plain of primitive times. He saw the mammoth with its stiff mane, the grisly cave-bear, the aurochs and giant-elk, the shaggy, thick-set horse of Solutré; he pursued, fought, slew them. He felt all the keen joys of these mighty deeds, and became so strongly excited that he could not refrain from realising the lively pictures of his fancy, by drawing them on bones, tusks, or rocks, or carving them on stags' horns and elephants' teeth. It would not gainsay this psychology of primitive human art, if the artists in remote ages (as the latest pre-historic investigations seem to attest) connected superstitious ideas with the imitation of their animals of the chase, perhaps believed by such means they cast a spell on the animals portrayed, and facilitated their capture. A superstition like this would, in its turn, become a source of fresh emotions which also seek outward expression.

Besides the hunter there was also the warrior, who liked to portray his conquered enemies, and the sensualist, who sought delight in carving female busts, the types of which, to our taste, seem very ugly, but may have appeared alluring to him.

These savage forefathers who adorned the caves of the early stone age with works of art not invariably crude; who woke the echo of the forest valleys with plaintive or yearning melodies; who excited themselves by sensuous dances in the moonlight nights of

spring; who formed, in symbolic and allegorical songs, their mystic impressions of the great phenomena of the weather and sky;—these savage forefathers were the first, but at the same time last, purely subjective artists, the only real believers in the dogma of “art for art’s sake.”

In order to find them once more in our own times, we must seek them in the nursery or the Board School class-room. The artist of primitive times survives by atavism in the child. But he substitutes for the rock-wall of the cave and the mammoth’s tooth his slate, copy-book, school-books, often enough his desk and form, which he adorns with drawings that, if not particularly finished, are, nevertheless, always full of expression, and recognisable. The child does not give way to his artistic wantonness in order to please others. He hides it, moreover, mostly for obvious reasons, from the eyes of strangers; he only draws to portray symbolically that which has made a strong impression on him. He always notes down the important, distinguishing features which have struck him in the phenomenon. This fierce mustache, the circle drawn across which represents the head, is for the little draughtsman the characteristic of manly dignity; this right-angled broken stroke, which bristles up over a row of men, is the formidable bayonet that marks the soldier; this disproportionately big stick in another man’s hand is the dreaded badge that embodies the schoolmaster’s power. The young artist has obeyed genuine impulses. His art forms really spring out of the deep grounds of his emotion.

With advancing civilisation, however, this state of things quickly changes. The artist soon notices that he is differently conditioned to the rest, the average men; that his feelings are keener, their manifestation more expressive than with the latter. He becomes conscious of his superiority, fancies himself something in regard to it, and cultivates it. Other men find æsthetic pleasure in his creations, and encourage him by flattering applause which easily rises to admiration. That calls forth an energetic metamorphosis in the inmost processes of his work, in its causes and aims. What was once organic necessity now becomes craftsmanship; uncontrollable inspiration is replaced by custom and by style. The artist becomes his own imitator. In years of cool, methodical, routine work, he simply calls to mind the moment when the feverish workings of his brain powerfully drove him into the paths of art. He observes all rites of the creator by impulse, but they are now only an attitude which he has learnt. In theory he is still inspired by impulse; practically, he is a professional craftsman who performs the day’s work imposed on him by intelligent volition. He is still always in search of self-satisfaction whilst engaged on works of art, but it is of another nature than that of the unsophisticated artist. The unconscious aim of his efforts is not to find relief from an emotional tension: he strives after the voluptuous feeling of flattered _amour propre_; he grows ambitious, very often, indeed, only vain. He thinks of his public. He anticipates his success. The thought of approbation takes the place of the effort to deliver himself from a painfully obsessing conception.

This also is always the psychology of the born artist, who is one because his organisation forces him to it. Beside him, however, swarms the innumerable crowd of imitation artists, of average, and very average men, who would never of themselves have thought of becoming artists—men who would never have discovered art of themselves, if they had not had before their eyes the example of the original artists, their successes, their recognition by civilised society. These individuals pursue art, not to deliver themselves from an obsessing conception, but as a means of attaining privileges, gold, and honours. For them art is an avocation like any other, a trade learnt, which is to bring them, not to subjective psychological, but to practical and social ends. They try by a sort of mimicry to become like the original artists, but they belong to another species. Nevertheless, it is not permissible to neglect them in this consideration, for, for one thing, they constitute the vast majority of artists, from the moment when the pursuit of art has become a differentiated activity, the habitual and exclusive occupation of a separate class of society; and then the productions of these imitators are always modelled after works done through organic necessity. They are, to a certain extent, the small change of originally great values; they would like to be changed for them, and everything which is to be said of any particular problem of art, necessarily finds its application to the imitations as well as to the original pictures.

These are then the origins and stages of development of art. At the outset, it is actually what the school of “art for art’s sake” asserts of it: a subjective purpose, a satisfaction of an organic need on the part of the artist. Soon, however, the artist ceases to confine himself to satisfying himself in relieving himself; he also seeks to please others. In the most secret and mysterious moments of creation, the thought of other men is present in his mind; considerations as to effect and success are mixed with his productive emotions. Substitute mere craftsmanship for inspiration, then these considerations become more and more dominant, and when art has once become a regular ordinary business, and the imitators, the mere echoes and reflections, have once become the majority among those who practise it, then the artist has his eyes continually fixed on his tribunal, viz., society. In the moment his work of art is germinating, it is strongly influenced by consideration of the known or the supposed taste of the society whose applause the artist courts, and the work undergoes a development more or less remote from the form it would have acquired under the pure influence of emotion, its primary source.

Society naturally sees what place it occupies in the artist's mind, what share it has in his creations, and how important to him its verdict is. It promptly perceives its advantage. It takes possession of the artist, forces its tastes on him, and insists on his working, not for himself, but for it. Henceforward it has in him a paid servant; he has to conform his special energy to the general plan of the society organism of which he is a part, and, in this way, a manifestation which was originally a purely subjective performance becomes a social performance.

Art, engendered by individual emotion and transfigured into a social work, shares this lot which we have no right to call a degradation, with innumerable other main instincts, strivings, desires. It is the peculiarity of civilisation that it subdues to itself human emotions, and applies them as motive powers for the purpose of creating results which are not always, which are not even frequently, the natural purpose of these emotions. The whole existence of society, every organisation, every civilisation, rests on the application of this method; in fact, every attitude and action of man is affected by an emotion at its base. Without emotion, man is a sluggish mass, with which nothing can be done. In order to get anything from him, he must first have his mind excited, and after that we must be able to direct this excitement. All usages and regulations are merely a collection of channels dug in order to act as conduits to the emotions, and to utilise their force in regular employment. By the help of the emotions of love, society has been enabled to create marriage, which does not serve for the satisfaction of the instinct, but should guarantee economic security for the wife and children. With the emotion of sympathy—this preliminary condition of every social structure—with this fount of pity, altruism, and solidarity, mankind has created the political order, the State, with all its burdensome tyranny, which seems no longer to have anything at all in common with sympathy, which is, nevertheless, its emotional root. With the emotion of mysticism and superstition, society has produced practical morality and all its constraint; with self-love and vanity, patriotism and its caricature, Chauvinism; with the wicked impulses to destruction and murder, the professional qualities of the soldier, still indispensable for the security of the political organism. In short, the whole work of civilisation consists in making itself master of individual emotions, diverting them from their natural goals, applying them to the good of the whole body. The State society is a machine that is moved only by the emotions of individuals. Social life is simply the product of a very complex and skilfully conducted work of primitive emotions. If, therefore, any one exclaims slightingly at the mention of the social productions of art: "That's common, rank utilitarianism!" we are justified in shrugging our shoulders. Utilitarianism? Why, certainly. Utility is the primary law of every society, of every living organism. The lowest living creature of one cell could not support itself for a single instant, unless all its parts were continually working with the object of promoting its existence, of serving the demands of its life—in short, making themselves useful to the whole.

When men came to observe that they possessed among them beings who had stronger emotions than the rest, and made these emotions evident by creations which were calculated to make a deep impression on other men, they, according to the standing rule—I might say, according to the biological rule—of society, made haste to place these exceptional natures, these artists, in the service of the great interests of society.

Whoever can still entertain a doubt that art has always performed a task which was by no means æsthetic, even if fulfilled by æsthetic means, let him cast a glance at the history of the arts.

Let him read the poems of antiquity, gaze on the sculptures and paintings of the Egyptians or Assyrians or Greeks. Let him listen to the far-off, and doubtless sadly distorted echo of ancient music in the Hymn to Apollo, restored by over-daring scholarship. Where will he find a work—a single work—which corresponds with the psychological scheme of the origin of artistic creation and with the definitions of the party of "Art for art's sake"? Where is the work that has been achieved purely for self-satisfaction, for the relief of the artist's nerves? Where is the work that is only to serve beauty? I cannot see it; but what I do see is that all known works serve some purpose of society. They glorify the gods, the kings, the commonwealth. They extol the dignity of belief, of government, of the mother-country. Homer shows the heroes of the Hellenic race in the bloody apotheosis of their exploits. Æschylus, Sophocles, and Euripides unfold on the stage the myths and sagas of their ancestors. On the Acropolis, in the Parthenon, gleam the gods of the mother-country, the guardians of the commonwealth, shaped by the magic chisel of Phidias. The Stoa, the Poikile, the Stadium, are peopled with the monuments of athletes, warriors, archons, legislators, of all great men who are the people's pride, and are to serve them as models. Tyrtæus chants his sublime marches to excite the warriors to fight for their country. The singer of the Hymn to Apollo composes his cantatas to make the temple service more impressive. I am well aware that, besides these monuments, there are the little lyric poems of the Anthology, the charming little Tanagra figures, that is to say, very individual revelations, which sing the joys and sorrows of a single soul, which seize the graceful movements and gait of young women who had enraptured a single kneader of the clay. But these pretty little things, although _chef d'œuvres_ of their kind, are not, however, to be compared with the triumphant creations prompted by religious belief and patriotism, whose superhuman splendour fills the centuries.

If we go from pagan antiquity to the Christian Middle Ages and the free-thinking or the openly atheistic Renaissance, the _rôle_ of art remains unchanged. For whom does the artist work? Only for the Church and the palace. The pope, the bishop, the abbot demand of him the decoration of the cathedral and monastery. The priest under the vaulted arch, the monk in his refectory—these must have before their eyes images to remind them of the doctrines of which they are preachers and servants. The people, when they enter God's house, must be caught hold of by the representations of suffering and martyrdoms, of beneficent and comforting miracles, of the horrors of hell and the bliss of paradise, and be strengthened in their faith, seeing with their eyes and touching with their hands what religion teaches. The king's castle, the palace of the great vassals, plume themselves on the works of arts that are consecrated to the glory of their ancestors, of their rank, or, simply, of the dominant system. Here the stately tombs of kings or knights, here the statues showing the ancestor as hero or demi-god. Here the pictures of battles and sieges, of butcheries and victories. Here the painted memorials of great state ceremonies, triumphal entries, receptions of ambassadors, conclusions of advantageous treaties, famous meetings of mighty lords. The object of all this art is always to flatter the vanity of the great, to impose on the populace a high notion of their wealth and power, to make it feel, by all possible means of expression, the superiority of its leaders. We must go down to the Italian Renaissance in order to discover, by the side of religious, dynastic, aristocratic, and political art—for historical art was always designed to serve a political idea or arrangement—in order to discover, I say, by the side of this prescriptive art, the beginning of a purely æsthetic art. When Mantegna paints the "Muses on Olympus," or Leonardo the "Mona Lisa," they are no longer desirous of kindling faith or strengthening subjects in obedience, but they want to enrich and brighten existence. But whose existence? That of a wealthy and distinguished patron, of him who has placed the order with them. It is not before the Renaissance that we see the artist gradually emancipate himself from the rule that sternly dictates to him the choice of his theme, and even, up to a certain point, the method of his treatment. He then acquired to some degree the freedom to follow his own power of imagination, and could hope to get a return for his creations, even if he did not serve a dogma or a policy, even if he did not glorify a saint, a king, or a nobleman; if he simply tried to move a man's soul by revealing the secret movements of a human soul.

We see then that, through long centuries, art had the sole task to serve the great institutions of society: religion, monarchy, or one's native country under another form of government, the dominant castes. The mechanism by which art was held in bondage was the simplest and most naïve: the artist had no other customer for his works except the powers that be. These bound him by his necessity to eat daily, or nearly so. The Church, the king, the republic, the city, the ruler, gave the artist commissions, and paid him. If he found no patron in the castle or palace, he had no gold or honour to hope for from any other quarter. Now neither the Church, nor the Government, nor the privileged classes were in the habit of throwing their money out of the window. The money they expended had to bring them profit. They wanted the artist in their pay to become a champion for their cause, in exactly the same way as the cross-bowmen of their body-guard, their judge, their herald, steward, aye, their jailer and executioner. Art, in those days, preached the fear of God and his servants, submission to the king and the State, respect for nobles and officials. The ruling powers made the artist suggest to the people all that was favourable to them. Art was the school of the good subject, the artist the main prop of priestly and monarchical-aristocratic society. The common herd, the million, found none of their human emotions satisfied in art; the voices that rang out of these works only cried to them: "Pray, obey, tremble."

The Netherlanders, a free people, were the first to know an art other than the traditional one. In Flanders and Holland, writers, and especially painters, began to speak no longer exclusively of God and the saints, the king and the great, but of the humble, obscure, and nameless multitude. _Genre_ painting revived for the first time since ancient days. It told the everyday life of the middle and lower classes, their somewhat gross joys, their somewhat commonplace sorrows; it showed the ale-house and the mill, the sitting-room and the retail shop. This was not edifying, it is true. The philosophy of this art is low; it hardly widens the spiritual horizon, and is of poor comfort amid the narrowness and bitterness of real life. And yet this art was a forerunner. It denoted a turning-point, the beginning of great and important things. One great king, Lewis XIV., was not deceived about it. With the sharpened keen feeling of the mighty for everything that can encroach on their superhuman dignity, he perceived at once that this new art offended against his kingly majesty. How? There are painters who dare to treat of plebeian subjects! What should that mean? Does art perhaps even fancy that it can be other than a continual homage to the greatness and omnipotence of kings? And, with an annihilating wave of his hand, he banished from his august presence these daring little pictures, these democratic works of Teniers, Ostade, Dirk Hals, and Gerard Dow, whilst uttering the historic words: "_Enlevez-moi ces grotesques._"

But time stands not still; development is achieved. Modern democracy appears, and transposes all the conditions of existence of society and its members. Art cannot escape the general revolution. It experiences its influence spiritually and economically; changes its judgment hall and its mart. We do not realise the tremendous meaning of this change. The court that decided as to the worth of the artist and his work was formerly the small circle of possible patrons—princes of the Church, the great, the courtiers.

To-day this court is criticism, professional criticism. In earlier times it was enough for the artist to please a few people, perhaps only one individual, if the latter happened to be a magnate. He had not to trouble himself about the crowd; moreover, the crowd followed docilely the lead from above. When Dante said:

“Credete Cimabue nella pintura Tener lo campo, ed ora ha Giotto il grido, Si che la fama di colui oscura;”—

What did _grido_ mean? What was _fama_? It was the opinion of a court, that of Rome or Pisa, perhaps of Ravenna. We must go to Aretino to discover a specimen of an art critic who was neither a Mæcenas like Leo X. or Lorenzo the Magnificent, or even a painter like Vasari, but merely an audacious spirit who arrogated to himself the right of dealing out praise and blame, and conferring glory in the name of something absolutely novel, in the name of public opinion.

From that time it is professional criticism which suggests to the multitude, and imposes on the mighty, its judgment on the artist. But the criticism is disinterested, or at least can be so. It does not expect of the work of art a direct personal advantage, its own glorification, the vindication of its spiritual and material influence. Its measure, therefore, grows larger and broader. It brings to its office philosophical and æsthetic considerations, which the popes and kings could not know when they gave commissions to the artists, their _protégés_. In order to secure success, the artist must now please the critic—many critics—and the latter pass a verdict on him with perceptions, with taste and spiritual prepossessions that very seldom are those of the bishops and great men.

And as the artist has got another tribunal, he also comes before the public under other material and spiritual conditions, and seeks in other ways a market for his work.

In feudal times, as we have seen, the church and palace were the places for works of art. They were seen there under circumstances little favourable for a purely æsthetic appreciation. In the cathedral people were intimidated by the significance of the vast space, the acts of faith, and the perfume of incense; in the castle, by the magnificent garments of the officials, and the weapons of the guard. It was in 1673 that a “Salon,” _i.e._, a regular art-exhibition, was opened in Paris; and besides the “Salon” public museums were opened everywhere, to which every one had access without invitation or introduction. The artist was now quite independent; he could work without waiting for orders. He no more needed, in order to become known, to crave humbly a visit to his possibly poverty-stricken studio. Here was a definite place where he could exhibit his work to thousands of spectators—connoisseurs, judges, possible buyers. From that time he worked with an eye to the great public which was sure not to be lacking at his regular rendezvous. If the professional critic became his judge, the mass of people became his Mæcenas. Universal suffrage has dethroned Church and royalty, and remains the artist’s only patron.

I say expressly—the only. It still happens that the State, _i.e._, a high official, perhaps a monarch, orders works, assigns to the artist the task of adorning churches and palaces, perhaps even public places and walks, or even creating a monument of political import. But who receives these commissions? The artist pointed out by public opinion, _i.e._, the democratic crowd acting under the suggestion of the critics, who also belong to the crowd. The artist who has gained the advantage of an officially favoured position otherwise than by popular acclamation, who owes it to the whim of a ruler, the mere favouritism of a bishop or some other great personage, is nowadays not esteemed, but despised. He may receive some alms in the shape of money; he may collect ridiculous titles and wretched tags of coloured ribbons, but he will be branded with the name of court-artist, and this name excludes him irredeemably from fame.

The literary man in earlier times lived by the favour of a protector, whom alone he had to trouble about pleasing. Nowadays he lives, through newspapers and books, by the public at large. The dramatic poet had, for his productions, only the subsidised theatre, the theatre royal, which imposed on him its regulations. To-day this theatre is insignificant as compared with the free and independent stage, and the poet need know no other care and consideration than that of getting a good grip on his public. Then the artist had nothing to hope for, unless he served religion, the monarchy, or the aristocracy. Now subjects from these spheres have actually become laughing-stocks—_pompiers_, as they are termed with an expression of contempt; and the artist, if he would become rich and famous, must fish for his subjects in other streams of thought. This is so true that there are rulers who, from feeling that art is making itself independent of them, and will no longer serve as the herald of their thoughts, try even to produce works of art, and would impress their works on the admiration of the multitude, which, nevertheless, does not admire.

The great revolution is consequently accomplished; art now works only for the masses. It is still always the State that commissions; it is still always the few rich who buy; but it is really universal suffrage that imposes on them its own inclinations. But we do not believe that that new Mæcenas, the people at large, has other habits of mind or ways of acting than had the Mæcenas of the past. The people too, exactly like the priests and kings of old, demands that art should please and flatter it. But it further demands

something else, something more than pleasure and obsequiousness—viz., a high satisfaction, a corrective of an evil of which it is perhaps not clearly conscious, but which, nevertheless, it feels strongly. And I will now try to point out this evil.

One of the most striking phenomena of modern life is specialisation applied to all departments. Every one tills merely a very little bit of field or rather he ploughs only one and the same furrow. This is true of mental craftsmen. It is still more true of handicraftsmen. What existence does such a man lead nowadays? There is no longer one who fabricates an entire chair. One always makes the arms, another the legs, a third the back, a fourth the cane-work. A knife goes through a dozen hands, a needle, I believe, through thirty. In order to attain that extreme skill which competition demands of him and which he must supply, if he would earn his bread, the workman continually repeats the movement, becomes a machine, less than a machine, a tiny part of a machine, a single wheel, a single screw. His being shrivels up, his soul suffers. All development is denied him; all his faculties, except the one he is always employing, become crippled, and disappear. The man gradually sinks almost to the low level of a polypus, which is only an organ of a hydramedusa.

Whence comes the strange fascination that the foremost men of the Italian Renaissance exercise on us? The reason is that they were complete men. All their faculties were fully developed—all that offered a possibility in them was developed to the utmost. Nothing human was alien to them. With marvellous freedom they circumscribed the whole circle of human knowledge and faculties. Then the learned man was an universal scholar; his knowledge was encyclopædic. The poets were at the same time men of action. Men of rank were artists and writers, and the artists were all they wished to be. Michael Angelo painted, modelled, built the cupola of St Peter's, and wrote charming verses. Benvenuto Cellini handled the spatula as well as the mallet, the crayon as well as the pen, and the sword as well as all these tools. Macchiavelli governed as wonderfully as he wrote, and Leonardo painted the "Last Supper" between a musical composition, a treatise on mechanics, a plan of a fortification, the model of a triumphal car, and the plan of a canal for the purpose of irrigation. Count Castiglione's "Cortegiano" shows us the ideal of the man at the time of the Renaissance. He was probably the fairest flower ever produced by the human plant. The modern man may envy him; he can never be his peer, but must shrivel up in his narrow corner. Hypertrophy of a single, often subordinate faculty, atrophy of all the rest—such is the lot to which he is ruthlessly condemned. And there is no change possible in respect of it; no herb grown can prove an antidote to that bane. Division of labour gives to the whole advantages too great to be dispensed with out of consideration for the individual. Division of labour is the true condition of all progress, though in this case, as in so many others, progress exacts a heavy, very heavy, price for its services.

Every one is painfully aware of this reverse side of progress; many consciously take themselves to task for it. Why has the madhouse philosophy which extols the superman been able to subjugate spirited youth? Because it meets the longing for a fuller life of the personality. And anarchism? What is the secret that makes it attractive to true consciences and loving hearts? Nothing except that anarchy seems to promise unchecked development of the individuality. In all these nonsensical, wild, and criminal movements there is some little revolt against the pinching and tightening in of the personality entailed by the modern conditions of labour, and this is the ingredient that recruits adherents among those unaccustomed to rigorous examination of their thoughts. And when the workmen demand an eight-hours' day, what do they want? To find time to go and drink at the public house, to be able to idle, as the ill-wishers who calumniate them assert? No; they want to have a few hours in which to cease to be mechanical tools, in which they may again be men, and participate in the great life of the community.

But by what means can we give back to men what division of labour and specialisation—these irrefragable consequences of contemporary progress—have taken from them? By what means can we remake beings developed from them harmonic? Perhaps in a very distant future science will effect this necessary, demanded, and longed for miracle. Perhaps mankind will once more see these workers who earn their bread during a part of the day by handicraft, and during the rest of the time linger on the highest summits of human thought and knowledge; a Socrates, who is a stonemason; a Spinoza, who polishes spectacle glasses. But, as I have said before, that will be feasible only in a very remote future, for science is not easily accessible; the way leading to it is long and rough, and the full life through science is possible only to men of a higher spiritual development than the average people nowadays.

But if science is no longer the usual companion of the man of the masses, and, unfortunately, will not be so for a long time, art, on the other hand, admits him to familiar intercourse. No tedious initiation is requisite for it, nor any hard labours which the majority cannot perform. It is sufficient to have eyes and ears, and a human heart in one's breast. After an apprenticeship, which may be very short; after some habituation which one easily acquires by intercourse with beautiful works, almost every one arrives so far that, even if he cannot appreciate the technical and philosophical merits of a work of art with consciousness, yet he can feel its charm and be susceptible of emotions from it.

Art it is, then, which can give to modern humanity what it most needs—the means of attaining the full life. Here lies, unless I am deceived, the greatness, the lofty mission of art in a democratic society which rests on a civilisation, the marks of which, the real condition of which, are severe specialisation and division of labour carried to an extreme.

Art raises man out of industrialism and introduces him to a higher world. In this artist-created world the man who is bundled together stretches himself straight; the shrivelled broadens out; the fraction of a man becomes complete. Here he who belongs to his machine or observation-instrument becomes once more a free man and citizen of the world—a man participating in the life of the community, and enjoying with the rest all the beauties of heaven and earth, all the greatness of heart and soul of the pick of men. Through art a person imprisoned in his daily avocation comes into communion with all civilisation. Here is the paradise to which the astronomer descends from his constellations, to which the miner ascends from his pit, in order to participate in the same joys and raptures, to bring to flower whatever potentialities they possess. The mission of art in society present and future is, in short, to liberate the prisoner of subdivided labour, to restore the dignity of manhood to the being degraded into a little wheel of a machine.

But art, which is to fulfil this new and lofty mission, cannot, manifestly, be conventional art. On this theocracy, monarchy, and aristocracy have stamped the character that suited them. The multitude at the present day find no sort of joy in works which depict to them the bliss of paradise and the torments of hell, which extol some paste-board king with crown and sceptre, which offer for their admiration the greatness of blue-blooded privileged beings. Like the patrons of earlier times, the people, who now represent Mæcenas of old, are interested in art only for themselves. The sources of their emotions in art are the emotions of their own lives. In the work of art that is to attract them, they must find themselves again, but, as formerly the priest and king did, magnified and ennobled. The work of art must show him his own likeness, but a beautiful one; it must raise the people in their own eyes, and teach them to respect themselves.

This the common realism has not comprehended, which broke in on art with a din, and dared to call upon the democracy. The genuine people has never had a mind to realism of this sort, but has always dismissed it roughly. The rough proof of a hateful and tedious reality, such as the pictures of Courbet or Bastien Lepage, has never attracted any but the superfine, and this only, by the well-known psychological law of contrast, whereby an impression that is the exact opposite of the usual impression can impart a pleasurable feeling for a short time. The rich and luxurious like to see works of ugliness and misery; the poor and afflicted do not like them. It is the same in regard to literature. Reluctant protests have frequently become loud, in these socialistic days, against the realism which a party organ offers its readers. The working class do not wish to know anything about this realism which professes to be modern and democratic, yet is, in reality, only wretched and repulsive. It coops them up in the narrowness of their everyday existence, but their wish is to get out of it.

Pictures such as Millet's, sculptures such as Constantin Meunier's—works which seek to show the dignity and beauty of the occupations of the masses, which constitute a hallowing of work, an apotheosis of the tragedies and idylls, of all the sweet and bitter emotions of the people's life—these works, to my thinking, exhibit the type of future art.

Some great genius will, perhaps, find another formula. What one may, however, say for certain is this, that the art of the future will not be realistic in the narrow sense of the word. But it will not be mystical and æsthetic either. The people will never interest themselves in half-tone angels of boundless length, in violet-hued Virgins with lilies in their hands in a conventional bush, in enigmatical, mysterious verses. And esoteric art will never give the people what they need, viz., the liberating ideal. The art of the cultivator of the Ego, the _dilletante_, of the snobs of a Talmi-aristocracy, presumes to demand the future for itself. Is that to be an art of the future, an art of progress? One can only laugh at the notion. The art of the future will be no "little chapel," but a mighty cathedral, wide enough to admit the whole of mankind. And that will be exactly its vocation: to be the hallowed place wherein mankind will rise again to the childship of God for which religion has educated them in past stages of evolution.

II

SOCIALISTIC ART

CONSTANTIN MEUNIER

Is there a socialistic art? Can such a thing exist? So far as Socialism is an economic and political philosophy it is hardly comprehensible with the means of expression of art. If the plastic arts are to be instructive, they do not amount to more than chill

symbols and halting allegories. On the other hand, they are not prevented from digging down to the psychical roots of Socialism, and presenting the fundamental feelings and ultimate intuitions from which it springs. One of these fundamental feelings is pity for the disinherited. One of the ultimate intuitions is that of the dignity of all work done with moral earnestness and entire devotion.

The artist can show us the destitute, to whose presence amidst our civilisation applies more sharply, what the Psalmist[2] asserts of the life of man in general: “And if it has been splendid, it has been toil and labour”—toil and labour without a ray of happiness; severe physical exertion rendered more wretched by sorrow and distress. Such a picture grips our hearts, and urges on us painful questions: is this misery inevitable? Is it cruelly ordained by nature herself or a consequence of faulty institutions, capable of improvement on the part of man? Cannot we introduce into the lot of this ill-used brother something of joy?

And the artist can also show us the worker, not in want and suffering, like the beast of burden, humiliated into the slave of matter, but rather as creating eagerly, proud of displaying his strength, joyful in the conviction of success, regarding his skill as his honour. This aspect fills us with respect, perhaps with admiration. It opens to us the comprehension of the import of the workman, and the lofty reality of his achievement.

In both cases the artist fashions fully from life; he need not exaggerate, he need add nothing; he can confine himself to the plain facts of life. He need not betray any prejudice or any extra-artistic aim. He will, nevertheless, so contrive that one will be able to speak without falsification of his art as of a socialistic one. For his work will put the spectator in the mood in which he will be inclined to hail as progress every transformation which can improve the earthly lot of the worker, and increase his value in the community.

The school of æsthetes, which maintains the principle of art for art’s sake, will, I grant, admit works of this sort as a form of Socialism, indeed, but not as a form of art. I do not belong to this school. I oppose it at all times and everywhere as strongly as I am able. I am convinced that art has a social mission which reaches far beyond mere gratification, that it must necessarily be moral, and, in the highest sense of the word, useful; not useful in the simple way of painted or chiselled aids to intelligence, not moral in the vulgar way of tracts; but moral through stimulating what is most human and noble in our spirit and soul, and useful through educating us to deeper and wider conceptions of phenomena. In one point, however, I agree with the heralds of _l’art pour l’art_—I demand beauty in a work of art; not beauty alone, but beauty in the first place.

In order, then, that we can speak of a Socialistic art, the works that would deserve this designation must not only excite sympathy with the disinherited, and respect for the workman, but they must also arouse æsthetic feeling, they must be beautiful. This claim, of course, excludes no kind of beauty. The tragic is absolutely beautiful. Purification is one of the most powerful æsthetic influences. Truth can be beautiful if essential and expressive. The socialist who would prove himself an artist must possess the lucky gift to see and exhibit beauty in the figures and actions of the class of society for which his heart beats.

All these conditions no contemporary artist known to me fulfils in the same degree as Constantin Meunier, the Belgian sculptor, painter, and draughtsman. Meunier died an old man in 1905. He was born in the ‘thirties’ of the last century. The world was slow to recognise him, not because he did not deserve recognition, but because he did not seek it. He was big and unassuming. He lived quietly in a little Belgian town as a teacher in an art school, and modestly avoided the roar of fame’s mart. He had even refused to allow the reproduction of one of his noble bronzes, for business purposes, by a first-rate Paris house which was prepared to pay a munificent price for the right of sale. He was loth that his piece should become a factory-cast and a shop-window article. He belongs to the narrowest circle of the blessed, of the chosen. He is one of the Prometheus-like artists; he informs and inspires life. He feels like a Samaritan, he thinks like an apostle of the submerged, who utters a great cry of wrath over the harshness and unrighteousness of the social scheme, and he compels the bronze, like a Benvenuto Cellini, translated from what was aristocratic and classic into that which is modern and democratic.

In Meunier’s work there is a unity from which he seldom digresses. He lived in a Belgian district of coal-pits and smelting furnaces, in the very midst of rough labourers who passed their lives in the galleries of mines, or in the fiery glow of furnace mouths. He found his models among these figures. There the Labour movement in Belgium arose—one of the most rapid in Europe; there Meunier’s art grew up—one of the most intensive at the present time. The miner and the iron-smelter are his heroes; he admires their strength, and from the bottom of his heart he bewails their pains. And if he is unfaithful to his Cyclopses, it is only, touched and enraptured, to look after his other darlings—the country folk working in the fields, a subject which instils in him as much reverence as the burrowing of the coal-miners underground, and the powerful hammer-strokes of the iron-smiths.

One of his greatest creations, perhaps his greatest is a bronze a span high, representing an old woman, the wife or, as I would rather assume from the stormy intensity of her emotion, the mother of a miner, who, after a driving storm, has gone to the mouth of

the shaft of a coal-pit, to which the corpse of some one belonging to her has been brought.

The woman stands there, leaning slightly forward, her countenance petrified with dumb despair, her arms limp, her one hand lying in the other, yet without any convulsion, and powerless, her knees through a very slight bend betraying her trembling, her feet instinctively somewhat turned inwards, so as to give a broader support to the body, and to protect the almost crippled figure from falling down. The whole is such a frightfully expressive picture of a poor human creature who has, as it were, received a blow on the head, and in her crushed condition is not strong enough even for sobbing and wringing her hands, that it strikes the spectator with a cold shudder. Observe, the old woman wears the garments of the poor Walloons, heavy, stiff gowns and neckerchiefs, the hard angles and folds of which can express only very roughly and indistinctly the soft play of the weakly-quivering muscles. What penetrating keenness of observation does it need to recognise in an entirely self-contained form shrouded in uncouth, shapeless clothes, without gestures or play of features, and to imitate, without the slightest exaggeration, yet overpoweringly, the tenderest lines which, even in such unfavourable conditions of material, express clearly and dramatically all that is passing in this almost impenetrably veiled human soul. This little figure, no larger than the decoration of a clock, is a great monument, and, like every real work of art, it points far beyond the limits of itself. It reveals much more to the power of imagination than it manifests to the eye. This is actually proved in this very case; for Meunier has a group which supplements the work described: the same old woman, and before her, lying outstretched on the ground, the corpse of him whom she is bewailing. We might think that this more complete work would be more deeply affecting than the fragmentary one. The contrary, however, is the case. The corpse, although modelled so exquisitely, leaves us cold; it does not realise the conception we have formed of it. We had expected to feel a horror at the sight of it, at which the blood would congeal in our veins. We are astonished and disappointed at seeing lying there only an unknown man who does not concern us. When we look at the old woman petrified by grief we think of the corpse which is not exhibited to us; we see it with our spiritual eyes in the horror of the old woman, we share the feelings of the old woman, the unseen corpse is that of a relation of our own, the dead man himself is dear to us, we ourselves have suffered the loss of him. On the other hand, the completed group makes any co-operative exertion of our imaginative powers superfluous.

The corpse lies there visible; it distracts our attention from the old woman; we feel less keenly her emotion; the incident no longer occurs in the Holy of Holies of our soul, but in a forecourt, in a place of inspection. We could, in imagination, endow the corpse with the features of a dear relative, and feel sorrow for the dead man: inspection teaches us that the corpse is a stranger to us, and we have no grounds for shedding tears over it. The two works, placed in juxta-position, fully bear out the old dictum, that a work of art is more powerfully effective in proportion as it more strongly excites our imaginative faculties to creative co-operation.

A series of works brings before us the life of the coal-miners. Some of them come to daylight after their shift is ended. They are tired, but cheerful. About their wearied countenances there seems to quiver a reflection of the hearth-fire which awaits them familiarly in their poor homes. Here is a miner at his work. In a painful, half-recumbent position he handles the mattock in the narrow gallery under the seam from which he is dislodging the coal. Here another is sitting inactive, with his spade and lamp, with only a pair of trousers on, the upper part of his body naked, without a particle of fat on his muscles steeled by toil. Here a worker at a smelting furnace, likewise sitting—a reminiscence of the famous “Les Foins” of Bastien Lepage, which is at present in the Luxembourg. Like this peasant lass, Meunier’s labourer is completely bestialised; he stares vacantly before him, with a jaw open like that of an animal; his hand, unused to inactivity, hangs down heavily. It is a shocking picture of the degradation of man through a one-sided exertion of the muscles; a forcible harangue in favour of the eight hours’ day, which would leave more time for the human working machine, not only, as his opponents assert, to visit the public-house, but also for spiritual life.

Meunier rises to the height of the Vedic hymns when he turns towards the countryman and his heroic deeds in nourishing mankind. In the relief, “The Harvest,” a band of reapers—four men and two women—are grappling with the ripe corn. One seizes violently the stalks, the second, bending forward, makes a wide stroke with his sickle, a woman binds into sheaves the ears that have been mown. In the background, one longing for rest looks at the position of the sun, and another, _rapido fessus aestu_ (fatigued by the scorching summer heat), to use Vergil’s words, wipes the sweat from his brow. There is the note of the Eclogues about this work. Over it floats the consecration of the lofty act with which the rooted son of the soil, the ploughman—the creator and bearer of all civilisation—gains the bread of mankind out of the earth. A single figure, “June,” is also created from this emotion. It is the realisation in free sculpture of a _motif_ from the relief. A reaper, stripped to the waist, emaciated by the heavy toil of harvesting, exhausted by his day’s work, leans upon his scythe and glances, shading his eyes with his hand, at the sun—“I would it were bedtime and all was over.” One would like to press the hand of this brave, good fellow, or at any rate that of the artist who has represented him to us so faithfully and straightforwardly.

All Meunier's works have not this delicacy; many are weak, some absolute failures. As an instance of such I point to "The Puddlers," though it has been particularly admired by some critics. Three iron-founders stand at the open stoke-hole of the puddle-furnace, and feed it with mighty pieces for melting. From the opening issue steam and smoke, which curl round the three men wielding rakes and tongs, and eddy upwards. Meunier has tried to represent this steam in sculpture. He has given it a concrete form, necessarily the same corporeality as the bodies, tools, blocks of metal, the flaming furnace; for sculpture possesses no means of differentiating the thickness of matter, when it abandons the mere engraved line or the make-shift of various perforations. The result is, that instead of smoke there is an amazing image which partly reminds us of an untrimmed dab of plaster, partly of a weather-beaten stalactite. Meunier was originally a painter, and took to sculpture only late in life. His "Puddlers" are formed with the technique of a painter, from which the artist did not immediately emancipate himself. Another relief, "The Bricklayers," is absolutely a mistake. Two men are standing in the loam-pit and handing up the bricks to their mates above. They do this with theatrical gestures, as if a conquered king were handing over his crown to his conqueror. The contrast between the bombastic movement and its vulgar purpose is so grotesque that the picture has an irresistibly comic effect. Here Meunier is, for the only occasion in all the works of his with which I am acquainted, insincere and affected. I have looked for a long time at this deplorable work, and it made me thoughtful. How heavy is the responsibility of the critic! Supposing I knew nothing of Meunier and only saw this work, I should find it hard to resist the impulse to abuse him in the sharpest terms, for it unites the two worst faults that can be found in a work of art: it is at the same time inanely futile and obtrusively pretentious. So far I should be acting within the scope of my perfect rights. But am I certain that I was not allowing myself to be carried away by my own natural propensity to generalise, and to condemn not only the work, but also its author, to call him a bungler and a botcher? Such a verdict would, apparently, be well-grounded and, in fact, revoltingly false. Works such as "The Bricklayers" are a warning to the critic; they admonish him to be conscientious. Their teaching is that every comprehensive verdict on an artist must presuppose a knowledge of his whole life's work, and that no single work can offer sufficient basis for the general appreciation of its author, especially of his depreciation.

In his figures of the miners and iron-founders, Meunier showed sympathy with the lot of the proletariate; in his portrayals of the countryman's life, reverence for the civilising work of the man who ploughs the soil. But he reveals in certain other works of similar subjects beauty which prevents us from wishing for one moment for those Invalides of Olympus, the unchangeable troop of academic sculpture. The "Blacksmith" wielding his hammer, the "Harbour-Workers," the more than life-sized "Smith," are discoveries which are tantamount to revelations. Especially this smith in his working garb, with his stiff leather apron, leggings, and the foot coverings that are intended to protect him from the sparks. Leaning on the tongs that are almost the height of a man, he rests his hand on his hips and waits until it is his turn to attack the work. There is a proud tranquillity, and a reserve of ready strength in him that carry us away. This artisan is every whit as handsome in his way as an antique statue in a toga of ample fold, or a noble nudity, or a knight in romantic armour. His body possesses the elegance which perfect fitness confers, his movement the energetic restraint that the workman, thrifty in exerting himself, acquires through being in the habit of avoiding every prodigal expenditure of his strength. Meunier trains our eyes to appreciate the æsthetic charm of this phenomenon of our own days, which great art has hitherto stupidly passed by.

Of what expressive poetry Meunier is capable we recognise with admiration in a statue of an animal, the mine-horse—one of those unfortunate nags which are brought to the mine as foals, in order to draw the coal waggons to the galleries, and who are condemned to spend the whole of their lives in the bowels of the earth, far from the sun. The animal's head droops, its lips are flabby, eyes half-closed, ears sunken, flanks fallen in; the whole wretchedness of an innocent creature condemned to night and woe is embodied in this shivering beast. The mine-nag has certainly no sense of its disconsolate fate; it does not miss the sun, or long for green pastures. It does not envy its luckier brothers who can skip in the fresh grass beneath the blue sky. Meunier has all these feelings for it; he infuses them into the animal's stupid soul; but doubly amazing is the power with which he himself can express through a coarse animal body humanly lofty tragedy.

What had already become clear to me when I saw Meunier's works separately in the _salon_ at the Champs de Mars, deepened itself within me, at the sight of the whole collection of them, into a certain conviction that Meunier is, perhaps unconsciously, a pupil of Millet's. He learnt from him to look with reverence on the homely men who with holy zeal, without gazing to the left or right, with body and soul in their work, wrest the works of civilisation from the forces of nature. He improves Millet's peasants and artisans into the plastic and monumental. It is the same simplicity, almost crudeness; the same contempt of pose, the same extreme energy of activity, and the same deep, inward life as in the master who painted the "Angelus." And what makes the most vivid impression on us in Meunier, as in Millet, is the ardent piety with which the sight of true and earnestly working people fills him—people who rise high in their apparently humble, yet fruitful and, through its connection with the corporate life of mankind, especially significant

labour. An artist, however, who discloses to us such outlooks on the path of civilisation, and such insight into the human soul, has some claim to a place near the acknowledged masters.

III

THE QUESTION OF STYLE

A history of style—I mean of style in general, not of one particular style—has, so far as I am aware, never been written. That I can understand. It would be a gigantic task, even exceeding the power of an encyclopædist. It would have to show from what spiritual peculiarities of the artist; from what necessities and intuitions of the time; from what requirements of the material, and from what compulsion on the part of the technique, the style develops, and it would have to measure the whole range of individual and national psychology, of customs, of material and of technology. The individual, however, whose powers do not suffice for an exhaustive and systematic exposition of the genesis and mutation of styles, can constantly register partial observations, and throw light on sections of this wide province.

Every human activity is excited by a need. We fabricate weapons, implements, shelter, and clothing, because we need them. In the earliest stages of human artistic skill, purpose and material alone control the productions of the human hand; style, so far as we can speak of such a thing, is purely constructive. It makes us recognise the influence of a small number of bio-mechanical and psychological laws—laws that have hardly varied during all the thousands of years in the history of human morals. These laws are those of the least effort and of selfishness. By virtue of the law of least effort we choose the most promising material, _i.e._, at which we have most conveniently to hand, which can be worked in the easiest way, or is most durable, and for that reason, more especially saves us the too frequent repetition of the effort. We choose the form to which the material employed adapts itself most readily. The problem which the constructive element in style has to solve is this: given a determined task which should be performed by an artistic expedient, how will this object be most readily, and yet most perfectly, attained with the material available?

The law of selfishness alters the natural course of the law of least effort, and often operates quite in opposition to it. The possessor of an object wishes to be remarked; he will distinguish himself from others, be admired and envied by them, whereby he will gain influence over their minds. He will therefore demand that for the object not the most easily procured material, but the rarest, and that which can be furnished only with the utmost difficulty, be employed, that the form require not the least, but greatest possible amount of labour. He will likewise wish the workmen to sacrifice the elegance of economy, not to represent what is alone real and necessary with the smallest expenditure of material, but, on the contrary, to lavish material, and make it quite visible and quite striking; to add to the Useful and Essential, also the Superfluous, so as to suggest the notion of wealth. The idea of elegance will alter its meaning. It will no longer signify the greatest suitability and perfect appropriateness, but, in the first place, costliness of material, difficulty of work, wastefulness—in a word, luxury.

The law of selfishness bursts the narrow frame of construction, and adds to style its second element, decoration. This, too, is still under the law of least expenditure of force; this, too, is still primarily subordinate to construction, _i.e._, utility, but it strives to render itself independent of the constructive element, and to become its own object. The history of each particular style shows this conflict between the constructive and decorative elements. At first construction rules alone; next, decoration, called forth by the _amour propre_ of the fabricator or possessor, joins it, but very timidly and very modestly. It obsequiously gets out of the way of construction, and contents itself with corners where the constructive element has nothing to do. But gradually it gets bolder, steps from its holes and corners, confronts construction, compels it to give way and take less comfortable by-paths, and finally subjects the constructive element entirely to its will and caprice, so that, in the decadent period of a style, a useful object becomes wholly unserviceable for its original purpose, and is only an excuse for decoration, which self-gloriously gives itself airs.

There is another contrast between construction and decoration. The constructive is the social element in the product of human labour; the decorative the individual one. I do not think that this dictum needs an elaborate explanation; it seems clear enough to me. In construction expression is given to a need which is, at a given time and in a given place, shared by many or all; it answers not only a condition, but a demand of the community. Decoration is—at any rate originally—the outcome of individual taste and individual imaginative power. Construction is a thing necessitated, and therefore _banal_; decoration is superfluous, and therefore charming. The former appeals to the understanding; the latter is fantastic and sentimental. The human consciousness is, however, so arranged that—for its gain? for its loss? (I have treated this question so often and so thoroughly in other places that I may here leave it undiscussed)—it derives its feelings of pleasure and aversion incomparably more from its sensuous than from its intellectual life. Wherefore, for practical purpose in style, only those who are most highly developed intellectually have appreciation;

on the other hand, for what is pleasing, all whose nervous system is susceptible to pleasurable feelings.

An individual decorative invention becomes style by the imitation of others, which can be slavish or free. A single work, a single artist, will never be felt as a phenomenon of style. There is the same difference between originality and style as between the picture of a certain person and the composite or average photograph of Galton. The feature of family likeness that runs through the works of one period and one place, however, like that which all members of a blood-relationship exhibit, is explained most simply through descent from a common ancestor.

Decoration is either organic or transferred. The former is the outgrowth of construction, and gives it a new meaning, unites to the idea of its purpose a simile that can be correct or false, pleasant or silly; the latter is added externally, and only aims at the beautification of the surface, without adopting living and necessary relations to the structure and destination of the object. Surface decoration may be pretty and rich, but it is always something subordinate, and always speaks of poor imagination and slight inventive power. Organic decoration is alone the outcome of a creative gift for art.

The psychical mechanism, which produces organic decoration, is always the same; it is the co-operation of association of ideas and anthropomorphism. I know very well that this latter is only a particular instance of the former; but I cite the really identical, nevertheless, as two apparently different ideas, so as not to become vague through too wide generalisation.

For the sake of clearness I will quote a concrete example. In collections, one not infrequently meets with a mediæval plane having the figure of a crouching lion with jaws open and a wild expression. It is easy to reproduce the psychic process through which this form arose. The joiner who uses the plane, and follows his own work reflectively, sees how the mouth of the plane, when applied, strikes the iron into the surface of the wood, and tears the splinters from it. What is more obvious than to think at the same time of jaws pouncing on the wood to flay and mangle it? The technical German expressions, _Hobelmaul_ and _Hobelwangen_ (plane-mouth and plane-cheeks) for the aperture in which the _Hobeleisen_ (plane-iron) is fixed, show that the association of ideas at once presented itself when the tool assumed the form familiar to us. The mediæval artist went further; he has logically developed the image of a rending and devouring mouth suggested by association of ideas. He has given it form; he has examined it with sufficient artistic intensity to embody materially the picture presented by the word, to raise it from the rhetorical to the plastic. But whilst the artist advanced from the mouth of the plane to a lion's jaws, and from the latter to an entire lion crouching over the board as over a victim that he has attacked and torn down, and mangling it with raging delight, he has at the same time made use of anthropomorphism, has imputed to the plane will, passion, gruesome enjoyment, and turned the planing into the tool's riotous satisfaction of bloodthirsty wild-beast instincts.

This plane in the shape of a crouching lion is the model of a good organic decoration. The construction is not injured; it does no damage to the under-surface of the plane, that it is the smooth-lying belly of the lion with drawn claws; it does not prejudice the working capacity of the iron, that it is let into a mouth of a slightly waving lip shape; it does not make it difficult to work, that the handle is shaped like a round lion's head. A sense is communicated to the tool which it did not originally possess; it does not shave and smoothe, but lives, tears, devours, and finds its joy therein. Organic decoration is thus an infusing of soul into that which possessed no soul; and not only this, but also in a higher and nobler way, a submerging of oneself in the soul that the artist has inspired into that which was soulless. He must live in the being which his anthropomorphising association of ideas has excogitated. "What should I feel, how should I act, what movements should I make, what expression should I have, if I were this object, but thinking, willing, feeling—in short, living and conscious? How should I, for instance, as a plane which was really a beast of prey, dispose myself, if I had the board—my victim—under me, and began devouring it?" The organically decorative artist is, therefore, really the dramatiser of the inanimate, for he creates beings, bestows on them character, and makes them act according to the latter and the situation, and, if not speak, nevertheless imitate.

If an artist has, from some especially vivid intuition and active association of ideas, found and embodied an anthropomorphic likeness which is very strikingly clear, imitation seizes it and repeats it with slight individual changes, which are, now and then, spirited and happy, but, for the most part, make the original picture dull, nay, through stupidity or misunderstanding may degrade it to nonsense. Such is exactly the case with the material picture as with the word-picture. At first it is the new and peculiar discovery of a poetic mind, then it is repeated well or ill so often that it ends with being a characterless commonplace. Every cultivated language is made up of such commonplaces, and, in like manner, style is made up of repetitions and tones, which are the plastic equivalent of rhetorical phrases.

The psychic sources of style—in contradistinction to those or freely devised organic decoration, which style only repeats and vulgarises—originate in very mean domains of mind. They are thoughtlessness, or, to put it more clearly and briefly, stupidity and mental inertia in their special forms as imitativeness and detestation of novelty.

It is thoughtlessness when we imitate forms that are suited to a particular material in a quite different material, simply because we are used to the sight of them. The far-famed Greek temple architecture is largely a result of this thoughtlessness: it slavishly imitates in stone the wooden architecture, the place of which it has taken; it retains the beams with projecting beam-heads and cross-braces that have neither object nor meaning in stone. To the same category belong the tablets, with manifold curled up and twisted edges, which the Renaissance and the Rococo executed in stone and wood, although they have no sense or justification except in sheet metal: the contemporary Moscow silver-work, which imitate painfully enough damask linen with Russo-Byzantine coloured embroidery, or cakes and black-bread in precious metals or enamel: the marble veils, lace garments, and knitted stockings of the North-Italian sculptors of the decadence, etc.

It is mental inertia when we mechanically persist in repeating forms which either are unfitted for a given object, or have lost all meaning. For two thousand years artists of all sorts have made a decorative use of acanthus leaves in countries where no human eye has ever had an acanthus leaf before it. The Middle Ages decorated with a whole menagerie of beasts from Asia and Africa, which they knew only from fables, foreign textures, and pictures. From imitation to imitation the outlines, which no comparison with the actual model corrected and restored to accuracy, became more inexact and grotesque. Thus arose acanthus capitals which are more like rough logs than the elegantly curled plant, and heraldic lions and leopards, in which no feature any longer reminds us of the great cats. This is then called improving upon the natural form, and people even discover a particular beauty in it: a striking proof of the ability of mankind to make a virtue out of necessity. For the so-called stylisation is conscious and intentional only in late conservative imitation. It arises, however, quite involuntarily through unintelligent imitation of a pattern that is incorrectly felt and grasped, because one has never known its living model. So, too, the whole mythology of the Greeks still haunts our present-day decoration, which mythology was to the Greek artists a part of their living feeling and religious conviction, whilst to-day it has lost all thought and feeling. What can Neptune's trident, Orpheus' lyre, the Sirens and the Centaur, the Sphynx and the Gorgon, signify to a son of this century? But whilst these bits of inherited form wander from one imitator to another, until they become hopelessly unrecognisable, they gain a beauty of another sort which they did not originally possess: the venerable spell of antiquity surrounds them, and this charm, in its turn, touches certain susceptibilities of the soul, the inclination to mystic, twilight conceptions of what is remote in time and place, the pleasurable feeling of comfortable persistance in that to which we are accustomed, the connection of the familiar and always known with the remembrance of all strong impressions, both happy and unhappy, of childhood and youth. This mystico-archaic and subjectively sentimental element, which occurs in every style handed down traditionally, furnishes it with fanatical devotees whom its original decorative value could never win. That is, if I may say so, the religious side of the feeling for, and appreciation of, style.

From the oppressive mass of material, which I must, for the most part, leave untouched, I am afraid I must deal with only one more question:—Is there a new style? Is the so-called "Secessionism" a style which characterises our time, or, perhaps, a fugitive moment of our time? He who has attentively observed the later exhibitions on this point will be bound to say "No" decisively. Household furniture and room decoration of the "secessionist" order are tortured into appearing new and original; but they are neither the one nor the other, but a patient, methodical eclecticism which aims at the influence of what is foreign and peculiar. We distinguish accurately that rooms built and painted in the secession style are patched together of Chinese motives, with an addition of Loie Fuller's serpentine twistings, and that secessionist furniture imitates, in good wood and metal, the slenderness, knottiness, and pliancy of bamboos. The secession contains a very minute percentage of independent invention and a great many reminiscences of Eastern Asia. The West European style, which should ostensibly be the expression of the latest high European tendencies, is, in reality, Chinese and Japanese style, exaggerated by absurdity of form and assumed or real delirium.

IV

THE OLD FRENCH MASTERS

We must once more change our method of study. That is the immediate result of the Exhibition of Old French artists—painters, draughtsmen, enamellers, sculptors—which, in 1904, in the Pavilion de Marsan at the Louvre, brought together several hundred fascinating, and perhaps half a dozen overpowering works. With the proofs furnished by these masterpieces full of earnestness and beauty, a chapter in the history of French and European art will have to be rewritten—not, to be sure, altogether in the sense

intended and proclaimed by those who prepared this exceedingly important arrangement.

Comparatively few mediæval French works of art have been preserved to us. The Hundred Years' War, the devastations of the League, and the Great Revolution made a clean sweep of them with fiendish thoroughness. With the châteaux, abbeys, and monasteries, their contents so far as works of art were concerned also perished. What survived has up to now appeared to a pre-conceived idea scarcely native. One historian of art wrote after another, that, up to the period of the Renaissance, the plastic artists who worked in France came partly from the Low Countries, partly from Italy, but were only quite exceptionally, if at all, Frenchmen. From a geographical standpoint, we might speak of a French mediæval art; but from the nature and form of the work, on the other hand, we should admit only a Flemish or Italian, but no French art.

This view is no longer defensible. France, too, had, in the Middle Ages, her own artists and schools of art, and if she also offered hospitality to foreign talent, she was not dependent on it. The strong, creative genius that developed in Northern France from the prosaic semi-circular arch of the Byzantine style the pointed-arch poetry of the Gothic, knew also how to make use of the chisel and paint-brush as means of expression, and to satisfy by painting and carving its impulse for depicting form. The mediæval art of France is not inferior to any other. It must no longer be treated as a mere appendage of art development in the Low Countries and Lombardy.

To be sure, if the learned compilers of the Exhibition Catalogue—George Lafenestre, Henri Bouchot, Leopold Delisle and other academicians or directors of museums and libraries—claim to have discovered, in the pictures and statues, a particular French national feature which distinguishes them clearly from other contemporary works, they are led astray by patriotic prejudice. The works bear the stamp of a period, not of a people. Nothing is more like a fourteenth- or fifteenth-century French work of art than a Flemish or Italian, and _vice versâ_. It is noticeable that people have taken Bourdichon's masterpiece, one of the gems of the collection—the portrait of the little Dauphin Charles Roland, to be a work of Memling; and of the most beautiful paintings of one and the same painter—des Moulins—have long ascribed one to Van der Goes, the other to Ghirlandajo.

No; the temperaments of the artists at this period were not differentiated nationally. They are, moreover, not so at the present day either, and if analogies are established between artists of the same origin, they may, in all cases, be naturally explained otherwise than by a common descent. The influence of strong personalities, who influence as prototypes, external successes, which form a current of fashion and incite to imitation, or simply a tenaciously held tradition of a school, in which in a long series of artist generations has grown up, suffice to impress on the art of a country through extensive epochs, a certain family physiognomy, which only a mystically inclined mind will be tempted to refer to race and blood.

Topographical and national classifications have in fact no inward spiritual justification in art, but at most a value of convenience, in so far as they render possible external groupings, which facilitate a survey. The whole art of Europe is one. It has developed from the Greek, the tradition of which has remained living through all the centuries, and has crept, from country to country, connecting inseparably all separate national developments with their common origin. The Greeks were the teachers of the Romans, and their inspirations and rules were carried down into the Christian catacombs, and from them blossomed the art of the Middle Ages.

Byzantine artists from the Roman empire of the East itself or from Italy, initiated, at the Court of Charlemagne, the barbarians of the Frankish kingdom in the mysteries of their craft, and carried the Promethean spark, however weakly it glimmered, from Attica to the banks of the Seine and Scheldt, where it did not expire, but, later on, was fanned again to bright flame by the fresh breeze of the Renaissance. The Eastern branch of Greek art withered into actual Byzantism, whose last off-shoots are the Russian icons of to-day. The Church in the East, to suit the fetish-loving views of her superstitious semi-barbarians, attributes to the picture the meaning and value of an idol, and opposes mistrustfully every deviation from the canon which, according to her conception, might weaken the power of the idol. In the West less credence was given to the picture's magical virtue, its form obtained no dogmatic consecration, the Church allowed the artist freer movement, and thus development was possible, which broke through the stiff, lifeless rule of the school, and found its way back to the inexhaustible primitive source of Greek art itself, namely, nature.

The emancipation from the Byzantine system is not the work of Cimabue and Giotto, or of an individual at all, but an effort of almost all the artists of Western Europe at the close of the thirteenth and the beginning of the fourteenth century. The portrait of John II. (1310-64) in the Exhibition, which was painted about 1359, of course _in tempera_ on a gold ground, by Girard of Orleans, is of a marvellous realism, unchecked by the slightest restraint of any studied rule. The head in profile, turned towards the left, of the melancholy-looking man in the 'fifties with the long, well-formed nose, the scanty moustache and beard, and the long hair, gleams with warm life. Girard copied his model modestly and truly, without troubling himself about a golden profit, and he could put soul

into the portrait of his king in the measure in which he himself felt the latter's inward life.

The awakening of a feeling for nature in art is generally ascribed to the Flemings, particularly to the brothers Van Eyck. That, too, is arbitrary, as a glance at the works of the old Frenchmen, who flourished contemporaneously with the Van Eycks, or even before them, teaches us. The feeling for nature was always active in the few with bright eyes and joyous consciousness of life, who dedicated themselves to art from inner impulse. The themes to which the plastic arts had for many centuries to restrict themselves were certainly as unfavourable as possible to a healthy naturalism. The only subjects the painter dared to treat were illustrations of the Old and New Testament, legends of the saints, and the symbols of faith. Scenes of heaven and hell, Biblical miracles, and personification of the dogmas of the Church could assuredly no more be painted from the model than the Holy Ghost, or transubstantiation. And yet nature herself came to her rights in this fundamental representation of the supernatural and what lay outside of nature, for she does not allow herself now to be driven out, even by the violent methods of the pitch-fork spoken of by Horace in a famous verse. Without taking particular thought about it, or with a cunning conscious of its purpose, the artists fashioned their works most foreign to actual life out of elements of reality, and achieved them by nature, truth, and life. For this reason even the earliest miniatures of the manuscripts become a trustworthy source for the history of manners. Because the art-workers of limited capacity, who wrought servilely according to the tradition of their gild, reproduced accurately all the accessories—clothes, weapons, furniture, buildings, and scenery—as they actually saw them.

The little picture, "The Virgin and Child," which is ascribed to Jean Malouel, and was painted about 1395, and can therefore have owed nothing to the Van Eycks, then in Dijon, and perhaps, too, elsewhere, certainly still quite obscure young people, is of such charming realism that one might rather class it as a _genre_ picture than as a sacred picture. The Virgin is making the Child a frock, and is just drawing the thread tight, with the needle turned in a correct horizontal direction, and the child Jesus is amusing Himself by putting His rosy little foot in His Mother's red leather slipper, of enormous size to Him, which she has taken off and placed before her. There is no reason why we should not assume that Malouel—if it was he—gave his patron—perhaps the Duke of Burgundy—his (the artist's) own dear wife and little son as a Holy Family.

In "The Death of the Virgin," of the same school of Burgundy, but about a century later, the apostle, kneeling at the foot of the death-bed and reading his prayer-book devoutly, with a big pair of spectacles on his nose, is, in spite of the pathos of the moment, so natural as to be almost comic. "The Miracle of the Saint," with his head in his hands, who is walking barefoot, by a pupil of Nicolas Froment—perhaps by the master himself—painted, about 1480, at Aix in Provence, attests the painter's most naïve indifference to probability. In the middle of the street where the decapitated saint is walking, and the executioner, leaning on his sword, stands dumbfounded, kneel, in measured symmetry, to the right and left of the saint, the founder and his consort; he with four little sons, she with four little daughters in a row, like so many organ-pipes, behind them. The picture of the city is, however, so realistic that even to-day an old corner of Aix is recognisable in it, and the gazers running up or standing in knots and laying their heads together, or hurrying to the windows, are of everlasting human verity.

Exactly the same holds good of the altar decoration, ascribed to John of Orleans (circ. 1374), a wonderful sepia painting on white silk. The sections which depict the Scourging of Christ by two brutal fellows with hang-dog faces, the Carrying of the Cross, with the Mocking of Jesus by the rabble of Jerusalem, and the Entombment, with the Blessed Virgin kissing the corpse, show that striving after truth, which has hitherto been pronounced to be a peculiarity of the Dutch. In the "Martyrdom of a Holy Bishop"—most likely by Jean Malouel (circ. 1400)—the martyr, in mitre and pallium, gazes from a strongly barred prison window, near which an angel kneels, and through the bars of which the Saviour in person administers to him the viaticum. But the castle in the Lombard style—stone rafters and corbels with red tiled spaces—on to the ground-floor of which the oval window opens, may be regarded as an architectural design.

Nicolas Froment's famous "Burning Thornbush" from Aix Cathedral (1475-6) is entirely fabulous in the middle. A soft, cloud-like, lumpy hill of rock supports a dense group of thick-stemmed trees, the tops of which unite in a kind of gigantic bird's nest, wherein the Virgin and Child sit enthroned. But this miracle, with no measure of reality to gauge it, is framed in a deep landscape with great distances; in which white towns lie by mirroring waters, and thickly-leaved trees rise up from green hills to the bright sky, and in the foreground, beside an angel of Annunciation, sits, surrounded by his drove of wethers and his quaintly posed dog, the white-bearded shepherd with his legs crossed in the most natural posture you could conceive.

In the case of almost all the paintings in the Exhibition, and chiefly of the best of them, this proposition can be repeated. The painter loyally carries out the subject commissioned, treating it faithfully according to the traditional formula; but what is not covered by the formula he shapes with sovereign freedom and an honest joyous realism which is by no means the prerogative of the Dutch and

Germans, as has been so long believed, but is to be met with, according to the evidence of this Exhibition, in the same measure in the French.

Sculpture might become crude in the earlier Middle Ages, but it did not cease to be fostered. Sculpture in stone or wood was the complement of building, that strongest expression of mediæval energy, ivory-carving, or the jewel of precious metal, the adornment of the altar or the state-rooms in the palace. Painting, on the other hand, after the collapse of the old world, went back to the adornment of books, and from this the great art of wall- and easel-painting was again developed only after the age of the Crusades. This, in many details, betrays its origin from miniature. For a long time it was nothing but an enlarged miniature. The works in the Exhibition show, at any rate up to the last third of the fifteenth century, all the features that distinguish the pictorial ornamentation of the manuscripts: the gold ground, the neat, nay, painful perfection, the gay, unqualified, almost glaring, colours, the equal clearness of objects in the furthest background and in the foreground, the puerile joy in innumerably repeated complicated decorations of the surface, the framing, with richly figured wreaths, ornamental borders, or picture margins. Even the standing formulæ of manuscript miniatures are repeated for centuries in the paintings, viz., the movements of all the personages at the Annunciation, Crucifixion, Entombment, and Ascension. Only towards the end of the fifteenth century does painting fully escape from the still clinging egg-shell of the miniature, and grow accustomed to a large, bold line, and a freedom of composition which finally reckons with considerations of distance, and prevails upon itself to neglect comparatively the subsidiary in favour of the essential. The glorious Master of Moulins has, it is clear, no longer the old inherited habit of feeling himself banished to a page in a book. He no longer shows the same somewhat mechanical respect to all work, principal and accessory. In the “Virgin and Child between the Founders,” and particularly in the “Nativity” with the twilight landscape in the background, and the fat poodle in front sitting on the kneeling cardinal’s mantle, the precedence of values is observed, and the painter reserves his piety and devotion for the noble parts.

The author of these pictures—one of the greatest painters that ever lived—is only known as the Master of Moulins, or the Painter of the Bourbons. His name was probably Jean Perréal, but there is no certainty about it. Only a few definite names have come down to us from the beginnings of modern art. We must search for them in the inventories and account books of princely households or cathedral chapters. The artists did not yet sign their works; they indulged in no dreams of immortality. They did not yet feel they were the supermen, that the Renaissance, later on, made of them, and that, in the estimation of the upper class, especially of its feminine and effeminate portion, they have remained till the present day. They were honest and genuine artisans, just like other respectable artisans; and in France they, for the most part, enrolled themselves in the Saddlers’ Guild, perhaps because they, like the latter, had originally, as miniature painters, to do with parchment, _i.e._, a species of leather. They regarded it as a special distinction to be appointed servant,—_valet_ or _varlet_—of a prince, on whose commissions for church and palace they lived. Jean Malouel and his pupils, Jacques Cone and Jean Mignot, Jehan Fouquet, his sons Jean and François, and his great pupil Jean Bourdichon, Enguerrand Charonton and Nicolas Froment, perhaps also Perréal and King René the Good (1409-80), are perhaps the only painters whose personality stands out clearly outlined in the dawn of art history before Clouet, and his contemporary Corneille of Lyons. Perhaps a number of forgotten names may yet be dug up from archives. The obscurity of the few who have either been handed down to us, or been rescued from oblivion by industrious investigators in recent years is a heavy injustice. They deserve to shine with the same glory as the most illustrious that Vasari has preserved for us in a work of amusing studio gossip.

Jehan Fouquet stands in a line with the greatest portrait painters of all times. He may be named in the same breath with Holbein—nay, with Velasquez. His portrait of a man in the Liechtenstein Gallery at Vienna, which shone as one of the gems of the exhibition, is perhaps the most powerful work that the great master created, and the “Man with the Wine-glass,” in the Vienna collection of Count Wilczek, is hardly inferior to it in significance.

Of the numerous suggestions of an artistic, moral, and psychological nature that were the outcome of this unique exhibition, the deepest and most abiding—at least for me—was that one felt the spiritual condition of the artists who created these works on commission and, for the most part, according to precise instructions from princes and prelates, lords and governments of cities. In nearly every one of them is played the great drama of the struggle of souls thirsting for freedom with the fearful oppression of intellect of the darkest Middle Ages. Secret corners and angles, easily overlooked backgrounds of the pictures, suggest already the future art, untrammelled by the world, which will overcome this art of the guilds, with its fixed, dogmatic formulæ. A Fouquet, a Bourdichon, a Clouet who, in kings and princes sees, and paints with horrible realism, poor, sick, ugly, dull fools, stands no longer under the control of royalty. He is inwardly a disrespectful rebel, and is, in his way, a prelude to the procession of the market-women to Versailles, which, two or three centuries later, was destined to overthrow the kingdom. A master of the “Mount Calvary” (1460), who makes the holy women and disciples stare with such unmoved, wooden countenances at the Body of Christ,

not because he is incapable of painting sorrow-stricken faces—all the details of the painting witness to his artistic power—but because he contemplates the incident with coldness of heart, and expresses his unbelief to the initiate as plainly as the rack and stake of the period allowed. In these early works there is a very soft and very weak rumble of thunder of a very far-off storm. They are a first indistinct announcement of the Revolutions that are slowly preparing.

V

A CENTURY OF FRENCH ART

Sincerity did not rule in all parts of the Paris Universal Exhibition of 1900, but a quickening air of freedom was breathed in the great palace of art. The temporary proprietors of this colossal building, the French artists, did not pretend to any motive that they did not possess. “Make room! Out of the way! Out!” we fancied we heard from all the dusky corners of the vast halls in a voice of thunder. “Foreigners from both worlds? To the south wing with them! In the corner! Under the staircase! That’s quite too good for them. The dead? The famous of yesterday? What do the disturbers want? Haven’t they had their share of ribbons, titles, commissions from the State, and other forms of the artist’s ideals? Back with you! To the furthermost building in the rear! If any one wants to make journeys of discovery, he can steer away. The chief buildings, the foregrounds, the splendid halls for us, the _chers maîtres_ of to-day. We are the strongest, therefore we need do no violence to our feelings. We are alive, therefore we are right.”

Certainly, certainly. I do not contradict this; but it suits my inclination to wander past the conquerors of the day to the shadows in the back premises, into the remote and also, as to equipment, significantly neglected halls of the Century Exhibition, to the great vault in which is collected that which was to make plain the development of French art from the Revolution to Carnot, the grandson. What remains when the human being who gives dinners, haunts antechambers, has cousins in the Ministry of the Fine Arts, whispers malice in one’s ear, ceases to acknowledge greetings, and writes flattering letters, has fallen to dust; when rivals and parasites have disappeared; when the puffs of toadies, and the no less valuable ones of envious men and poison-boilers, are hushed and forgotten?

Not much, and there lies the melancholy humour of such wanderings through the realm of shadows. The only feature that always wounded me somewhat in the “Divine Comedy,” is that Dante awards his curses and execrations on the departed according to the rank they occupied among the living. The invectives on the poor soul of a pope have three stripes, those on a prince, two, and on a lord, one. That is an inartistic forgetfulness of the frame chosen by Dante for his poem. If he remained always mindful of his programme of death and hell, he would not be able to distinguish crowns or purple mantles in the red illumination of the under-world. The laughing and sighing philosophy of Hamlet—alas, poor Yorick!—stands higher than the resentful fury of the passionate Italian, who makes the hierarchy overstep the threshold of the grave. It is perhaps the most profound usage of the French language that they deprive the dead of the “Monsieur,” to which every living man, with the exception of those criminally prosecuted and condemned, has a claim. The dead has no longer a title—so much more sorry a fate for him, if, when he was alive, he was nothing more than a title.

The practice is even here somewhat different from the pure theory. The deceased is no longer “Excellency,” “Professor,” not even “Mr.” But the usage of contemporaries to give him a title is still expressed in the respectful tone in which they pronounce his now naked name, and in which one possessed with a delicate sense of hearing perceives the rustle of all the tinsel that surrounded him when alive. In this tone, however, the name becomes familiar to the younger ones, who, without thinking, continue this veneration, unconscious that their accent expresses respect because the bearer of the name so pronounced was once a Grand Officer of the Legion of Honour and an Academician. Thus, my dear Schiller, are your confident words to be understood, you who would never perceive the weft of vulgarity in the ways of man: “He who has satisfied the best men of his time has lived for all time.” Certainly, if by “best” we would understand the best placed, best paid, invested with the best office, or the best decorated. He who during his lifetime has belonged to those favoured by the grace of official newspapers, who has been gauged by them and provided with a “full” mark, will be recognised for all time as full without further test. The Pantheon is the continuation of the minister’s official rooms, the golden book of spiritual history an anthology from the Official Gazette and the Army List, for the use of the children of later centuries. If I must emphasise the essential: the appraisement even of the artist, therefore of the most individual man that exists, is the outcome of social, not individual, factors, or of the latter only when they are socially successful, and, therefore, themselves become social factors. There are, I admit, always proud—perhaps only haughty—natures with an anarchistic, anti-social trait, who will not recognise any arrangement or fixing of the community, not even its hierarchy of fame, and clench their fists against laurel crowns just as they do against crowns. Their rebellion, however, is seldom successful. I know of no case of a bomb-thrower having

destroyed a Pantheon.

But as we do not take ourselves tragically, do not begin our own verdict with the threatening formula, “In the name of the Law,” and do not exact any submission from others, we are always entitled to be of our own opinion, and to let the dead influence us without prejudice, untroubled by the distinctions of rank which were bestowed on them in life, and were buried with them. Such a method of observation is unhistorical, but subjectively fruitful; it leads to self-emancipation from many superstitions.

The Century Exhibition of French painting was far from being complete; it was incomparably more fragmentary than the Louvre Museum, which is also not without gaps. But it afforded a general view of the art development of the period represented, and it gave the independent man the chance of correcting numerous opinions which had taken hold of him from study and reading.

It began with the masters who created and flourished before the deluge of 1789—Watteau, Greuze, Fragonard, Vigée-Lebrun. The three first had, for two generations, sunk deeply in general estimation. Then the force of fashion raised them up again to dizzy heights of fame. I do not believe that they will maintain themselves there. It pleases the reactionaries to glorify the _ancien régime_ at the expense of the Revolution, and to this planned and deliberate toil belongs also the unmeasured overestimate of eighteenth century art and artistic work. But it is politics, not æsthetics—no taste for art, but a tendency. In reality, the darlings of the age of the Pompadour and Louis XVI. were petty masters, mere fillings of a particular frame, and, lifted out of this, they lose their best qualities.

Watteau still holds his ground most easily, for he is an amiable teller of stories that are agreeable if nothing of a more serious character occupies one’s mind. He draws elegantly, although without pedantry; his colouring is cheerful, and suits admirably his hushed, silken carpets, coquettish Gobelins, and light lacquered furniture. He is the painter of joyous days wherein life seems an eternal feast. Gracious spring bedecks the earth, his men and women are all young and handsome, his ladies wear entrancing toilettes and _coiffures_, and his gentlemen silk doublets and lace shirt-frills. Even if they dress as shepherds, they are laughingly addressed thus: “I know you, fair masque; you are a marquis in disguise with your charming friend, the duchess.” Rosy angels hover about them, and mingle familiarly in their pastimes. They have nothing on earth to do except pay each other witty compliments and play at love. I understand why American multi-millionaires pay any price to be surrounded by Watteaus. It is really honourable to the artists of our time that the Trust magnates have not yet succeeded in finding or rearing painters who would flatter their egotism through servile suggestions of a Watteau aspect of the world.

Fragonard appears in a secondary position besides Watteau. He is drier, and with less “swing.” He is not really present in his heart at the pastimes he paints. Watteau is himself a guest at his festivals; Fragonard takes part in the _soirées_ only under a sealed order. The former amuses himself, the latter amuses the person who gives him the commission.

Greuze lives on the fame bestowed on him by the grateful Diderot. He was enthusiastic for Diderot’s tearful _bourgeois_ tragedy, and Diderot repaid him with enthusiasm for his painting; but we have no longer any grounds, I suppose, for regarding him with Diderot’s eyes. When he paints his eternal model of the “Broken Pitcher” in the Louvre, and of his sundry counterparts of it in the Century Exhibition, he is pitilessly pretty. When he sets great dramatic scenes in the Diderot style on the stage—the “Village Betrothal,” the “Father’s Curse,” etc.—he is depressingly melodramatic. His young maiden is marvellously pretty and tame, and will always delight childlike spectators with the charm of her blooming girlhood. He suffered himself to be infected in Italy by Guido Reni’s sweetness, and only transplanted his soft beauties, rolling their eyes, from paradise to the middle-class earth. He is simply the Bouguereau of his age. That name comprises all that can be said of him in praise or blame. Greuze is Bouguereau’s superior in so far as he paints more vigorously, and forms his pretty _ingénues_ of real flesh—not, like Bouguereau, of alabaster and sugar-candy.

Beside the softness of Greuze, Madame Vigée-Lebrun seems a man and a fighter. In a century of gallantry she alone was not gallant. She painted women’s likenesses, and did not pay court to her models; but she elevated them, and gave them meaning. Where the male painters of the period saw only beauty-patches, she suspected she saw a soul. If we look at these women with curiously poised heads, gazing boldly out of their frames, they say proudly and calmly: “I am no trying-on hand; I am no creature of luxury; I am no flesh for lust; I am a personage.” At a distance of a hundred years Vigée-Lebrun is a forerunner of the now innumerable American painters of emancipated womanhood. This brave woman, who was beautiful, and did not overprize, nay, hardly prized her beauty, was an asserter of women’s rights long before the word or the thing was invented.

Prudhon was represented by a “Zephyr,” which has the same peculiarities as his “Crucifixion” and “Crime and Punishment” in the Louvre. He models a human body so that one must take one’s hat off to it. He has the infallible feeling of the great Spaniards for the

value of light and shade; but what will always stand in the way of his being loved and not merely respected is his hatred of colour. He confines himself to a strict black and white style, which banishes all gladness and discourages the most willing admiration.

And now the great deluge breaks in, and, like a sea-god David emerges over the raging waves. It is really with him that the century begins, for what preceded him was the art of the _ancien régime_ and of the Trianon. He had at the Exhibition a “Distribution of the Colours,” an “Ugolino,” some portraits; all of the most genuine David in choice of subject as well as treatment. Everywhere the capricious “seeing yellow” which seems to have been a peculiarity of his eye; everywhere the grandly imposing, professorial infallibility of drawing which knows no first trying, no anxious searching, no hot struggle with the never quite attainable Nature. David compels with an imperious Medusa-glance the ever-stirring, the ever-flowing, so that it becomes fixed, and he can shackle the now immovable vision in brazen outlines. So his human beings appear statues, or mimes, which maintain a pose, and his most blameless anatomies acquire a tendency towards the artificial. David’s mood is always uniformly high-pitched. Good-humoured people, who would like to see the majestic man in shirt sleeves for once, lurk in vain for him to unbutton himself. He never forsakes the decoration and costume of high tragedy. At first he sought the drama in ancient history or world-famed poetry. Afterwards, he found it in his immediate surroundings. Fate vouchsafed him the favour of living in a time, the pathos of which was mightier than that of Athens, Sparta, or Rome. He satisfied his deepest longings when, in the “Sabine Women,” he preached to the murderous factions among his people reconciliation and brotherly love, and, in “The Distribution of the Colours” and the “Coronation,” he made Napoleon the equal of the heroes of mythology. He is, therefore, always genuine, even when he may seem to the superficial gaze theatrical. It is the difference between a tone naturally sustained during moments of life at high pressure, and declamation learnt from a teacher of rhetoric.

His pupils, imitators, and rivals have, on the contrary, not succeeded in avoiding declamation. Gérard, Gros, Riesener, and Drolling were, consciously or unconsciously, the greatest flatterers that ever painted portraits. Because David represented Napoleon in the character of an Alexander of Macedon, or an ancient god of war, the others, the smaller painters, in their portraits gave to even the ordinary men of the period the deportment of Olympian gods. Only Gérard’s “Letitia,” who, too, bore apotheosis most easily, is a good modest human being. All the other women are Juno or Pallas Athene; all the men Mars or Achilles. The contrast between the commonplace physiognomies and the magnificence of their appearance is now and then so violent that one is led to surmise that the painter wanted to make fun of his models. “Charles X. in his Coronation Robes,” by Ingres, seems, for example, virtually a parody of David’s “Coronation of Napoleon.”

Géricault stands an examination of his title to fame badly. He has not so correct an eye for the figures of horses as was believed before instantaneous photographs. His portraits of soldiers are really more crude than powerful. Even the sketch for the “Raft of the Medusa,” reveals evidence of straining after effect which our pious admiration refused to notice in the colossal work in the Louvre. On the other hand, the figure of Louis Leopold Boilly gained strangely in the Century Exhibition. Up till then I knew only his “Arrival of a Diligence at a Posting-house,” in the Louvre, and I did not rate him very highly on account of the affected _atelier_ light of this otherwise prettily studied little picture. Here he disclosed himself as a great philosopher and satirist. One picture represents a popular merry-making with wine _gratis_, another a free performance at the Ambigu-Comique Theatre. There the crowd is fighting murderously over a drink that can be had for nothing; half-grown hobbledehoys throttle bestial greybeards; bullies claw hold of furies; dreadful feet trample on faces and necks in the mad storming of the wine supplies, and the victors in this struggle have their reward: they lie on the ground bestially drunk. The scenes at the entrance of the theatre are not quite so vulgar. There is a less dogged scramble for intellectual enjoyment than for that of the palate. Yet here, too, the most brutal lack of consideration and greedy selfishness triumph; here, too, the strong man overmasters the weak; here, too, among beings who seem to belie their human form, the law of the jungle holds good; and here, too, poor people pay for a little doubtful pleasure with the sufferings, dangers, and exertions of a storming of the Malakoff. In the foreground of both pictures stands a group of well-dressed persons who, half in pity, half in disgust, look at the disorderly pushing of the rabble from a respectful distance. These rich people have the _rôle_ of teaching the moral of the fable. They express the sociological thought of the painter. Boilly deplores the low moral condition of the masses, and reproaches the dominant class with having degraded them to beasts, when it pretends to give them a feast. He rejects with utter disdain the dogma of equality, yet without haughtiness, for he has for the disinherited the somewhat condescending, yet warm pity of a genuine patrician. These are extremely modern—I might call them Toynbee-feelings—and they are expressed with an exact, judicious brush that can conjure forth the confused turmoil of a great, raging multitude, and, nevertheless, remain faithful in all details. Boilly was decidedly a master.

The Century Exhibition also gave the opportunity for a discovery, not only to me, but also to all who brought to it an open mind. There is a painter, Trutat, of whom no one had ever heard anything. Seekers who investigated the provincial newspaper of 1840-60

succeeded in discovering one or two articles about him. That is all. He once or twice exhibited in the “Salon,” but the “Salon” reports of the time make no mention of him. He lived in the first half of the last century, and died at the age of twenty-four. Before his picture—one single picture—men were amazed, and women stood with moist eyes. It is a double picture; in the foreground, a fair young man, pale with sickness, with deep blue eyes and a proud, wild mane; his firm forehead full of impatient dreams of joyous creations, fame, and happiness, yet, in his hollow cheeks, faint shadows of death. Behind him, half obscured in dusk, a woman’s profile, his mother’s head; a good Samaritan with tender gaze, and lips closed in sadness, which once sang cradle-songs, but have learnt silence in the sick-room. In its composition there is a reminiscence of Ary Scheffer’s “St Augustin and St Monica,” in the Louvre. But it is incomparably more profound, for Trutat depicts himself, not saints whom the power of imagination has first to bring before him. The painting is wonderful, firm and full as that of Franz Hals—I deliberately utter this strong statement—so surely and organically matured that one traces beneath the skin all the most delicate muscles and bones. And add to this technique, of which one does not discern how he could have acquired it in a fleeting morning of life, the intensity of feeling which has raised the work to the rank of those high creations in which a soul is revealed. The picture is full as a swan’s song, of foreboding and love. The great youth does not understand himself alone, without his mother—the dear mother must be with him, if he goes out to the market among people. Shall she nurse him? Shall she protect him? Can he dispense with her for a moment as he must be taken away from her so soon? All this is in that mysterious picture, and it was in it when Trutat, though he did not know it, painted his own requiem. Only nobody then understood the riddle; Trutat as little as the rest. He is another Regnault, only a still more genuine one. And no one has made lamentation about him, although his tragedy is more painful than Regnault’s. For the latter attained immortality in the apotheosis of death in battle, whilst miserable consumption slew Trutat ingloriously.

The Romantic fever begins to seize the century. The painters hasten to hang round them the botanical box, and seek the blue flower. The first to go forth into the moon-illumined, witching night was Chassériau! Poor Chassériau! It would have better suited his bent to paint _salons_ with rich Empire-furniture, wherein respectably dressed citizens sit with their wives and daughters, and pleasantly tell each other the anecdotes of the day. His portrait of the two sisters in red shawls and yellow plaited dresses shows this—a neat, pretty, _bourgeois_ painting, which denies itself all enthusiasm, and all soaring. But now the tarantula stings him, and he occupies himself only with obsolete subjects such as Orpheus, _châtelaines_, fairy-tale princesses with black slaves, Macbeth and the three witches. The last picture is particularly characteristic of him. The three witches have their white beards and pointed noses, as prescribed by the romantic code; but they are merely grotesque, but not in the least weird. We have the impression that they have met in a peaceful country in order to gossip about their neighbours, and make coffee. They publicly proffer the knight, who should be Macbeth, a small bowl. The heath by night lacks every trace of mood; the ugly old women every touch of the demoniac. Chassériau painted, just as J. Fr. Kind—the [“Freischütz”] Kind—wrote poetry.

I am afraid I must likewise be guilty of heresy in respect of another great man; but Delacroix, too, fails to justify the idolatry people have displayed and, to some extent, still display towards him. I do not misjudge his joyous coloriture, although his harmonies are rather loud than grand. I am not blind to the characteristic mobility of his composition, although it is generally far more a stagey flourish than assertion of strength in the service of a will conscious of what it is aiming at. What excites in me, however, unconquerable opposition is his phrasing. If any art demands intuition it is painting. Delacroix, however, usually has not exercised intuition, but has clothed with the cool work of his brain abstract thoughts in conventional forms. For this, look at “Greece expiring on the Ruins of Missalonghi”—a picture which was once of enormous influence and highly praised. On some disordered masonry stands a young lady in the _bal masqué_ dress of a Greek, who has no thought of giving up the ghost, but is playing a part in robust health, and will change her dress, and have supper later. At some distance behind her we catch sight of a young negro in the uniform of a Janissary, climbing a rubbish heap, brandishing a flag with a crescent on it, and a curved sabre. This slightly painted Turkish warrior appears not to see the young Greek girl; at all events he does nothing to her, and does not even threaten her. There is no association between the two figures; the action is disconnected. At most the Turk is interesting as an acrobat or banner-swinger. No murderous propensities are noticeable in him. The countenance of the Greek lady is pale and weary; but a rest in bed seems the only thing she needs. It says much for the keenness of their Philhellenism that this picture could move the people of the period. Delacroix had, however, no intuition at all when he painted it; he only illustrated an unplastic, insipid phrase.

His other paintings are mostly illustrations of a text. “Comedians and Buffoons” were unmistakably suggested by Victor Hugo. Confused ideas occur to him. Thus “The Good Samaritan” was not painted to the passage in the Gospel, but to a story of chivalry; for the gentle benefactor takes the sick man on his charger—he is a mounted Samaritan!—just as a knight takes the noble lady he is carrying off.

Delacroix was a literary painter; we know that from his correspondence; but without that, his pictures would betray it. He read much more in books than in nature, and he supplied paintings that gave evidence of education and much reading, in which the art-hating, blind-souled Philistines of education delight royally. It may be that the confusion of his portrayal and the loudness of his palette was felt by his contemporaries as a deliverance from the coldness and precision of David's school. I suspect, however, his earliest admirers valued him chiefly because he fed on the same books, plays, and newspapers as themselves.

Ary Scheffer stands in the same spiritual plane as Delacroix, but lacks the keenly joyous colour and the theatricality of his stage-setting. Schubert's songs and Schumann's are music even without the lyric text, and what music! I cannot imagine what Ary Scheffer's pictures from Shakespeare, Goethe, and Byron would be without the poets and their poems. His picture in the Century Exhibition, "The Dead ride fast," is, if I exclude from my conception my remembrance of Bürger's ballad, an almost touching example of tastelessness. Leonora's dishevelled hair, blown by the wind into a stiff, horizontal position, is supposed, for instance, to illustrate the swiftness of the ride—a notion which may have seemed to Scheffer terrible, but is comic.

Horace Vernet had a "Mazeppa," of course a big modern battle, and several likenesses. He is as popular as on the first day, and will always remain so as long as children play with tin soldiers and the picture sheets of Epinal—the French Neu-Ruppin—find a ready sale. How he dazzles! He does so to a degree which deserves admiration. From a distance his pictures appear to be something; one must look at them quite closely to see that they are nothing, absolutely nothing. The colossal canvas is apparently full of men: thousands of soldiers march, encamp, storm, fight; but, as a matter of fact, not a single figure is painted; the whole pomp of war and victory is composed of little stencilled gingerbread men, without any bones in their bodies, and with scarcely the remotest resemblance to human beings. Could Horace Vernet draw? Had he really any other conception of the human form than that of an inflated india-rubber figure? In Paris and Versailles I have seen many paintings by him, but I cannot yet answer these questions. Horace Vernet is the fourth of a dynasty of painters: the first, Antoine, was great at little figures on sedan-chair panels; the second, Joseph, painted the well-known series of French harbours; the third, Carle, is a master in depicting horses; Horace, the fourth, is the weakest of them all, incomparably inferior in ability to his father, grandfather, and great-grandfather. He alone, however, has attained fame, and his renown throws his ancestors into the shade. The wheel of fortune now and then plays immoral jokes of this sort, perhaps in order to teach its own futility.

Daumier was known to me and, I suppose, most people, only as a draughtsman. We learnt now to prize him as a painter of high rank. His numerous paintings are illustrations to "Don Quixote," romantic merry-Andrews, street-singers, Molière's _Malade Imaginaire_, and a crowded group of lawyers in cap and gown. His manner is the same in oil as in lead-pencil and crayon-drawing: his lines of movement broad and firm, the outlines blunted, and now and again rubbed; all his figures mysteriously surrounded in mist, yet all so clearly and faultlessly represented that one is never led to suspect that their mysteriousness is a trick to hide carelessness or lack of skill. Even his oil-painting is really caricature, but discreet caricature. The nobler method instils into him self-respect, and preserves him from caricature; he just marks roguishly the burlesque features, but does not diverge from reality. Thus his lawyers are portraits, but they look so maliciously intelligent, so inexorably penetrating, that we can doubt of this or that head whether it is a likeness or a caricature. Let us say this: the model will take it for a caricature, but his friends will regard it as a portrait. Daumier is a solitary; he is akin to none of his contemporaries, yet an example of the migration of souls; for in him Hogarth comes to life again, but a Hogarth who for his part would be animated by a spark of Rembrandt's spirit.

Suddenly another solitary appears in the ranks of the allied men of school and tradition, viz., Millet. Precipitation would infer: the romantic is overcome; a new generation with new modes of feeling arises; the nerves of the century begin to vibrate according to a new rhythm. That is sheer nonsense; nothing has been overcome. The romantic masters still form romantic pupils, the crowd still feels in the traditional way; the range of themes and the fashion of treating them remain what they have been for a generation, but amidst the dependent, the docile ones, the imitator forms for himself, by the law of elective affinity, a divergent group—the group of the forest-folk of Barbizon—and amidst this group steps forth an individual man who forgets the master's _atelier_, who, in painting, thinks of neither the _salon_ nor the art-dealers, who looks not into books and newspapers nor on prototypes, but out into the world, and on that account falls completely out of the century.

If we follow up the development of art in the Exhibition, we may easily fall into the error of thinking that with Millet one epoch closes and another begins. Such was not the case in reality. The contemporaries who appreciated Millet were a diminishing few. Official art despised him. There were no distinctions for him on the part of the State. The critical phrase-makers knew nothing of him or mocked him horribly. The rich connoisseurs passed him by. A very small congregation of moderately well-off admirers, whose valuation appraised their most honest admiration at 1,000 francs at most, bought his pictures at prices which just made it possible for him to live in Barbizon in wooden shoes and a blouse, and to bring up his numerous family on potatoes and bacon. But as he

was a personality he succeeded—though only after his death. He made a school, like every one who has something to teach. He gained influence on the views of the creators, the critics, and the public. People began to understand his speech, nay, to feel that what he said was beautiful. But to this day there is no Millet epoch in French art, and his fame is really an optical delusion. His works did not bring him into the mouth of the masses, but the caprice of a millionaire. On the day when it occurred to M. Chauchard to pay 600,000 francs for Millet's "Angelus," snobs of both worlds took off their hats and murmured in a voice hushed with reverence: "That must be a great painter." As we see, the world's fame is but a question of money. Many more men are able to reckon than are able to feel the beauty of art, and, to the vast majority, its price is the infallible, the one key to the understanding of a work.

I must say that the millionaire who acted as Millet's herald of fame, had no sense of proportion. If the work of an artist is to be measured by a gauge, the figures of which represent gold coins, Millet does not reach the altitude of 600,000 francs, unless we estimate at least thirty of his contemporaries equally high. In technique, Millet follows the Dutch; a David Teniers without humour and without aim at humour. His landscape, never the essential with him, is poorer than that of Rousseau and François, not to speak of Corot. His greatness lies in his personality, in his simplicity, in his avoidance of pose, in the pious earnestness with which he follows the daily toil of the field labourer. That is no new note in art, but it is the manifestation of an individuality. Many are his superiors purely as painters. But souls cannot be compared and measured: they are incommensurable.

Courbet follows on Millet. Those mad on systematising have classed the two together as pioneers of Naturalism. What blindness to the essential! If anything does connect them—according to the Hegelian method—it is their very antithesis. Millet—let us think of the "Man with the Mattock," "The Gleaners," even "The Pig-Killing," and the two pictures in the Century Exhibition: the field-labourer, who, his day's work ended, is putting on his coat, and the mother feeding her little child with pap, as well as "The Angelus"—Millet indicates, in heavy painting and little-pleasing colours, in people whose coarse externals do not attract a spirituality that ennobles them and makes us forget their soil-stained smock-frocks and their hard features. Courbet, on the other hand, draws faultlessly, and is master of every knack of the trade; but, with his rich means, he never gets above the spiritual stage of photography, and he knows not how to open to us the smallest corner of the moral and spiritual being of his men and women.

But, strangely enough, this same Courbet, who never conceives human beings except as soulless forms, can put a soul into nature and her lower-conditioned life. His justly famed "Sea-Waves" breathes a dramatic will-power. His "Roes in the Wood" are spirited. Ancient, mysterious wisdom appears to possess even his trees. Animals and plants, sea and land, speak in Courbet; man alone is dumb. He is a pantheist who excludes only man from the All-Divine. That is pessimism rooted in the most profound unconsciousness, which hints at serious organic disturbance.

Rosa Bonheur, represented by a wonderful "Team of Oxen before a Hay Waggon," is in this respect akin to Courbet. She, too, is an eloquent advocate of the beauty and profound feeling of the brute; but, more logical than Courbet, she confines herself to representing animals, and does not meddle with human beings. Man fails to interest her; she takes no heed of his indifferent appearance. The animal alone attracts her attention. A Rudyard Kipling of the brush, she has painted all her life the "Jungle-Book," that tells of the wise and good and honest beasts, and the cunning men. Sir Edwin Landseer was also an animal-painter, but of quite another sort than Rosa Bonheur. When Landseer wanted to flatter the beasts, he gave them human qualities. Rosa Bonheur would have felt she was insulting her dear animals, if she had painted a picture like the "Diogenes" in the National Gallery in London. The humanising of animals seems to her like degrading their special animal beauty. Her love of animals was morbid; it was, however, a deep and powerful emotion that made of her a great artist.

Our wandering through the Century Exhibition led us finally past the great landscape-men, the founders of modern landscape-painting, to Manet and Monet, Renoir and Degas, with whom a new century of art begins. In a later section on the Caillebotte room in the Luxembourg Museum, I shall study closely the authors of the Open Air Movement. The fight against the children of classicism and romance was furious, and "free-light" was victorious in the degree in which it deserved victory. But even in those days of turmoil there were idyllists who remained undisturbed by the tumult, and did not notice it. Gustave Moreau painted his colour stories from a palette of gold and precious stones, from a palette of Limosin and the glass-painters of Gothic cathedrals, as if there had never existed an "Olympia" of Manet or a "Funeral Procession of Ornans," of Courbet. The high importance of Moreau, to whom I return in a special study, lies in the fact that he teaches us the feebleness of all classification of art development into epochs. True artists are not subject to time, and move side by side without influencing reciprocally their orbits. They are not subject to Newton's law of gravitation.

The Century Exhibition taught us something more. It sharpened our sight for distinguishing between the literary painters and the painters proper. The former, as a rule, find fame quicker than the latter, but their fame affects posterity as a bad jest. They are illustrators of the time, and what it brings, that is the worthless, art-destroying “actuality.” Every attempt to put painting at the service of contemporary thought, to demand of it philosophical collaboration in the development of political, moral, and social doctrines, is a sin against an art whose essence directs it to the eternal aspects of the phenomenal world. Only those are genuine painter temperaments which can follow reflectively the play of light on surfaces in motion, and tell us what feelings this play awakens in them. All symbolism, all allegory, all graphic accompaniment of poetry, is weak. Only what has been really seen has permanence, even if it is reproduced with little skill. You cannot paint from hearsay, only from the impressions which the eye takes in, and the soul delivers. It is astonishing that so primitive a biological truth should be so difficult to grasp.

VI

THE SCHOOL OF 1830

Thomy Thiéry was a rich man of the formerly French, but afterwards English, island of Mauritius, who lived and died in Paris, and left his art collection, consisting of paintings, Barye bronzes, and some Gobelins, to the Louvre. Thomy Thiéry was a man of a single passion and a single thought; he loved only the Barbizon School and some of its artistic contemporaries who, in his opinion, stood in an elective affinity to it; but he loved them with unshaken fidelity and constant self-sacrifice. And in contrast to other more eclectic amateurs, he did not perform his heroic deeds of an undaunted purchaser in auction rooms and art-shops, but carried his money to the studios of the living and struggling as long as he was able, and appeared on the market as an ordinary collector only when the brush had slipped from the hand of the creators. In this way his gallery got the warmth and unity of an organic being, and besides its beauty, gave joy through the idea that it was not the result of _parvenu_ vanity, or of that cruel fancy that takes satisfaction in a work without troubling about the originator, but that a grateful patronage, which not only wishes to purchase art treasures, but also to lighten and beautify the artist’s earthly pilgrimage, had created it. As a legacy to the Louvre, the collection has from a fraction become an integral section that methodically dovetails into its place in the frame of this incomparable museum, in which the history of art is made to live before our gaze in select examples. The management has added the pictures which it formerly possessed of Thomy Thiéry’s favourites, so that the three halls of the collection now afford a good survey of the fruitful movement, which, about 1830, took place in French painting, and diverted it from the degraded classicism then dominant into the path pursued at present.

The School of Barbizon! A convenient, but, for that very reason, a meaningless, expression. The men comprised in this commonplace designation have not much in common. In age not far apart, they were bound to each other by personal friendship, and partly inhabitants of that Fontainebleau wood, in which some of them experienced Nature’s revelation. They were, however, very different in temperament, genius, and impulse, and they strove for personal ideals with dissimilar modes of expression. Only one peculiarity belongs in like degree to all, viz., the burning longing with which they yearned to get out of the stupid hole-in-the-wall of the academic studio that had become to them a goal into freedom and life.

Without punning, the free air and freedom meant to them the same thing. Landscape furnished them with the means of renewing their acquaintance with Nature. Under a completely Faust-like impulse, they struggled out of the _atelier_, where, “in reek and decay, only the skeletons of brutes and dead men’s bones” surrounded them, “into the far country.” Their appearance about the time of the July Revolution was the Easter-morning walk after brooding in the Gothic studio.

The David tradition held painting in thrall. The master’s greatest pupil, Baron Gros, and, with him, the gifted Géricault, sought to overcome the stiff mummifiedness and dryness of forms, the staginess of subject of this art, which found its triumph in the “Rape of the Sabine Women” and the “Coronation at Notre Dame.” But Géricault, misjudged and undervalued, died early a conquered man, and Gros, going astray in uncertain sounding of himself, returned, after his short revolt, to the tin and paste formulary of his first epoch, recognised in alarm its hollowness, and, by voluntary death in the Seine, got rid of the pains of the sceptic who has lost his faith and his ideal. The then young generation, warned and shaken by the tragedy of this seeker who found nothing, broke with the dominant rule, and sat down at the feet of Nature, to learn from her.

The country is the great master-workshop. There Nature speaks her most eloquent language of form. There she finds the tones that awaken the loudest echo in the soul of the genuine born painter. The creation of a pictorial artist is, like each of the higher mental activities, very complicated; the most opposed organs of the brain have a variously graded and mixed share in it. The vivid reception and rendition of a phenomenon at rest, of the expressive line of one in motion, is an exercise of the motor centres. In the

representation of man, or what pertains to man, which is, directly or indirectly, through the awakening of anthropomorphic ideas, to seize on our minds, trains of thought, reason, and judgment play a part by the side of the emotions growing out of the unconscious. But the real and essential element in painting is neither the motorial production of the drawing, nor the travail of thought in the composition, but is ever the giving of light and colour. Now what counts in landscape is the effect of light and colour. Here the painter stands before the magic changes of lights and the alluring colour-mysteries of Nature, which excite him most keenly; for they stimulate his optical centre, of which the extraordinary development and particular susceptibility of light is the psycho-physical basis and preliminary condition of the primitive, impulsive gift of painting. Ever when men of talent feel the stiffened traditions of the schools to be intolerable, and want to follow their own inward impulse, they flee to the country in order, in its free light, to wash themselves clean from the dust of the schools, and bathe into health their limbs, aching from constrained positions. There is profound instruction in the fact that to Giotto, in his effort completely to burst the fetters of Byzantinism, which his master, Cimabue, had already strongly shaken, it first occurred to introduce into his work the elements of landscape. His picture in the Louvre of St Francis of Assisi is a touchingly _naïve_ example of this.

It was Corot who first uttered in the French painting of the nineteenth century the creative words, “Let there be light.” Of course, he did not discover day, for there were masters before him in whose pictures the sun shone. We find in Ruysdael the keen, chilly clearness of a northern sky. Claude Lorrain gives warm, tender evening tones of the south, which have the effect of luxurious warm baths. From him, Turner directly traces his descent, who overheats Claude’s pleasant tepidity to a glow, and raises his gentle clearness to a blinding splendour of radiancy. But no one before Corot has understood, like him, how to fill pictures with such discreet yet penetrating, delicate yet glowing light. It is no melodramatic, no Bengal or concocted light, no light of strange, exceptional occasions, of confusing colours, no vulgar, pompous, excessively brilliant light, but a restfully even, inexhaustibly rich, cheerful light that fills the soul with joy and hope.

Corot’s light sheds its rays from a hopeful soul. It is luminous optimism in visible form. Some years ago, a Corot Exhibition took place in the Galliera Museum, and those who arranged it contrived to collect about the whole of the master’s life-work. I looked attentively at one point: it contained hardly a single evening, not a single autumn note or muttering of a storm, but only morning and spring and blue sky. That is characteristic of this child of the sun. In Corot the elements of beauty are nearly always the same: pleasant hill-countries, winding paths that lead to weird distances and invite our yearning to fare thither; at a curve of the road gleaming water mirroring silver cloudlets; in the foreground delicately-leaved trees; around and over everything the wondrous air thrilling with light, animated with a thin haze of mist, in which, bewitched by the feeling of spring, by an association of ideas, we fancy we can hear the soft bell-notes of invisible church towers, the twitter of pairing birds engaged in building their nests, and the buzz of early beetles. Some of the Corots in the Thiéry rooms, _e.g._, the view of the Coliseum, are youthful productions, and do not yet show the dreamily soft, as it were, inspired style and silver glow of his maturity. They are still somewhat dry and hard, yet, even in these more prosaic pictures, the heart-quickening light falls from heaven—Corot’s incomparable strength.

Corot did not belong to the forestmen of Barbizon, but he was the founder of their religion of light. Th. Rousseau shares with him the silkiness, and approaches him in the down-like delicacy of his young foliage. Daubigny has more temperament; he is sturdier, more manly, perhaps I should say: more like a peasant. What raises him to the rank of master is the depth of his pictures, and his gift of working out his subjects in almost stereoscopic relief, in all planes—in the fore-, middle-, and background. His “Skiff” is, therefore, an excellent example. The mast of the vessel stands absolutely free. We see how air is encompassing it on all sides. Dupré shares in equal degree the praise of his two friends. That is not quite just, for he has by no means so much personality as they. He does not feel originally, but imitatively. Nature moves him first through the eyes of his companions in art. He imitates alternately the softness of Corot’s foliage and his silvery mistiness, Rousseau’s smoothness and insinuating harmony of colour, and Daubigny’s tree-poetry, but I look in vain for the feature that distinguishes him from the others.

The delicate, and at the same time reverential love with which the Barbizon-men treat the individual tree, Troyon expends on domestic animals. As to the former the tree, so long as it does not melt in the haze of distance, is never merely part of the scheme, but a distinct, living being, possessing a physiognomy of its own, of which they render a strongly individualised likeness; so the latter regards animals with the understanding of a shepherd, who is known to recognise by their countenances all the sheep of a numerous flock. He will correctly depict the physiognomy of animals, without any propensity to giving them the look of human beings, through which animal painters only too easily become, without intending it, comic.

Millet is the continuation and consummation of the great landscape painters of 1830. We are not conscious of this if we regard him only by himself; but it is at once forced on us if we see him in the Thiéry Collection in connection with his comrades. Millet is also, fundamentally, a landscape painter, only his landscapes are animated by men; but not by men who are accessories, as is the case

with Corot, but by men who are a part of the landscape, its most important and essential part, precisely as the trees and clouds are, but more dignified and spiritual than trees or clouds. With him man grows together with his rural environment, is himself a bit of nature in the midst of nature, and it is not easy to decide whether he is degrading man, or is elevating the earth with all that on it creeps and flies, when he puts them on the same level. Millet discerns in nature an all-living element that can take manifold bodily forms and be expressed in a variety of ways, but is one and the same in all different forms. This grand pantheistic feature uplifts his pictures from _genre_ to high, spiritual art. And since nature is never comic, so Millet's peasants—themselves a bit of nature—never affect us comically, but always pathetically, even when they are as sturdy, clumsy, and simple as David Teniers's boors. In one picture in the collection, "Maternal Foresight," Millet has apparently a humorous intention: a peasant woman is assisting her very small youngster at the doorstep of her house in a little necessity. Even here I cannot find anything to laugh at, unless from kindly sympathy for the hop-o'-my-thumb and his tender mother. It is just a glance at life, and at such no one who feels a reverence for the sanctity of life ever laughs.

The devotees of the great Pan—Corot, Rousseau, Daubigny, Millet, and their followers of the second rank, gain in significance side by side. Their contemporary, Delacroix, loses beside them. What I felt at the Century Exhibition of French art, I feel even more strongly in the Thiéry rooms at the Louvre. I am afraid Delacroix is one whose trial must be revised. Perhaps we shall then be obliged to confirm the unfavourable verdict that the adherents of the Classical movement passed on him at his appearance, although on quite different grounds.

Delacroix was not in love with life; he did not seek and find nature; he followed in her footsteps only in books. He was essentially an illustrator; apart from Victor Hugo he is not to be thought of. The Romantics performed a duty of gratitude when, with fanatical violence, they carried him triumphantly through his detractors. He is their henchman with the brush; he fights with them and for them. They only act according to the rules of chivalry when they protect him. His magic colouring is not to be contested, although it is often gaudy and theatrical. But out of his "Hamlet with the Gravediggers," his "Medea," his "Bride of Abydos," his "Abduction of Rebecca" ("Ivanhoe"), a dreary waste stares us in the face, which would be hardly bearable if we did not happen to know the poems from which Delacroix drew his subjects. We must put life into his dead pictures by what we remember of our reading. Delacroix stops at the externals. We have to add soul and passion.

After the men of 1830 came, on the one side, the neat painters of the Empire, of whom Meissonier is the best type; on the other, the naturalists with Courbet, the impressionists with Manet and Monet; and so the development went on to the confused struggles of this moment. That period of the July Revolution was felt by its contemporaries as an age of storm and stress in art. On us later-born children it has the effect of halcyon days, the full, rapturous life and sunny joys of which the present generation longs for in vain.

VII

THE TRIUMPH OF A REVOLUTION

THE REALISTS

In the last years of the Empire and the first of the Republic, great things occurred on the sacred hill of Montmartre, on the summit of which the Church of the Sacred Heart had not yet supplanted the Muses and Graces. A group of painters, diminishing in number, yet brave as lions, and pugnacious, arose in defence and attack against the official art of the _Académie_, the _École des Beaux Arts_, and the _Salon_, which was still an institution of the State. Their palette was a battle-shield, their brush a lethal weapon for cutting and thrusting, their easel a barricade. Uproar was what they painted, and plunder and carnage were the subjects of their conversation in endless beer and tobacco sessions. They wanted to massacre the old idols in oil-painting, and the tyrants of the plastic arts now become twaddlers. No more painting by tinker, plumber, or chimney-sweep! No soot in place of air! No Dutch dolls in tin armour, with volunteer firemen's brass helmets on their gingerbread heads! On the contrary, an honest rendering of phenomena of light and colour from actual observation, sincerity, open air, and impression.

The first to gather with fury and wild gesticulation around the daring preachers of the new gospel were literary men and journalists. They did not understand anything about painting, and would not have been capable of distinguishing a varnished oleograph for a cab-drivers' public house from a real Leonardo; whether a picture was blackened or saturated by sunlight, whether a human figure was clumsily conventional or felt and understood with truth to nature, that was to them quite as indifferent as the colour of the Empress of China's dressing-gown. They had, however, the feeling that this movement in art was, in some way or other, connected

with thought of general subversion, and attacked the government. They thought they heard the naked women in Eduard Manet's "Down with Napoleon" shriek. The gleaming, noonday lights of Claude Monet seemed to them a cry for vengeance for the _coup d'état_. They understood Pissarro's landscapes as illustrating Victor Hugo's _Châtiments_, and Renoir's dancing _grisettes_ clearly pronounced a crushing verdict on the Mexican Expedition. All the enemies of the Empire regarded open air as an item of their political programme. To be a true republican one must swear allegiance to realism. Thus Gambetta and Zola became fanatics of the new movement, not on æsthetic principles—such did not exist for either—but from a tendency to opposition.

We should be wrong to laugh at a Radical mob orator and an anarchist novelist being fervent advocates of a school of painting from party interests. It arises out of a quite correct feeling. "All is in all." A close relationship unites all the phenomena of one time, and the most opposed forms may express a single fundamental mood. About 1868 realism meant quite as much a revolt against a bit of authority as republicanism did. Were not a luxuriant beard and a soft hat in 1848 proof positive of revolutionary sentiments? And about 1895 were not a tail-coat and a flowing neck-tie the acknowledgment of belief in blank verse and Maeterlinck?

From the first moment, then, realism had the honours of the opposition press and the support of those politicians, the majority of whom, later on, were to play the principal parts in the revolt of the Commune. The artists, to be sure, despised it at first, as long as it gained no _Salon_ distinctions and had no market. For a long time—for some decades—it had none. The public regarded the works of the new movement only as expressions of unconscious or intentional artistic humour. It laughed at them as it did at the saucy caricatures in the comic papers. There was perhaps only one individual who, a generation ago, took the Manets and Monets, the Renoirs and Pissarros seriously, and was prepared to manifest his belief in them by ready money—the only genuine martyrdom in our days—and this seer, prophet, and confessor was Caillebotte. He bought their pictures; not at a big price, it is true, for we must not expect the superhuman from mere mortals, but he bought them; he poured out his red gold for them, and this sacrifice probably preserved the life of realism, or, at any rate, of its teachers.

Caillebotte himself painted, but only for himself, and that was praiseworthy; but what was more important, he had acquired a handsome fortune by commerce, and spent the major portion of his fine income on open-air pictures. He did not exhaust his enthusiasm by that. When he died, he bequeathed the most striking pieces—"the pearls," he called them—of his collection to the French State, on the condition that it left them together and accommodated them with a room in a Paris museum.

The Department of Fine Arts at first made difficulties; but finally, it resolved to accept the bequest. The Luxembourg Museum was enlarged by an additional building, and a small room in the new wing now accommodates the pictures left by Caillebotte, amongst which he also smuggled in two from his own brush. Thus the Revolutionaries attained the honours of a State museum. This triumph crowns an adventurous campaign which, after apparently fatal defeats at first, led from victory to victory, and from conquest to conquest. For a decade and a half the art of the Manets and Monets has dominated painting. Only in the works of a few obstinate old fogies is their spirit untraceable, at any rate on the Continent; for in England, to be sure, they have not succeeded in gaining the slightest influence on the Præ-Raphaelite movement. On the other hand, in countries without old and uninterrupted art traditions of their own, for which the history of painting begins at the moment in which they themselves first co-operate actively in it, therefore especially in North America and Scandinavia, there is, as a rule, no other art. When the painters in these countries awoke to art, that was the newest thing, _le dernier cri_ of realism, and they took to this latest fashion, just as, in new colonies, negro ladies, who yesterday knew no other aid to their dusky loveliness than an apron of plaited grass and a few glass beads, insist that their toilet, or, at any rate, portions of it, shall be quite up to date.

But the victory in lands barbaric so far as art is concerned, and the apotheosis in the Luxembourg Museum, do not spell the end of the battle or the conclusion of peace. Realism had even recently to fight hard battles of persecution. Whilst the crowd pressed into the Caillebotte room, which was opened in 1897, and, it must be admitted, gave expression to very mixed feelings, certain masters of the Art School, the narrow Academician, Gérôme, at their head, sent to the Minister concerned a fiercely angry warning against the desecration of the Museum's hallowed rooms by the admission of rubbish which they characterised as "scandalous daubs," the "offspring of utter incompetency or lunacy."

The warning was wrongly timed. In 1897 it came too early, or too late. Too late, because Manet and Monet have apparently held their own against Gérôme and Gustave Moreau, and protests are futile against facts, or what are regarded as such at a given period. Too early, for people then still stood—and probably they stand now—at an insufficient distance from the movement now called impressionist to regard it from the perspective of history, and to assign it its proper place in the development of painting. That moment will come, most likely very soon. Then the protest of the Academicians will be superfluous, for even the æsthetic boors will repeat the verdict, then become a commonplace, that realism had its justification; that, besides transient harm, it was the author of

permanent utility; and that, after a half-miraculous progress not uncommon in the history of art, the new men, who themselves could do little or nothing at all, taught more competent successors something precious.

The Caillebotte room will help to bring about a correct estimate of the revolutionists of “the ’sixties.” Gérôme ought to have rejoiced at the opening of that room, for it really, for the first time, sets a legend in the light of history. For twenty years everybody has thought he had a right to chatter about realism, though few have really seen the documentary monuments of it, because up to now they were never conveniently accessible as a whole. The prototypical works of the Naturalist School were mostly shown cursorily in rare and little noticed exhibitions. Then they hung in their authors’ studios, or in some private collections. He who had not lived in Paris for thirty years, and observed with close attention all the details of the art movement, or did not undertake troublesome journeys of exploration and discovery, could speak of them only from untrustworthy imitations, or from absolutely worthless hearsay. Now, at last, the material can be seen by all. Whoever is capable of receiving his own impressions can procure them.

Extravagant enthusiasm for the pioneers of the “Open Air” movement will now be quite as little excusable as its condemnation without mitigating circumstances. The former will, in face of the Caillebotte room, be recognised at the first glance as sheer weak-mindedness, the latter as lack of understanding. That is the great service of this room in the Museum: it adduces all that can be said on behalf of realism, and shows at the same time, inexorably, its limitations.

I should like beforehand to exclude Raffaelli from the painters that appear in this collection. He is not a labourer from the first hour. Even later on, when he joined the movement, he was no orthodox believer. People, from their superficial knowledge, jumbled him up with the realists, because he was at first always, as the latter were often, a pessimistic confessor of the truth. His peculiar temperament decided his choice of sad subjects. In his outlook on life he was wont to dwell, with self-torturing choice, on depressing sights: on the sick in lazar-houses; on the homeless tramps in the moats about the Paris forts; on poor, human wrecks that float through the street-current of the great city. He told the story of these men with heart-breaking accuracy. He depicted them in mean, miserable, mud-tints; in the dust-grey of unswept, suburban streets; the sickly lime-white and dung-brown of neglected house-walls; the washed-out greenish-blue of worn-out cotton blouses. In this mood was painted his “Convalescents in the Hospital Yard,” with its livid faces beneath the white skull-caps, and emaciated bodies in blue dressing-gowns, on the dank, moss-covered stone benches, in front of the sullen lazar-house. This picture, like all of Raffaelli’s, makes up for the unpleasantness of its story by the severe honesty of its drawing; and in the street picture, “Behind Notre Dame,” the astonishingly effective employment of the gay red kerchief of a workwoman in the foreground, amidst the subdued tones of a murky Paris day in uncertain weather, shows what a clever and faithful colourist this painter is, who so long painted obstinately from a degraded palette. Nowadays, he has, in the main, overcome his depression of spirits, and in his soul a bright sunshine laughs, the rays of which are discernible in all his later works.

The real originator of the new tendency was Eduard Manet. Of his three pictures in the Caillebotte room, one, the “Olympia,” is a masterpiece. It had already long been the property of the Luxembourg collection, and amongst the academic works of that Museum it seemed so strange that it forced expressions of repugnance from most visitors. After this comes an insipid brown lady in a mantilla, and the important “Balcony.” “Olympia” is a faded, decayed lady of the class which people in Paris are accustomed to describe as “the old guard.” The person, whose hair is dressed for a _soirée_, but who is entirely without clothing, lies outstretched on a bed, displaying her charms, which might convert Don Juan himself to the monastic rule of chastity. By the couch stands a pretty negress, busied with her mistress. The “Balcony” shows two ladies with a gentleman friend, and a man-servant in the background. The two pictures display Manet’s purpose and method. There is nothing of impressionism and open air to be remarked in the “Olympia.” The scene is a closed room filled with diffused rays of chamber-light. The figures of the two women are accurately painted, indeed in a painfully and curiously dry style. In vain would one look for the smartness and bold dashing on of colour that are now held to be the characteristics of impressionism. It is all painfully and laboriously measured, without swing or freedom, without mastery over the model or the tone. The picture is revolutionary only in its straightforwardness. When it appeared, the academic masters painted prettily. When they had to represent nudity, they painted a sort of conventional rose-coloured jelly, without bones or physiognomy, smooth, ordinary, and superficially pleasing as a china doll, inartistic, and unspeakably tedious. In his “Olympia,” Manet rebelled against this prettiness in painting that so falsifies nature. He chose the most repulsive model he could find, and reproduced it with literal exactness in all its repulsive truth. He showed that there is female flesh not altogether too old that is not composed of snow and rose leaves. He taught his truth brutally and unwisely, with churlish violation of good taste and gallantry, but with ardour and conviction. The “Balcony” already announces the joyous tidings of open air. The two women are bathed in full daylight, which cruelly misuses their faces. Here, too, Manet wears the blinkers that narrow his artistic horizon. He wishes to oppose sunny brightness to the brown broth which was given out in the masters’ studios as the only colour whereby one could find salvation. He therefore lavishes his light, which overcomes and disperses the darkness; but he forgets that sunshine

influences local colours; that it gives them various effects, according to their illuminative power; that it envelops and blends them, however opposite they may be, in one single underlying harmony of silver or gold tone, and with no more misgiving than a saucy child, he lays on the canvas the true colours of things unaltered and unbalanced. I do not doubt that the grey-green of the window-shutters and the arsenical green of the obliquely crossed iron bars of the balcony are painted with the very trade colours which the house-painters actually use for these objects. Of course, this truth in detail produces the greatest artistic untruth in the whole, and the picture that was to be the Whitsun sermon of holy “Open Air,” becomes, through Manet’s inadequacy, a speech for the prosecution of the sun.

Claude Monet, the classic of impressionism, is not to be reproached with any incapacity. His execution never betrays him. He says what he wants to say to the last dot on the “i,” and if what he has said fails to satisfy, it is not because he lacked words, but solely because he had no more to say. Monet is a tippler, a drunkard so far as light is concerned. He cannot pass by any lively brilliant illumination without turning in for a painting-bout. Form, however, is to him a matter of indifference; it has no physiognomy for him, nor does it arouse in him any association of ideas. He neglects it absolutely. He does not draw or compose. In his pictures everything is without form, as in nature herself, unless we regard her with pre-existing thoughts of arrangement and meaning—in short, under the optical and logical categories. But he has not his peer in arresting the fugitive magic of sportive rays, their motes, their refractions on surfaces of every kind, on fixed bodies, liquids, and gases. His “Railway Station,” with its wide opening towards the railway line, the bluish clouds of smoke and steam from the puffing locomotive transfused with light, the shimmering vapour under the framework of the iron roof, is unsurpassable as a rendering of absolutely meaningless effects of light. Pictures of this sort will become expressive only when the photography of natural colours is so perfected as to admit of instantaneous copies. Equally remarkable as painting, and more valuable as higher art, is his “Interior of a Room,” with a shadowy boy and plants in the foreground, and a shining floor flooded with blue from daylight pouring in like a cataract through the window in the background. More valuable artistically, because this interior of great elegance, this outline of a child, and this blue, fairy-tale tone of the flood of light, are capable of awakening mood, _i.e._, will have an effect not only on the senses but also on the soul; will stimulate not only the optic centres of perception, but also the higher centres of conception and judgment. “Breakfast in the Open Air,” and two landscapes and marine pieces, are painted after the same rule as the two panels I have described.

Gueuneutte’s “Morning Porridge” draws its inspiration from Raffaelli, Degas’s “Dancers and their Mothers” from Manet. I put Degas, however, above Manet, for he draws more lightly and smoothly than the latter, and when he has to depose to ugly reality under the witness’s oath of his naturalistic conscience, he does it, not in an angry and provoking way like Manet, but with the divine gift of humour.

Monet’s joy in light becomes with P. M. Renoir an affectation. He has not the simple love of truth of his comrade. He falls into exaggeration which betrays conscious purpose and straining after originality. His two “Young Girls” at a piano of the colour of cranberry syrup; his nude figure of a woman, on whose skin lights and shadows play so unfortunately that she looks as if beaten black and blue, in places even as if studded with the corpse-stains of putrescence in the second degree; the “Girl in the Swing,” and particularly the “Ball at the Moulin de la Galette,” seek rather to disconcert than to convince us by their unwonted tones. These pictures have historical importance as ancestors. From their jests of colour are descended the jokes of Besnard, from their rain of sunlight through shadowing foliage comes the piebaldness of a Zorn and particularly of a Max Lieberman, who make an eruption of yellow and reddish spots fall on their bodies. Renoir’s “Girl Reading” finally is a simple aberration. He who tolerates such stumps of hands in a picture that is not meant for a mere sketch is either without capacity or without conscience—the one as bad as the other.

Pissarro is the triumph of seeing without thought. He seizes all the marvels of transformation which the light of various periods of the year and hours of the day accomplishes on objects over which it skims, with the same certainty as Monet, but he imagines even less over it than does the latter. With him the impressions which he feels from the outer world do not generally pierce beyond the back of his eyes. He is a remarkable instance of the sharpest sight with the retina in conjunction with absolute soul-blindness.

The panegyrists of impressionism assert that it was not well represented in the Caillebotte collection. That is a pretext of perplexed swaggerers who can now be nailed fast, and who should in shame and confusion crowd here, where it is easy to test their wild exaggerations. Impressionism has never produced confessed more characteristic works than those gathered in the Caillebotte room. It has never been more straightforward than in Manet’s “Olympia” and Degas’s “Theatre Mothers,” never more bright than in Monet’s “Breakfast in the Open Air” and Pissarro’s landscape, never was it in a higher degree lightening-sight and instantaneous painting than in Monet’s “Railway Station.” Every verdict on impressionism based on this room is an adequately grounded verdict, against which the attempted higher appeal to I know not what unknown works must be rejected.

The painters who entered on the new movement are interesting as men, because they aimed at much, and at what was comparatively great. They are, from an artistic standpoint, uninteresting, because they achieved little. It is the old tragedy of the will, to which the strength plays traitor; of the mind, which subjectively and _in posse_ brings about the highest, but objectively produces nothing, because it fails in realisation. The Manets and Monets, the Renoirs and Pissarros, wanted to create a new art by returning to the old truth. It gives them a right to reckon themselves as belonging to the family of the illustrious heroes of the Renaissance, who emancipated themselves from the traditions of the Byzantine School, as the former did from the sham-classic rule of a Couture, a Cabanel, or a Baudry. The man affected by a Cimabue and a Giotto will not be unmoved in the presence of Manet and Monet, especially of Monet, for he performed a creative act. He said: “Let there be light,” and “there was light” in painting. The miracle of Genesis is still being wrought to-day, and only in Gustave Moreau and the Præ-Raphaelites has the Logos proved itself powerless.

After paying them this tribute of recognition we will also take leave of them. They have pointed out paths, but they have not walked in them. In place of intricate Chinese signs, they have invented a free, brilliantly progressive alphabet, but in this script they had nothing to say. Their art is merely optical—neither emotional nor ideal. They were commonplace—nay, to some extent—unbeautiful souls. That is why, despite their honest passion for truth, and despite their precious medium of sunshine, they have not been able to produce genuine art-work.

They have meanwhile not lived in vain. Their influence has been fruitful. At first it indeed generally did harm. All bunglers flew to imitating them, and the impudent rabble of both worlds alleged they understood their teaching thus: “Drawing is superstition, and the more repulsive a hide looks, so much more beautiful and especially more modern it is.” But after this scum of the artistic rabble those who had a vocation came over to the new movement, and showed what it could achieve in consecrated hands. With the open air Roll became the master he is; impressionism brought a Brangwyn to maturity; truth—the beautiful truth, not the repulsive, vulgar truth—found its triumphs in a Whistler and a Sargent. The weaknesses and mistakes of the forerunners have furnished despicable parasites with the transitory reputation, among the weak-minded, for genius, which will quickly disappear before the recognition of their wretchedness. Their lofty views, and, to some extent, the means of expression suggested by them, have, however, equipped men of illustrious talent, who permanently enrich mankind’s property in works of beauty.

ALFRED SISLEY

Alfred Sisley was one of the most renowned amongst that group of realists to which I alluded in my foregoing appreciation of the Caillebotte room in the Luxembourg Museum. He, too, like his companions—Manet and Monet, Pissarro and Renouard—was a rebel against traditions, and a preacher of new gospels. He also denied old idols with fine disdain, and preached doctrines that seemed to him to embrace in themselves the whole truth. He managed, indeed, to collect a few convinced disciples, but, on the other hand, hardly any congregation about his altar or pulpit; and this was due simply to the sobriety and uncongeniality of his dogmas, which failed to satisfy the cravings for æsthetic devotion of the faithful.

Sisley was a landscape painter. He was purely this, to the exclusion of every admixture. He never introduced a human figure, and, so far as I remember, only one of an animal, into his paintings. The only life that moved and stirred in them was that of atmosphere: the play of lights, of their refractions, of their coloured dust, of their vanishing in shadows and darkness of various depths. Even the vegetable world, though one of the most important elements in academical landscape painting, he treated slightingly. He had no respect for the attractive individuality of a tree. It interested him at most as an object in his field of view, which catches and diverts the beams of the sun in a particular way. He saw nothing of the marvels of colour and form of the minute life, that is displayed in a piece of turf, a bush, or underwood, and reveals to the thoughtful and experienced eye the whole nature-tragedy of the struggle for existence: the despairing striving in the various plants for air and light, or moisture and shade; the victorious domination of one or several species; the meek supplication for mercy of single scattered flowers or plants; the defeat and flight of families unable to maintain their position against superior antagonists; the intrusion of bold strangers demanding for themselves a place among the old settlers; the confederacies of friendly groups that reside together and trust each other; the single combats of enemies seeking to throttle and uproot one another. He who has never gazed deeply into nature perhaps regards all these pictures of combat and triumph as mere phrases, corresponding to nothing real. The biologist of plants knows better, to be sure, and many a landscape painter too; so did the first English Præ-Raphaelites especially. However unbearable their vagaries and perversions may be—on these I will not enter now—this one thing must be said in their praise: they understand and love plant-life. For them every grass and herb, to say nothing of those lords, the trees, has a physiognomy, a personal mystery, which they know how to unriddle, and reveal, or, at any rate, indicate. Of all this Sisley knows nothing. For him a grassy mead is a plain of colours with gradations, starred with

varied patches; always a mere study of light and nothing else; never an expression of events of life.

Here lies the limitation of his capacity. In my book, “Paradoxes,” I have tried to classify painters according to the rank of that segment of the central nerve-system, in which their talent is rooted. By this method I arrived at a distinction between painters who feel joy only in colours and their harmonies, and others who, besides delighting in colour, often even without this, have a developed sense of the proportion of things in space, therefore, of forms, reciprocal distances, movements so far as these latter can be indicated by means of the painter’s fixed process: those, in short, who know how to elicit from visible phenomena an invisible, emotional significance, and to represent them so that they express, in a natural way, psychical processes and feelings, without becoming falsified through the intentional introduction of arbitrary features foreign to them. Now, Sisley is an instructive instance of those painters who are painters only through their retina and lowest centres of perception, viz., their feeling for colour, and the vivid sensation of enjoyment it affords them.

Sisley has the most delicate sense for the lightest gradations and depths of colour. If I may use an image from an adjacent intellectual domain, he does optically what an ear would do acoustically which was capable of feeling purely all the tones of a chromatic divided, perhaps, into sixty-fourths. This faculty gives him his rank as an artist, but it was also the torturing demon of his life; for he wanted to reproduce with equal clearness what he saw so distinctly. That is, however, impossible by the medium of oil-painting. Let it never be forgotten that the colours an artist uses are very different from the natural appearances which they wish to recall. All painting is a translation that falls short of the original text, and even the most refined palette only permits a vulgar groping after the subtle play of colour in the reality. It is sheer convention, to which our eyes are artificially trained, that we recognise in definite play of colours, human flesh, an evening sky, foliage, or mirroring water. In all cases we have, at most, approximations before us, and even a man’s countenance by Franz Hals reproduces the true coloration of the skin on a human face, as little as perhaps the well-known _scherzo_ in the second movement of the Pastoral reproduces the true note of the golden oriole. Sisley, overlooked, like the majority indeed of impressionists, and like many very juvenile stipplers and black and white artists, this technical main condition—if you like, this main defect—of all painting with media as at present known; and he obstinately insisted on overcoming a difficulty that is, as a matter of fact, insuperable. The whole labour of his life is a struggle with the resistance of matter, intensely pathetic, but, nevertheless, finally only irritating, because its utter hopelessness is admitted. He tries to square the circle, which, as may be proved to him, is not feasible, and he aimlessly dissipates his energies in this futile effort. He is bent on arresting the most fugitive vanishing, the gentlest swaying of a ray of light, and, as it were, the fourth decimal place of a fraction of colour, and on fixing it on the canvas. And as he cannot conjure forth this feat from his colour-tubes, in spite of the most learned and complicated mixing, he tries to reach his goal by newly invented tricks of the brush. Thus he gets to dotting and spotting. Innumerable minute touches with the brush are to leave behind a chaos of colour-dots, from which the eye may come to discern, or, at any rate, get an inkling of, the play of colour in the actual object. This method is extremely laborious and risky. It postulates great patience and ability to emphasise in the minute work the firm lines of the drawing. For if one loses sight of these lines, or cannot make them ring out clearly from the colour gamut disseminated equally over the whole canvas, the picture dissolves into a shapeless daub. Sisley himself is often wrecked on this rock. By his method, however, in a few happy moments, he obtains, to be sure, effects which would scarcely be deemed possible. Then we may enjoy in his pictures a real dance of sun-motes in transfulgent air.

A single picture of Sisley’s even the connoisseur easily passes by. It is insignificant. Even a whole row of pictures which represent different themes will hardly make a great impression. At most, certain delicacies of tone, a certain far-sighted clearness of atmosphere, make an impression. If, on the other hand, you see near one another panels which depict the same subjects at different hours of the day or seasons of the year, under different lights and conditions of weather, you grasp in astonishment the meaning of this artist. The subject is the same, but so altered as to be hardly recognisable. People marvel at the power with which Sisley can arrest strangely changing aspects, and gain some faint idea of the difficulty which the exposition of observations calls for, observations which are generally out of reach of any but the most acute feeling and the most painful attention. Sisley has openly admitted that his skill is unintelligible without the key afforded by comparison. That was why he exhibited, as a rule, at least two—usually many more—treatments of the same subject. Thus in the _Salon_ in the Champs de Mars in 1898, he showed a beach, “Lady’s Cove,” in two lights; and, in 1896, Moret Church, in transparent pale lilac just before sunset, and also in softly-veiled slate-grey in rainy weather. I remember a row of studies of the same village church, which ran through all the divisions of the spectrum, one after another, and, on each succeeding panel, was a revelation the more dazzling in proportion as one already knew its form in all its details. Sisley has hardly ever had his equal in transposing a piece into different keys.

Admiration for the almost morbidly exaggerated sensitiveness to the slightest differences in tones of colour, and sympathetic feeling for the artist's despair at the inadequacy of a technique, gross, after all, as the medium of the most delicate intentions—these are the impressions which one feels at even the most friendly consideration of Sisley's most successful works. Dreaming and longing, reminiscence and presentiment, on the other hand, they never inspire, for they are absolutely lacking in all psychic, emotional, and imaginative sense.

From the example of Sisley, we recognise the accuracy of the maxim which, when put nakedly, sounds almost provokingly paradoxical, and yet is literally correct, viz., that landscape painting, or, at any rate, a certain kind of landscape painting, is the most literary of all species of plastic art, the one from which the least is received, and into which the most is put. Landscape painting seems to reproduce nature herself, and therefore necessarily to be as objective as a land surveyor's plan, or even as a photograph. It is, as a matter of fact, incomparably more subjective than portrait, historical, or _genre_ painting, for there is throughout, not nature over again, but the features of nature which have excited the attention of the painter, and aroused in him a mood. It therefore discloses to us, more than any other kind of painting, the soul of the painter, the peculiarity of his mode of feeling, the bent of his dreams, and the object of his longing. If every work of art is a confession on the part of the artist, landscape painting is a particularly complete and honest acknowledgment. It is a portrait of the artist, which he himself has painted, transcribing all the wrinkles of his soul.

Nature in herself is absolutely expressionless. The feeling of the person who contemplates her first adds expression, just as his senses translate the movements of the atmosphere and matter, which are, in themselves, devoid of colour and sound to the perceptible values of colours and tones. The contemplation of nature awakens in us associations of ideas, and these we project into nature. Therefore we find, again, in this latter the whole range of emotion and thought of our consciousness, and nature, therefore, influences every one who contemplates her correspondingly to his education and mental habits.

Landscape painting is, then, also a continuous illustration of the literature of its time. It is anti-classical in the Renaissance and Late Renaissance up to Poussin; Ossianic and Rousseauesque in the eighteenth century, and, in Corot, is Lamartinish. It would, of course, be going too far to point out here what the relations are between each individual great landscape painter and the writings of his contemporaries; and how certain notable exceptions from the rule of parallelism between landscape painting and the fashion of the day in literature—Salvator Rosa, Ruysdael, and Turner (just to mention only three)—are to be explained. It is, meanwhile, not to be disputed that the landscape painter approaches nature with a soul filled with the literary spirit of his time, and puts into her what he has retained from his reading. A painting, then, awakens also in the mind of the spectator an echo of all the poetic melodies that have enthralled him, and it is the soft echo of these thousands of poetic voices in our soul, to which we listen when we enjoy a landscape painting.

We listen, however, in vain before a picture of Sisley's; all is still in our soul. This is because the painter has regarded nature from a wholly unliterary standpoint. She awakens in him no associations of ideas, therefore his pictures awaken none in us. He has seen the play of colour, found his delight in it, and has taken no further thought, but has merely striven to reproduce it accurately. We follow his efforts with curiosity, and approve the results if they are successful. But in this appraisement, humour and imaginative power have no part.

Is such landscape painting art, or a clever trick? The question is worth careful consideration.

CAMILLE PISSARRO

One of the most interesting artists in our times was this Pissarro, born at St Thomas in the Danish Antilles, though of a Dutch Jewish family of Spanish extraction settled in Curaçoa, who died in Paris in 1903 at the age of seventy-three. He was a born painter, of the class whose sense of form hardly exceeds the average, whose remarkably fine perception of colour, however, reacting very strongly on every optical irritation, makes the excitement of the retina the source for them of profound feelings of pleasure or the contrary, and fixes their idea and thought, to a certain extent polarises it according to colour.

It is sufficient to say few words as to his outer life. Impelled by his bent for painting, he came to Paris at the age of twenty, and had the good fortune to be taken as a pupil by old Corot. He saw Th. Rousseau and Millet working with his master, and he lived during the most susceptible years of youth amongst such originals, in the most glorious Barbizon period. His natural tendency directed him imperiously to landscape painting. This, then, is the substance of his whole life as an artist. Incited by Millet's example, in his young days he put peasants in his fields and meadows, but they were always mere accessories in the landscape, and arrested the eye less than the ground and plants. He had then also sufficient knowledge of himself to abandon, at an early stage, human figures, for

he realised that there was more life in the tiniest sod of his turf than in his conscientious but insignificant villagers. In the high school, in which it was his privilege to learn, he acquired that certainty and force which distinguished him up to his old age. When, however, he had mastered Corot's brilliant technique and Rousseau's draughtsmanship and composition, he ceased to be an imitative disciple, and with full deliberation, went his own ways, which for a time lay far from Corot's goal, but at last, by a wonderfully circuitous route, brought him back to it once more. Not long did he try modestly and laudably, with a good young man's carefully moderated works, in the _Salon_ for certificates of industry and good marks from the academical masters. At once he joined the hot-headed set; he exhibited, from 1864 onwards, only in the "Salon of the Rejected" and with the "Independents," and became one of the most prominent men in the group of impressionists.

Nothing is funnier than to read the explanation of the terms "Impressionists" and "Impressionism" of certain art-gossipers among the critics in Germany. These transcendental phrasegrinders, who have no notion how the word arose, believe it was invented by painters or æsthetics with the set purpose of characterising an artistic tendency, and of indicating elliptically a method of execution; and, with the rapturous, prophet-mien common among this brotherhood, they treat us to the deepest and most breath-ravishing explanations of the word. The truth is that the expression owes its origin to the jest of a comic paper that intended nothing special by it, least of all an æsthetic theory. In 1874 the painters who for ten years had been known as the "Open Air" artists or "Realists" exhibited a number of their works in the reception-room of the writer and photographer, Nadar. Claude Monet appeared, amongst others, with a sunset, which was quite in the manner of Turner's last years, and he entitled it "Impression." It was a remarkable and characteristic work, without form, consisting only of streaks of red and orange, in the highest degree offensive to those who will not have the contemplation of nature restricted to the observation of colours, but look also for outline and modelling. A wanton scoffer, making merry in the "Charivari" over this exhibition, seized on Monet's "Impression" as the pattern of the new style, sneered at it in the tone of a genuine back-biter, and, with the object of belittling them, called Monet's fellow-combatants "Impressionists," by which he meant only that, according to his view, their pictures were daubs, just like Claude Monet's "Impression." That is the simple origin of the word into which the German commentators have read something exceedingly mysterious and wonderful.

Pissarro belonged to Monet's circle of friends, and fell under the designation, which rapidly became current, of "Impressionist." In his case, it only means that he sought and found in nature only effects of light, only the play of sunbeams on things and around things.

In the three or four centuries that landscape painting has been raised to the rank of a branch of art—I leave out of consideration, in this place, the ancient landscape, because the modern development is unconnected with it—an enquiry, which enters into the motives and aims of painters, can distinguish three different kinds of landscape, which I would term respectively the literary, the lyric, and the optical. I do not choose these new designations for old and well-known things arbitrarily, but because, in my opinion, they mark what is essential better than do the prescriptive ones.

Literary landscape, on which I have already briefly expressed my views in treating of Sisley, is that which traditionally goes under the names of historical, heroic, ideal, or artificial landscape. It is not prompted by delight in nature, but is either the offspring of imaginative power or a piece of intellectual know-all work, in both cases, the result of reading. It is, to put it briefly, a continuous illustration of the literature in vogue. Since the Renaissance, ancient heroic materials have been specially favoured in poetry. The Spanish theatre, Corneille, and Racine lived on them. Even if they placed the lofty exploits of their heroes in a less remote past and on another stage than the ancient world, still, they endowed them with hundreds of reminiscences of the Græco-Roman mythology and history. Poussin, and even Claude Lorrain, conceived their landscapes as the frames of heroic romances and dramas. They were designed as stage decoration, which the spectator might people from his memory with figures in Roman mail-armour or Gothic plate-armour, familiar to him from contemporary poetry. In order to facilitate this play of fancy, ancient temples or ruins, perhaps even men in classical garb, helpfully stimulate the association of ideas. J. J. Rousseau substituted the sentimental for the heroic fashion; but the return to nature, which he and his innumerable imitators preached, did not to landscape painters at all mean the sinking into the contemplation of God's actual world, but only the substitution for the heroes and knights, the upright or fallen marble pillars of their predecessors, of shepherds and shepherdesses, rustic cottages and herdsmen's fires. Thus landscape painting illustrated in turn Orlando Furioso, Jerusalem Delivered, the Æneid, the tragedies of Corneille and Racine, Rousseau, Gessner, and Ossian; then, nearer to our time, Victor Hugo and the Romantics, Zola and the Naturalists, down to the latest symbolists and mystics, whose contemplation, so far as one can speak of such a thing in their gassy heads, greets us from the pictures of Burne-Jones and his continental imitators, and also from the landscape compositions of Puvis de Chavannes and Henri Martin. It may be safely affirmed that, of the pictures of literary landscape, not a single one would have been painted unless a book or some species of literature had, to some extent, commissioned them with an exact specification of all details.

Lyrical landscape is that which is perhaps also designated landscape of mood. It is more consistent with nature than literary landscape. It owes much less to reminiscence of books or plays; its only relation to literature is that through this the painter is schooled to be more susceptible of certain features of nature. Landscape pictures of this species could be painted under some circumstances by artists who had never read a book or heard a poem, if only their own disposition were attuned to poetry. For this painting the landscape itself is a poem—ballad, romance, or idyll, in many cases, perhaps, even a melodrama. It tells some tale, or hints at one, the more delicately so much the more expressively. The wrinkles of the ground, the irregularity and abruptness of the lines of mountains, the gloom of the woods, awaken presentiments; our yearning follows the paths which are lost in the blue distance, or behind hills and bends; coolness rises from the foaming rivulet; mystery broods over the motionless fish-pond. Everything unspoken, or partly unspeakable, which a keenly perceptive man of deep contemplation imports into nature, moves and reigns in and over the lyric landscape painting. It expresses a complex, subjective mood, embracing in itself many elements of sense, feeling, and thought—the joy of spring, the melancholy of autumn, the cheerlessness of winter, the shudder at the weird, the dread of eternity. It is viewed anthropomorphically. It owes its strongest effects to traits which do not exist in nature herself, but are added to her by human imagination. Japanese art knows only lyric landscape. In Europe it was first developed by the great Dutchmen, Ruysdael and Van Ostade, to attain in Corot its zenith unsurpassed up to the present time. As it lays expression into its forms, it must figure the latter distinctly. It draws and composes, therefore, with deliberation. It proceeds from the realistically rendered topographical anecdote, even if it achieves this by the transcendental.

Optical landscape, finally, is that which seeks to reproduce only the play of convergent or divergent, of reflected or broken light in nature. It is neither book-illustration nor views of places. It does not invite to the enjoyment of nature in the sense of the Sunday excursionist from big towns, or the summer tripper. It offers no scene with suggestion that we should live out our subjective moods there. The outlines, the plastic of the bodies, are a matter of indifference to it. Everything is merely a patch of colour to it; only an arena of dancing sunbeams. It wants to reproduce, as truly and fully as possible, the change and merging of lights and shades, the reciprocal influence of neighbouring and overlapping colours, the _crescendo_ of hues in the foreground and their fading away in the perspective. It systematically rates the intellectual and moral relations as foreign to its art. It is not enthusiastic for a particular season of the year or a certain architecture of cliffs and mountains. It knows nothing of the secret magic of water, heath, forest, or snow-plain. It gives light in scales, and in harmonised and dissonant chords, and will give nothing else. This landscape painting is an art of purely sensual preception, which may call pre-existent feelings and thoughts over the threshold of consciousness, but brings about no feelings and thoughts of itself. It is to be compared with the effect of the Æolian harp, which stimulates our hearing with melodious sound, but says nothing thematically differentiated to it. Debussy, latterly, consciously strives back to these origins of acoustic pleasure. The disciples of Turner in England and on the Continent enter in landscape on the same way back to a style of painting which, neglecting form, lays stress on the harmonies of light and colour.

In practice, besides the three sharply outlined species of landscape painting, manifold transitions and mixed forms are, of course, also observable. If, perhaps, G. Poussin represents literary, Corot lyric, Turner, at the time the formation of his cataract began, optical landscape, in its theoretical purity, we see in Claude Lorrain a revelling in light and a poetic mood penetrate the mytho-heroic literary painting which he owes to his artistic training, and from which, in spite of higher flights, he could never entirely free himself; and Segantini is a good example of an originally lyrical landscape that is always more strongly inclining to the optical; for if at the beginning he loved to copy high mountains, at last he busied himself only with fixing the wonder of light in thin air on the mirroring ice and glacier snow.

Camille Pissarro was mainly, in separate periods of his artistic development exclusively, an optical landscape painter. The attunement with nature which is afforded by the meeting of mountain and wood, water and reed, by the forms of trees and cliffs, the peculiarities of plant-life, and the movements of open country, he evidently did not feel and he cannot arouse. He was nothing, and he wanted to be nothing, but a priest and poet of light. When light fell, what objects it illumined and played on was a matter of such indifference to him that this landscape painter painted city scenes just as often as those of open country. Views of the Paris Boulevards, the Avenue de l’Opéra, the Seine seen from the bridges, the streets and squares of Rouen, occupy quite as large a space in his work as studies of the valley of the Marne and the hills of Southern England. Thanks to the good school from which he came, he never, like so many of his rivals, melts away into formlessness. He could not refrain from drawing distinctly. It was the movement of his bold and skilful hand that pervaded his will; but the sole hero of his pictures, to whom he gave his love and attention, was light.

After he had outgrown the formulæ of the Corot type of landscape, he sought with persistent, hot endeavour to find a method that would qualify him to draw into his picture as much light as possible, as intense light as possible, even the whole sun. What he

himself found failed to satisfy him. When Seurat, who suffered undoubtedly from eye troubles, came forward with his stippling, Pissarro at once took possession of the new manner, and became a stippler even unconsciously. Seurat, it is well known, taught that the painter, if he would give truth and force to colour, must not mix the shade on his palette and transfer it ready-made to the canvas, but must dissect it into its primary colours, which are known from the spectrum, and insert them in little dabs by one another, so as to leave it to the eye to put them together again on the retina. This optical proceeding professes to have been learnt by listening to nature, which also offers us only as single colours what we feel as a synthesis of colour. The theory is sheer nonsense. Nothing of the sort happens in nature. When we see green grass we do not see yellow and blue grass which our eye mixes into green, but we see a body proceed from the æther-vibrations of the undulations, which call forth on the retina a sensation of green; and to imitate this influence of the grass we have to employ only one colour stuff from which atmospheric vibrations of similar undulations proceed. Unscientific painters were, however, impressed by the sham-scientific jabber of Seurat, who tried, in his wonted manner, through a subsequently discovered theory, to convert a defect of sight into an advantage; and they applied themselves the more zealously to stippling as the innumerable specks really made bright a twinkling, whirling impression, which superficially reminded one of the vibration of hot air on a sunny plain at midsummer noon.

Only superficially. Pissarro soon discovered that stippling really did not bring more light into his pictures, and he gave it up. He resigned the Seurat method to rivals who rush after eccentricity because they hope to astonish by it, and to whom a style of painting was particularly suitable, which blurred the line with colour and saved them that tedious drawing that always gave them the greatest affliction. He himself, however, returned again to the honest style of wielding the brush, which he had learnt of his great masters.

The stippling episode of his life, which he got over, throws light, however, on the painful, fundamental mistake of Pissarro and his companions. They wanted to paint light, and by that wanted something impossible, for light is not to be represented by colours which do not themselves emit light, and are neither phosphorescent nor fluorescent. All that is attainable by colour is awakening the reminiscence of light, and, by means of the memory-picture illuminating the brain, to cheat our consciousness with the idea of a directly received impression. The very great masters of optical landscape painting soon acknowledge, or feel, that the brush can indeed conjure forth the illusion of illumination, but is unable to paint light, and they turn from a hopeless Sisyphus-task to create pictures of mist and dusk, from which sunlight—a thing inimitable—is absolutely banished. The most instructive example of this is James Whistler; but he who does not possess the instinctive certainty of genius will not be conscious of the limitations of human capacity, and ever rolls the round stone unweariedly up the mountain.

Pissarro would have saved himself many hours of tragic quest, struggle, and sense of powerlessness, had he known or recognised the primary fact which Friedrich Hebbel seized in his theological but lucid epigram:

“He who the sun has created will ever remain quite another Than the industrious wight who for us prospects shall paint.”

WHISTLER’S PSYCHOLOGY

“Do you think, prince, that Raphael would not have been the greatest genius among painters if he had been unlucky enough to be born without hands?” Lessing makes the painter Conti say to Prince Gonzaga. A century and a half ago that seemed paradoxical, and was, probably on that account, one of the most quoted maxims of Lessing’s. It has, meanwhile, experienced the fate of many paradoxes, viz., become a commonplace. Nowadays, every dabbler in psychology knows that not arm and hand—_i.e._, execution—make the painter, but his optical brain centres, _i.e._, his sensitiveness to impressions of sight, his specific reactions on colour and form. One is a born painter—a painter from organic necessity and natural bent preceding all education—only by special development or susceptibility of this centre.

In painting, however, there are two elements to be kept distinct—drawing and colour. Both these are traceable to the centres of sight, but they correspond to different sensibilities. Optical centres, which perceive with particular keenness and delicacy the distinctions between intensities of light, are the real, organic hypothesis of the talent for drawing; for what we perceive with the eye, without the aid of the senses of touch and muscle, as outline or form, is purely distinction of intensity in light. Optical centres, on the other hand, which are particularly sensitive to the variations of undulations of light, form the basis of the sense of colour and the talent for colouring. As a rule the talents for drawing and colouring appear coupled, even if one or the other preponderates, for highly developed or particularly sensitive optical centres are naturally receptive beyond the average of optical impression of every sort, of differences both of intensity and of undulations of light. This is, however, not always the case, and there are dry, sharp draughtsmen without sense of colour, and some who revel in colour without the ability to grasp the idea of form and render it

plastically.

In a brain that is characterised by a special morphological or functional development or sensitiveness of the optical centres, this dominates all functions of the brain, especially memory and association of ideas. The entire thinking faculty has an optical or visual character; it stands in a dependent relation to sight. Memory clings almost exclusively to reminiscent pictures of the sense of sight, and association of ideas connects mainly pictures of this category. Every perception of form calls up in the consciousness representations of form. The fancy is “inwardly completely full of figures,” as Albert Dürer quaintly and with wonderful intuition expresses it in his “Diaries.” The world-picture of this brain, always disposed to intense observation, is neither loud nor excited, but bright, flashing, and radiant like a mosaic work of precious stones and enamel. All the inner connections between the different domains of the brain are sharpened towards the optic centres, and all the activities of the brain, all emotions, all processes on the threshold of consciousness also release central optical excitements.

Whistler’s life-work reveals more than that of any other artist in our times the deep, organic primitiveness of his genius as a painter. We can observe in him, as in a school text, the psychology of the born painter. His signature is at once a fine example of the association of ideas on the part of a visionary. It consists, as everybody knows who has seen Whistler’s works, of a butterfly with evenly outstretched wings. People have insisted on seeing heaven knows what symbol in this, and have consequently sought the wildest and remotest explanations of it. If any one asked the master for an explanation, he laughed, and made a mysterious gesture of refusal. It gave him vast entertainment to see his admirers tormenting themselves with profound attempts at interpreting it. They just had no eyes; they could not see. The butterfly is nothing but the first letter of Whistler’s name—a big W. A Gothic, ornamental W with the two side lines bellied out and a bar in the middle reminds one strikingly of a soaring butterfly with its cylindrical body between its outstretched wings. The definite association of ideas from similarity of form made Whistler, as he painted the W of his signature, think of a butterfly, and he henceforward formed this picture that was fuller in expression, disregarding the original letter, which seemed to him balder and more meaningless. The butterfly came to the front more and more as the W went further and further back, and it is possible that at last Whistler himself forgot the point from which he started.

Whistler was, when he liked, in the front rank as a designer of forms. From the severe, painfully upright school of Gleyre he went forth a master of drawing, as of the outline of corporeality of three dimensions seen stereoscopically. One glance at his wonderfully plastic portraits, especially of his first period, teaches this irrefutably; but, on the whole, as his individuality made itself felt, he neglected form and became more engrossed in colour. In the second half of his life the outlines of subjects hardly any longer interested him at all; he only dwelt on their appearances in colour, on the harmony or discord of their tones. That means that his optical centres were much more sensitive to the differences of undulations than to those of the intensity of light. From this there necessarily resulted a contradiction between him and the average individuals which was not to be got over, since it originated in differences in the constitution of the brain. He who has not Whistler’s special hyper-sensitiveness to colour is simply unable to see things as the latter saw them. He can just as little imagine the impressions that Whistler feels through his sense of sight as perhaps those which are supplied to a hound by his nose. When the blissfully but painfully supersensitive appreciator of colour and the dull seer of outline, _i.e._, the perceiver of light, sought to explain themselves to each other, inexplicable misunderstandings were bound to arise, which make his celebrated law-suit with Ruskin an excruciatingly comic jest. Ruskin appreciated only draughtsmanship, his mind never went beyond contour. For him a picture was a writing that should express thoughts and feelings in the most concrete form. He demanded that it should be a definite communication, reducible to plain words, as of a narrative, a record of travel, or a treatise on natural science. A picture that differed from an exact representation, just as music differs from articulate speech—a picture that attempted to convey only a general, not a concrete stimulation of the sight-centre sensitive to colour, and the pleasurable feeling accompanying and emphasising it, not only was to him necessarily incomprehensible, but, as he was a dogmatist of strong feelings, seemed to him an impertinence—nay, a profligacy and personal insult. Ruskin’s criticism of a “Nocturne in Black and Gold” was a new version of the fable of the stork and the fox who invited each other in turn to dinner, improved to the point of libel. It was childish of Whistler to bring an action against the angry-minded art-inquisitor who required, as the first duty of a painter, the accuracy of a geologist, botanist, or engineer. He should not have expected justice from judges who saw and felt, not like himself, but like Ruskin. Judge Huddleston was of good faith when, in the immortal trial—which Whistler himself has preserved for posterity in his charming book, “The Gentle Art of Making Enemies”—he exchanged with the artist remarks like these: “Which part of the picture, then, really represents the bridge? Do you mean to say that this is the proper representation of a bridge?” (The question referred to “Battersea Bridge by Moonlight.”) “I had no intention of giving an exact copy of the bridge.” “Do these daubs of colour on it represent human beings?” “They represent what you please.” “Is that thing under there a boat?” “It is a consolation to me that you recognise it. My whole object was only to produce a definite harmony of colours.” He could hear this harmony of colours: Ruskin and Judge Huddleston could not. It was utterly futile to try to make them feel it.

His peculiarity of giving his pictures fine and pretentious names, such as “Black and Gold,” “Blue and Silver,” “Ivory and Gold,” “Purple and Gold” is also generally misunderstood. People read “Silver and Blue,” and saw indistinctly intricate brush-strokes of blue with elevations in dead white, representing, by way of indication, the high seas by night and in a mist. People hurried to the picture labelled “Ivory and Gold,” expecting to gaze at something like an ancient chryselephantine marvel, or a Florentine masterpiece of splendour belonging to the days of the Medici, and what did they find? The lightly executed sketch of a woman in a yellow and white harmony, in which one looked in vain for the costly materials promised by the title. Not Philistines alone have shaken their heads over this, and evil-disposed critics have talked of hoaxing, foppery, and American bluff. They have wronged the artist bitterly. He was absolutely honest; his optical hyper-sensitiveness felt the colour with so heightened an appreciation of tone that he really saw gold, silver, and purple, where a less susceptible sense could only see dull yellow, deadened white, undecided reddish-brown. In all probability, it was long before he realised that others failed to observe, in the appearance of the actual things and his pictures of them, the rare metals and precious stones, the pearls and ivory, which gleamed from them to him. The common phrase, which is a precipitate of the universal thought and feeling, speaks of sun-gold and moon-silver. Sun and moon consequently make such a strong optical impression on even the average man that he thinks of gold and silver with the accompanying higher notes of ideas of splendour and magnificence. In Whistler’s consciousness, however, these ideas began to be felt with gentle excitations, as whitish foam on dark waves in the night, or a woman’s pale complexion in cream-coloured raiment yielded them. These delicate charms affected his sensitiveness just as the force of the sun or moon affects others. In maniacal excitation, of which the acutest form is madness, the brain of the sick person becomes so supersensitive that it reacts on the ordinary impressions of the senses just as on intolerably violent irritations. Moreover, certain poisons, of which hashish is the best known, derange the central nervous system into a condition of supersensitiveness, in which the person poisoned feels himself inundated with floods of light, and sees a blinding brightness everywhere. The sensitiveness to which only illness or poison raises the average brain, was from nature the peculiarity of Whistler’s sight-centres. He was conscious that in certain respects he had more than others, and he felt as superior to them as the Indian hunter does to a pale face of the towns on a game-beast’s track, which the latter does not notice at all, whilst it gives the former a thousand clear indications. As an artist he was amiably modest, as a man amusingly arrogant. He did not flatter himself on his work, but on his finer organisation, _i.e._, that he was kneaded out of better dough than the majority.

His supersensitiveness is expressed not only in his revel of colour; it is also curiously and graphically revealed in the impressions which he feels of the appearance of women, and which he conveys in his best portraits of women with an intensity no longer restrained within physiological bounds, but positively touching on the morbid. The intensity with which he feels young, high-bred, nervous women has quite an uncanny effect on me. I think of his “Lady Meux,” and other capricious femininities, which were exhibited, in the last fifteen years, in the Paris _salons_ and in London. He plants his model before us in some wonderful position. One stands with its back towards us, but turns its head, as if in a sudden caprice, to us. Another shows us its full face, and looks fascinatingly at us with pinched mouth and impenetrable eyes that think troublous thoughts. These perverted, whimsical beauties wear remarkable and personal toilettes which, except the face and often the hands, reveal not a finger’s breadth of skin, yet, in spite of the interposition of silk and lace, cry out for the fig leaf. They are bundles of sick nerves that, from the crowns of their heads to the tips of their fingers, seem to thrill with Sadic excitement. It is as though they wanted to entice men to wild attempts, and at the same time held their claws ready to tear, with a loud cry of pleasure, the flesh of the daring ones. Everything madly Mænadic, or inexorably Sphinx-like, that Ibsen was incapable of incarnating convincingly in his Hedda Gabler speaks distinctly from Whistler’s female portraits.

They have become typical—typical for copying painters who exaggerate his neurotic women into the pornographic; typical for hysterical women, to whom they suggest poses and psychological states. Félicien Rops perhaps owes him nothing, although often enough his female demons seem Whistler-portraits divested of clothing; he has, from analogous organic hypotheses, independently attained to analogous conceptions of woman; but Zorn’s, Boldini’s, Alexander’s women point to Whistler’s demoniacs. The woman of a given epoch likes to form herself on the ideal which the art and poetry of the time give of the “interesting” woman. Thus Whistler, by means of his female portraits, became an educator of the æsthetically superfine woman of the present day; but Whistler, as an educator of woman, is to me incomparably less sympathetic than Whistler, the delicate appreciator and symphonist of colour.

VIII

GUSTAVE MOREAU

The house in which Gustave Moreau spent the seventy-seven years of his life (1826-98) has been turned into a museum which contains nearly all his life's work, according to the catalogue 1132 items, from the copies and sketches of his youth, through the great finished paintings, down to the promising sketches, unfulfilled promises, of his old age. This collection falls little short of being complete. Perhaps, with the sole exception of the incomparably less interesting Wierz, there is no contemporary artist less often met with in public and private galleries than Gustave Moreau. He never sold his pictures, for he was lucky enough not to be obliged to do so; and, in the time of his maturity, he did not exhibit, for he shunned contact with men who were strange and unfamiliar to him. He who wishes to get to know him must, then, not shirk a pilgrimage to his house, which he inherited from his parents, inhabited by himself, and left as an unencumbered legacy to his native town. And the journey will be found worth the trouble, for Gustave Moreau is a curious phenomenon, affecting to melancholy and depressing, at least for men enamoured with life and action, but nevertheless full of mysterious, strangely pathetic allurement, even for those who prefer to breathe in air and sunshine under a bright sky.

Gustave Moreau stands apart from the mighty procession of French art in the nineteenth century, which was headed by the classic cohort, continued by the powerful band of the knights and squires of romanticism, and then unrolled itself before our eyes, in the legion of the bourgeois National Guard of Philistine academic routine-art, in the blouse-wearing troop of Realists, and, lastly, in the vacillating and oscillating sun-flower groups of Symbolism. He is not to be classed in this line of development. He went his way alone, deaf to the strains of the world of which he heard only those with which he himself was in harmony from the beginning. He had some few kindred spirits among contemporary painters, but he did not know them, and they did not know him either, and they exercised no influence on each other, but grew up independently of one another from the same conditions of like temperaments and peculiar moods that in the middle decades of the nineteenth century dominated narrow, exclusive circles, without being characteristic of this or any other time. For these temperaments are purely subjective, and accord with the external only so far as civilisation, when it has reached a certain grade of intensity and artificiality, always produces men with widely preponderating development of fancy, who are continually looking into their inner selves, and cannot withdraw their eyes from the fascinating spectacle of the wonderful events being enacted therein.

Moreau was just such a visionary. Remote from life, remote from actuality, he ever remained engrossed in his dream, and his noble art served him to retain his apparently multifarious, but, in reality, little changing dream-pictures. His museum is, then, a world by itself, with which the objective outer world has no more in common than have dreams and ravings with pictures of the actual which serve them as a stimulus, and furnish them with the elements of their subjective combinations.

Since the earliest stages of development of the spiritual life there have existed, side by side with men of observation and action, thinkers and dreamers who turn away from actualities, and build up around them a world of ideas which their excessively developed power of imagination could fashion, and endow with romantic life according to their own inclination and necessities. Thus arose all symbols, mythologies, fables, and superstitions that were enshrined in folk-lore, traditions, and, more especially, in all arts. Civilisation brings with it, by this means, besides its recognition of nature, a world of shadows invented by men freely—even if according to fixed psychological laws—like a ghostly double, the astral body of the real world; and our prescriptive education, which comprises in itself more æsthetic than positively scientific ingredients, renders us all double citizens of the real and the imaginary world. The majority of us chiefly live in the former, and visit the latter only in rare moments, which to some mean only recreation, but to others consecration and exaltation. A small minority, however, renounce their citizenship of the actual world and withdraw wholly to the world of imagination, which has been conjured up by the artistic fancy of mankind in thousands of years of creative activity.

Moreau was a citizen of the shadow-world, wherein he spent, an eternal Phæacian Sunday, and he never grew weary of lingering over its beauties. We learn by his representations to know it thoroughly in all its parts. Its landscapes are curiously jagged rocks which seem to be formed of corals; chalk plains with moon-glimmering reflections; mountain steeps in cumulous clouds; lakes and seas of oil, opalescent or charged with indigo. The animals that people this hypnotising paradise are unicorns with silvery coats, amazing dragons that are too curly to inspire fear, milk-white flying-horses, seven-headed hydras standing bolt upright on the tips of their tails, Stymphalian birds with women's faces, sphinxes, chimæras, and phœnixes. Even the flamingos, which come nearest to the terrestrial fauna, are here with the tips of their wings dipped, as it were, in blood, immeasurably more oddly pathetic than we know them. The flora exhibits (besides monumental marvels of Peru, which remind one of the rose windows in Gothic cathedrals) a "mystic blossom," a somewhat calla-like creation that sprouts forth from a luminous rock in the blue, mirroring mere, and on its slender summit, between great high leaves, bears the Blessed Virgin surrounded by a dazzling halo. The spiritual beings that move amidst these marvellous animals and plants, are gods, heroes, and poets: Tyrtæus, Orpheus, Hesiod, Sappho, Jason, Helena,

Odysseus, Penelope, Pasiphae, Hercules, Dejanira, Œdipus, Jupiter, Apollo, the Muses, Semele, Leda, Europa, Prometheus, the Oceanides, Moses, Buddha, Jesus Christ, the Good Samaritan; the acts or, more correctly, the states in which these gods, demigods, and genii are represented are taken from all mythologies and theogonies. Every mysticism that has at any time or place arisen, like a silver haze, from the chaotic brain of man, has found admittance into Moreau's soul and flows up and down in it in changing pictures. As to orthodoxy of any sort or kind, he is quite unconcerned. His mind, when stirred, clings with the same delicacy to the saint of every origin, and he kneels, like the large-hearted heathen of antiquity, at the threshold of the most varied realms of divinity. The Pallas Athene in the hall of the king's palace at Ithaca, who enjoys the massacre of the suitors, is formed after the same type as the Blessed Virgin of the "mystic blossom"; hovering in long, trailing, white garments, radiant with a halo, ecstatic in look and mien and the clasping of her hands. The statues of the Chaldæan gods in the triumph of Alexander the Great imitate hieratic repose, and the Eastern posture of the Buddha-Amina statues. Prometheus on the Caucasian peak, palpitating beneath the vulture's beak, is allied by a family likeness to Christ scourged at the pillar. Jason on the poop of the _Argo_, and the fair man among the "Three Magi from the East," are cast in the same mould. Moses, looking down from the frontier hill on the blue plains of Canaan, and the great Pan, gazing at the spectacle of the procession of the spheres, seem brothers. Jupiter, with Semele on his bosom melting away with its heat, has the unapproachable sublimity of the canonical, the orthodox God the Father. For Moreau there are no dead religions; with a humble shyness and feelings of awe, he approaches all that has ever been reverenced by man.

Moreau's transcendental imaginations necessarily reveal themselves to the senses in other colours, as in other forms than those familiar to us by experience. An eerie light fills his pictures with the shimmering radiance of mother-of-pearl. The rarest, and, therefore, as jewels, the most treasured exceptional forms of the planetary world are the material of which everything in these pictures consists; the buildings are of gold and precious stones; there is a twinkle of rubies, sapphires, and emeralds everywhere. Moreau's amazing art produces from his palette of oil-colours effects that lie far outside its technique; they are huge Limoges plates with rivers of transparent enamel; paintings on glass with sun-illumined, jewel-like fragments of colour; Byzantine mosaics of bits of _lapis lazuli_, jasper, and cornelian. With this palette certain Quattrocentists such as Mantegna, certain Flemish artists as Van Eyck and Roger van der Weyden, as also Holbein, have in their pictures produced a small number of beauty-spots. No one prior to Moreau has painted big pictures entirely with it.

The first impression received from the Moreau Museum is that of having entered an enchanted castle, which has about it something of the treasure cave of the mountain sprites, something of the palace of the Elf-queen, as we know them from the "Thousand and One Nights," and German folk-stories. And if we have tarried longer, and our eyes have grown accustomed to the ripple of pearls and precious stones, of enamel and gold, we are astonished at the strange, weird stiffness and stillness of all these splendid creatures, and really feel we are surrounded by ghosts and spectres that have assumed only in pretence the guise of men.

Moreau formed his views on Baudelaire's rules. In the rooms of his museum we fancy we are looking at a series of book-illustrations for the _Fleurs-du-mal_.

"Je hais le mouvement qui déplace les lignes, Et jamais je ne pleure et jamais je ne ris."

"I hate the movement which displaces the lines, and never do I weep and never laugh" would, as an inscription above the entrance, most fittingly convey in words the main feature of Moreau's art. For nearly all his pictures, but most of all for the "Triumph of Alexander the Great," "Penelope's Suitors," and the "Daughters of Thespius," the verses of the _Paris Dream_ would suit as a deliberate description.

"J'avais banni de ces spectacles Le vègétal irregulier . . . . . Babel d'escaliers et d'arcades, C'était un palais infini, Plein de bassins et de cascades Tombant dans l'or mat ou bruni. . . . . C'étaient des pierres inouies . . . . . Et sur ces mouvantes merveilles Planait.... Un silence d'éternité."

This _silence d'éternité_ is the characteristic of Moreau's art. Here nothing moves; all is as stiff as Lot's wife after she was turned into a pillar of salt, as the men in the fairy-tale after the wizard has, by a wave of his magic wand, made the warm life stagnate in their veins. Moreau succeeds in reversing Pygmalion's miracle. His brush takes the life out of every human body he paints, and turns it into a statue. In none of his figures do we feel that he painted from a model. They all give the impression of being copies from statuary, and we are, for instance, not surprised that his manifestly unfinished "Moses Looking at the Promised Land" has a long bearded head as white as marble on an almost flesh-coloured body. We assume that Moreau has here simply reproduced the natural colour of his stone prototype. Among all his thousand works, one alone has really struck me as having something like a stir

of passion traceable, viz., his “Messalina.” The abominable empress, slave of her animal passions, is ascending the dirty couch at a den in the Suburra. The young vulgarian whom she has beckoned to her clasps her waist with both arms; the attendant torch-bearer of the crowned slut turns her head away from the repulsive sight. One can very well understand the movement of this slave who is ashamed of her mistress, but has only to obey and hold her tongue. The eagerness, too, with which the youth kneeling before the couch creeps up to the body that is offered him, is true and warm. Here is real life, even if in one of its lowest manifestations. But Messalina herself, though the protagonist of this tragedy of Cæsarean madness, is again entirely Moreau. With her stony repose in a situation with which it is so inconsistent, with her Assyrian fish-bladder-eyed profile, she resembles an idol in a Babylonian temple, and one wonders how the passion of the favoured one can endure the icy coldness gleaming from this idol.

His temperament indicated to him, from his earliest awakening to artistic impulse, the course of his education, just as it did, later, the choice of his material. As a youth in Italy he copied Pompeian mural paintings with fervour, and later revelled at the sight of the Quattrocentists. Here he recognised at first sight kindred souls; here, as it were, his blood spoke. He tries, by imitating them piously, to keep them for reminiscences later on. His mystic bent to the old, the obsolete, the risen as from a grave, is a trait connecting him with the Præ-Raphaelites, who were almost his contemporaries. With them he has in common, too, the uncommonly exact and accurate technique. He is a cold but unerring draughtsman. All his accessory work, his architecture, ornaments, implements, and clothing, are marvels of archæological learning or, when this fails, of invention and patiently, painfully achieved execution. His conscientiousness went so far that he painted perhaps twenty or more far advanced sketches of each detail of his large compositions ere he proceeded to the main work, and this, nevertheless, he often left unfinished, because he felt he had not done enough to satisfy his conscience.

Those empty, or merely vaguely filled-in spots instead of faces in big pictures, in which all besides—the patterns of the garment stuffs and carpets, the decorations on the splendid vases, the finery, weapons, capitals of the pillars—are precisely rendered as complete productions, give suddenly to the sympathetic an idea of the pains of this struggling spirit. Moreau shunned life, which was too stormy, noisy, and bustling for his morbid need of repose and quiet, but it did not cease to attract him as a mysterious riddle. He would gladly have understood it, comprehended it, and held it fast, but he had to admit to himself that he was powerless to reach it. A homunculus artificially generated in the retort, he can live only in his glass vessel, and must die if he ventures out of it; but through his prison walls he gazes at the great, broad, free nature, replete with tempestuous life, and in the cold of his glassy den he shudders with longing for this world, so near and yet beyond his reach. His longing is, however, never to be appeased; he will never feel the joys of the warm breath of life.

IX

EUGÈNE CARRIÈRE

How much better off are painters and art-lovers nowadays than in earlier times! Formerly, if you wanted to enjoy a picture you had to own it; if you wished to know a picture you were obliged to make a journey to it. If you liked an artist sufficiently to wish to surround yourself with his chief creations, or the whole of them, you had to have unlimited wealth and set up a gallery of your own. Copies are a mere aid to remembrance, and not a good one either. Executed by a dauber, they are worse than nothing; by a gifted artist, they give the copyist’s, not the original creator’s, personality. The older methods of multiplication also either furnish clumsy attempts at transmitting them, or they are peculiar, independent, artistic creations of another order than painting, which have their special beauty, but are unable to seize the most inward and subtle of the charms the painting possessed.

Since the latest developments of photography and the copying processes dependent on it, the case has been altered. If you would convince yourself of the almost marvellous perfection with which oil-paintings are transferred to paper nowadays, so that every stroke of the brush, however fine, every movement of the painter’s hand, every paste, every unevenness in the colour plane, every effect of the canvas, ground-coating, and varnish, is reproduced in a life-like way, and you have actually before your eyes the whole personal work of the artist, then look at the handsome folio entitled: _L’œuvre de E. Carrière, Texte de Gustave Geffroy_, that has been published in Paris by H. Piazza et Cie., and contains the copy of 150 paintings and sketches by Carrière, 75 of which have been printed on Bristol paper, and 75 incorporated in the text. They lack colour, I admit. Only when photography renders this too, will the last word of genuineness in copying be pronounced. Meanwhile, we must be contented that we find again in the photograph the tonality of the colours and the effects of light and shade in the original relatively graded in respect of each other. With Carrière, however, the absence of colour is really of little importance, for he painted chiefly from a grey and brown palette, which can be very accurately reproduced by means of photography.

A hundred and fifty Carrières! Who could pride himself on possessing such a treasure? One would have to be an American multi-millionaire to enjoy such an æsthetic satisfaction as that. Now it is within the reach of every well-to-do individual. The 150 reproductions comprise about the whole of the great artist's life-work up to now. They disclose to every beholder, who is of good faith and possesses a sensibility for the beauties of painting, the key to the law of art which Carrière laid down for himself. They render it possible to follow the course of his development, which, at the beginning, is hesitating, then becomes decided and weighty, and carries the artist from the school to mastership, from tradition to uncompromising individuality.

Eugène Carrière was born on 17th January 1849, in the village of Gournay (Seine-et-Marne). His father was a Fleming from the north of France; his mother an Alsatian. His appearance corresponds to this probably pure Germanic origin. He is a big, broad man with strong bones and portly stoutness; white-skinned, blue-eyed, and fair-haired; slow of speech, thoughtful and reserved in his movements; dreamy when listening, unintrusive when silent, raising his voice little when saying modest, sensible words about things which he understands. He was still a child when his parents settled in the mother's home. He grew up in Strassburg, and was intended for an artisan. When he was eighteen he went to St Quentin, and had an opportunity of seeing the La Tours in the museum there. His talent was kindled by this unsurpassed, perhaps unequalled master. The beautiful crayon faces of La Tour taught him to feel the velvety splendour of youthful human skin, and meditate on the mystery of the artistic creation of plastic effects through merely intensifying or subduing the play of light. He began to draw and paint eagerly, and aroused sufficient belief in his vocation to be sent to Paris to the Academy of Art. What it offered him was practically nothing. Drawing copies of plaster models chilled him; even the professional life-model in the prescribed studied attitudes seemed to him futile and absurd. What meaning for him had this comedy of gladiatorial positions, ostentatious muscular development, clownish distortions expressive of no natural feeling or rational purpose, in which no human being would, if left to himself, indulge, and which, often enough, the body can assume and retain only by the artificial help of rests and props? What he longed for was life, warm life, such as pulsates in men of strong feelings, and is expressed by them in a straightforward, convincing way by looks and gestures.

The depression produced in him in the pupil-rooms in the _École des Beaux Arts_ made him doubt himself. Luckily for him, amidst his general ill-luck, this spiritual crisis of his coincided with the great crisis of his country. The war broke out, and Carrière hastened as a volunteer to the front. He did his duty bravely in several battles and engagements, was taken prisoner at Sedan, and, as such, reached Dresden. The months of his imprisonment proved decidedly fruitful to him, for he spent his days in the picture gallery, and was shown by the Rubens pictures there, the ways which, up to that time, he had not clearly seen.

After the war was over, he resumed his orthodox studies at the Academy, and became a pupil of Cabanel. It exhibits a good testimony of the power of resistance in his nature that this most inaccurate portrait-painter of the Empire could not influence him, although he had for five years his misleading example before his eyes. In 1876 Carrière competed for the _prix de Rome_. He did not get it. That might have been predicted to him; the prize is the reward of the meritorious industry of the pupil, which flatters the teacher's _amour propre_. Carrière had then, however, emancipated himself from tutelage as an artist. He felt nowise humiliated or cast down by the failure of his purpose. With brave heart he drew from the occurrence the only true moral, viz., that not the approval of teachers, _i.e._, of those who have succeeded, but the satisfaction of his artistic conscience must henceforward be the goal of his efforts. He renounced official recognition, and that was wise, for it preserved him from the pain of disillusion. From 1877 he exhibited annually in the _Salon_, but it was not before 1884 that the prize judges awarded him an "honourable mention," which can hardly, however, be called a reward. A year afterwards, he received the medal of the third class, which is "the last kindness," but at the same time the Baschkirtsew prize of 500 francs, which is awarded, not by the prize-committee, but by the Society of Artists by universal suffrage. In 1887 the Jury rose to the medal of the second class, and, at the Universal Exhibition of 1889, to an insignificant silver medal. With this the series of distinctions vouchsafed to him by the masters of his guild closes. His later honours—the ribbon and rosette of the Legion of Honour, the room reserved for his works at the Universal Exhibition of 1900, the purchase of his "Maternal Love" for the Luxembourg Museum, the commission to paint twelve bays in the Banqueting Hall of the Paris Hotel de Ville—were forced for him from the public authorities by independent opinion. They were the scanty revenue of fame, which the lonely man found when he ceased to seek it. It is characteristic of Carrière that of all the nonsense of medals and decorations there is not a word to be found in the monumental work dedicated to him. They were formerly regarded in France as the great events in the life of an artist. Carrière's proud independence does not admit that they have any meaning at all, or deserve the most casual mention. The book enumerates all his works, even rough drawings, unfinished sketches, attempts at lithography. These are the deeds and events of his life. There is no room in the book for official certificates of industry and his elevation in the _Tchin_.[3] Moreover, Carrière was one of the co-founders of the Salon of the Champ de Mars in 1890, which on principle repudiated the system of rewarding meritorious youths by testing and directing superior officers, and rebelled against turning artists into an hierarchy by means of conventional marks of rank.

Carrière has formed a manner of his own, which he discovered by himself, and asserted it victoriously despite of all kinds of opposition. Every layman sees at the first glance that his pictures are full of grey vapour. A sometimes transparent, at other times thick mist envelops his figures, and makes their different parts stand out with unequal distinctness. “A whim,” exclaims superficiality; “a dodge to astonish,” grumbles the _blasé_ man-of-the-world, who thinks himself cunning. It is neither the one nor the other. The origin of the curious exhalation hovering about his figures is to be sought in his own need for representing the æther in which all planetary life is displayed. His sense of truth took umbrage at the painting in vogue, even that of the masters, which sets beings and objects in space, without giving any suggestion that it is not empty, but filled with a gas possessing optical and kinetic qualities. It is all very well trying, by established toning of the local colours, and blurring of the contour lines, to make the fact perceptible that the figures are surrounded by air; but these customary means of expression failed to satisfy Carrière, and he is not the only one they left dissatisfied. A whole generation of painters, about 1870, had the annoying feeling that air did not get its rights in art, and made obstinate efforts to find a formula for announcing the presence of air with an emphasis that could not be neglected. Sisley, Monet, Pissarro, thought to solve the problem by refraction and iridescent radiation which would render apparent in the painting the visible motion of the air, its vibration under definite relations of illumination and heat. The object is only very imperfectly attained. The attempt is justified, and deserves respect. Carrière sets about the matter differently, in a more direct and _naïve_ way. The decomposition of white light into its spectrum, as the dotters and stipplers practise it, proves, I admit, that the rays of light move in a material medium, as they would otherwise have no reason for resolving themselves into their component parts; but, in order to infer air from the prismatic colours, a man must be a physicist, and it requires a labour of thought that has nothing in common with an immediate impression of the senses, such as must, first and foremost, proceed from an optical work of art. Carrière, then, found even the impressionist rule too learned. He preferred simply to exaggerate, and, as it were, to make palpable, the properties of air, which is neither absolutely colourless nor absolutely transparent. Thus arose the thin grey air in which his figures are bathed, ranging from the most delicate mist to the thickest smoke, but always transparent.

Directly he found his method or manner, it became alive in his hands. In that his peculiarity consists, and in that he shows himself a great artist by the grace of God. Smoke is to him a medium of expression of amazing range. He employs it almost as the engraver on copper of mezzotint does the “burr.” It is a layer of veils which he diminishes or increases as the effect proposed demands. Here he withdraws the covering. There he suffers it partly or entirely to remain, and by such means obtains, by the most natural and, apparently, the least troublesome way, a recession of the non-essential, an amazing relief of the essential, a clearness in the expression of his thought, such as not one of his contemporary painters possesses. At the first glance at a picture of Carrière, one is very forcibly directed to what was important to the painter. One positively cannot wander into what is unimportant, or be diverted from the main thing. It sounds paradoxical, but is literally true: Carrière understood how to make vapour the medium of the highest clearness, to make mystery the gate of an unreserved revelation. That, I admit, his imitators cannot discern in him. It is easy to daub smoke in a picture, but that is not all. Vapour must not be an excuse for bungling draughtsmanship; it must not mercifully cover defects in form. In order not to favour any fraud, it makes a masterly accuracy in modelling a primary condition. To permit oneself such noble economies and condensations one must be as accurate a draughtsman as Carrière. The veiling of the greater part is only, then, admissible, when the lesser left unveiled is perfect.

The subject of Carrière’s portrayal is always life of deep feeling—self-forgetting maternal love, childhood’s gracious innocence, pathetic tenderness of father, brothers, or sisters. He has never worked from the peddling model who can be hired at five francs an hour, and who poses only with the body, not the soul. His model is his own family, with the whole range of idiosyncrasies which their existence by night and day comprises. What the tender husband and father observed with delighted eyes at all hours, that the painter has uniquely fixed on canvas: the mother resting in bed with her baby at her breast; that sweet, shapeless little lump of human flesh which is a wee boy that the elder sister fondles; the children eating or being fed at table; the washing and dressing of the little one, which the mother and elder sister carry out as a pleasant game with a doll; the mother’s anxiety as she cradles the fever-stricken child in her arms, and tries to quiet it; dressing the eldest girl for her confirmation—a prelude to that affecting moment when the mother, with trembling hands and streaming tears, will place the bridal wreath on her head; the pride of the parents when marshalling all their five children in a row; the gloomy seriousness of the tiny school-girl puzzling at the work-table over her first task. Carrière, when painting his family life, painted the life of mankind. His large, epic style of feeling preserved him from falling into _genre_. He remained monumental even when painting details. He is as little sentimental as Goethe in “Hermann und Dorothea”; nevertheless, tears rise when we gaze on his pictures. The incident disappears, and we stand before the Eternal, which it comprises; before Love, which keeps the world together.

The same feature is distinguishable also in his portraits; they ennoble the model by spiritualising it. He gives only just enough of the anatomy to reveal the soul. And when he sets himself greater and more highly differentiated tasks (“The Gallery of the Belleville Theatre,” the “Holy Women at the Foot of the Cross”), he accomplishes them by bringing forth the feelings and thoughts which have brought together the persons concerned, and determine their bearings and movements.

What individual works scattered in exhibitions and museums have not proved to every one is made indisputably clear by the 150 reproductions in the Piazza book, viz., that Carrière is one of the noblest, chastest, most deeply-feeling artists of to-day, who has created for himself a peculiar technique, particularly dangerous for imitators, but natural to himself, and, therefore, in his hand, justified.

SOME OF CARRIÈRE'S PICTURES

“The Belleville Theatre.”—The light, mystic vapour which fills and exhales through Carrière’s pictures, like delicate bluish-white clouds of incense, does not, as a rule, exert a disturbing influence. In this picture, quite one of his most important ones, his brush seems to have betrayed him. He has grown more material than is usual with him. The “Belleville Theatre” is so densely enveloped in smoke that hardly anything can be distinguished amidst the clouds. Yet what splendid discoveries are to be made if you make a violent effort to penetrate the darkness, into which a venture may only be made with a diver’s helmet and an air-pipe! We see—or, rather, we surmise—the third and a part of the fourth gallery of the People’s Theatre. The suburban audience that fills these rows, gives itself unrestrainedly up to the magic of the spectacle. It lives not its own life, but that of the heroes in the piece. To this audience Hecuba is everything. The wide-opened eyes lost in reverie, the cheeks sunk sorrowfully in their hands, the shoulders contracted by fear, the bodies almost helplessly leaning on one another, betray the intensity with which these poor people have fled out of themselves into illusion. What is truth, what is deception, if a poetical word, and that, too, most likely the word of a wretched melodrama, can snatch away small trades-people and artisans—probably sore oppressed by the needs of existence and more than full of their own troubles—so far from all their griefs that they forget their misery and think they are vividly experiencing a new lot? That would be the Buddha philosophy of this amazing picture if we could but distinguish all it contains. Carrière has painted the profound doctrine of Maia and Nirvana. It is a pity he has covered it with so thick a veil that it remains impenetrable even to the eyes of the initiated.

“Christ on the Cross” will give to those capable of feeling the impression of a great, artistic experience. The mystical tragedy, from which a world-religion draws its emotion, is presented with the simplicity and suppressed pain with which a father reports to his son the tragic death of the mother. All subsidiary work that might prove distracting is avoided. No thieves, no Captain Longinus, no Roman legionaries, no fanatical spectators; not one of the aids in men or things with which the classics of painting are wont to complicate the event of Calvary, with the object of making it more impressive. Nothing save the life-sized figure of the Saviour, who has ended His sufferings, and Mary, who leans against the Cross so as not to break down altogether. On the face of the corpse the peace of consummation has sunk; unutterable grief wastes that of the Mother. The form floats in a soft, unearthly light; on the latter expressive shadows strive. The repose of the dead Christ, which would appear painless and almost cheerful were it not that a slight trait of suffering was fixed around the mouth, dawns like a consolation over the dark despair which fills the soul of the living mother. If she suffers humanly, as a mother, so that she would fain die of woe, still redemption and exaltation also arise for her from the act of salvation. If one has ever heard Palestrina’s “Stabat Mater,” it re-echoes in his soul at the sight of Carrière’s picture. It has issued from the same deep emotion as the tear-soaked _terzine_ of Jacopone da Todi and Palestrina’s sobbing hymn. Carrière abandons himself to his feelings with the same earnestness as the Franciscan friar and the choirmaster of St Peter’s. It is hard for me to admit that he shares their pious belief. I assume that the Mother’s grief has, in the main, inspired him. This strong feeling has, doubtless, made him susceptible of the sacredness of the symbolism in the death on the Cross; through the human he will have raised himself to an inkling of the superhuman. Let us not forget that Carrière is the painter of that “Motherhood,” the gem of the Luxembourg Museum, which depicts a young mother with a child on her lap and another beside her, revelling in the sight of her little ones—her treasures—with adorable tenderness in look and mien, in the pose of her body and the movement of her arms. Carrière has a wonderfully deep feeling for maternal love, in joy as in sorrow. Unconsciously and involuntarily, he has conceived his subject not with the spirit of a believing Christian, but with the broken heart of Mary. He might confidently have called his “Christ on the Cross,” too, “Maternity,” like his masterpiece in the Luxembourg; the one is a companion-picture of the other; the tragedy of maternal love, according to its idyl.[4]

There were cases in which the employment of Carrière’s plan of the delicate grey veil of enveloping mist was not successful. I have, for instance, been obliged to make reservations in respect of his “Theatre in Belleville.” In the “Christ on the Cross” it is

organically developed from the subject. The veil of mist shrouds the incident in the weird twilight which is the prescribed atmosphere of miracle and the mysteries of faith. Beyond the figures in the foreground of the Crucified and the Blessed Virgin we divine, in the semi-dark distance, a great city, at the back of which, on the horizon, a twinkling white light, like the still uncertain brightness of a young dawning day, arises. Our powers of imagination may fill with life the whole of this profound space wherein dawn is at odds with night—with the life of a whole townsfolk enjoying their revenge or weeping for woe, oppressed with foreboding or hopefully confident.

Here is symbolism in that high sense in which every true work of art is symbolic. The picture is at the same time intellectual and transcendental; the rationalistic beholder, who neither seeks nor wishes to find a mystery, has before him the humanly affecting drama of the mother who bewails her son who has died unmistakably in a noble task. He sees sights he can understand—the peace of death and a mother's deepest pain—presented with unsurpassable truth. He enjoys the charm of perfect form, marvellous warmth of colour, produced with the simple means of _gouache_ toning and a very faint heightening by touches of red, and an extremely interesting distribution of soft light glimmering from the dark background. The mystically minded beholder sees all this, and he sees, besides, the divine element in the Crucifixion and the sorrow-stricken Mother, the terribly threatening subversion of the natural order in the darkness brooding over the city and fields, and the promise in the light arising in the distance. What the rationalist sees in the work of art is sufficient to arouse his feeling and admiration. The mystic's wonder and feeling will be powerfully strengthened by religious emotion.

"Portrait of my Wife."—He who is guilty of the error of confounding gaudiness with coloration might find a guide in this work. A few bright tones in the spiritualised, almost transparent face; a fur collar of a warm, rich brown; a gay, red flower in the girdle, comprise all that Carrière employs as colour media, in order to conjure up a harmony of lulling melody and, at the same time, of all but hypnotising intensity. That is precisely the whole mystery; it is not a question of the noise, but of the harmony. Three colour values, chosen with exquisite taste, placed on the right spot in the floating white and pearl-grey cloud which constitutes Carrière's manner, and the impression of the colour mystery is produced with greater success and depth than by a palette on which all the seven colours of the rainbow are keeping a witch's festival.

"The Kiss before Going to Sleep."—A painting of marvellous range of feeling. A mother with her daughters, from the grown-up one to the suckling infant at her breast. The big girl bends over her mother's shoulder, as the latter is sitting, and takes her good-night kiss from the lips of the head turned to her. The baby has fallen asleep whilst feeding at the maternal bosom. The third, half-grown-up, has likewise been overcome by sleep, as she leans helplessly, with her whole weight, on her mother. The last twines her fondling fingers in her mother's hand outstretched to her. The mother is the central point of the picture. From her gushes the force that penetrates, encompasses, attracts, and holds together the rest of the figures. Love it is which collects these beings and unites them in a marvellous circle. Thus they become a symbol of the force that has built up the universe itself, and keeps it in its eternal order. And this self-same love, which knits these hands in each other, bends these bodies to each other, brings these lips together, which is visibly the motive and attractive force, in all these simple but incomparably eloquent lines of movement, has also guided the magic brush capable of expressing so great a theme. He who at the sight of this lofty work does not feel all the hardness in him melting in joy stands outside humanity. Moreover, there is not a trace of declamation, or purpose, or _tremolo_ in its execution; no prettily pietistic rhetoric. Not a single adjective, but only neuter substantives, as in Roman inscriptions. That is precisely the receipt, which holds good in all times and in all places, for monumental works: eternal feelings expressed in eternal forms.

"The Engaged Couple," like "Maternity," like his portraits of a married couple, a young maiden, etc., etc., are unapproachable works. His grasp of the essential in phenomena, his economy of form, are of supreme craftsmanship. It is in this direction, I think, that the future development of painting lies. It will soon be over with mere transcription of nature, however clever; certainly, on the not very distant day when colour photography will be handed over from the experimental laboratory of the physicist, to professional use. Then the individual standpoints of observation will alone hold good. People will want views, not as the mechanically reproducing, dead object-glass, but as the inspired eye of the artist sees them. Pictures will have to be a selection, an interpretation, an emotional excavation of the optic phenomenon; every picture an anthology of vision; and the personality of the artist revealing himself in it, will be the fascination of his work, its value and its beauty. Let no one say: "These are trivialities. It has always been so since plastic art existed." The plastic artist was hitherto always in the first place a depictor. His soul revealed itself only discreetly in his works. Carrière goes far beyond what he sees: he paints souls; he paints feelings. In his representation the inexpressible becomes an incident. A fugitive movement, a pose, a line of head, neck, shoulders, or hand in which unconsciousness is manifested, when self-control is relaxed for a moment; these treacherous means of expressing mood, which

the will is not always able to influence—these are the elements with which he works. He discloses the impulses, up to their most delicate moods, which are the causes of movements and deportment. To such a spiritual art must painting be developed. And this is why I call Carrière's pictures the art of the future.

X

PUVIS DE CHAVANNES

Puvis de Chavannes is dead, and his influence is dying; his School is desolate, and I see now hardly any stragglers worrying themselves to paint with his palette of pale moonlight. So it is no longer necessary to attack him. It is enough to explain his spiritual transformation and his successes.

When he attained the maturity of his powers, that Naturalism was the trump-card in painting, of which Bastian Lepage's abominable "Reaper," whose brutalised grimace grins at the visitor to the Luxembourg Museum, was admired as the highest achievement. The young critic had eyes only for this art. The multitude dared not question the fulsome praise squandered on the works of the naturalists; but their inner voice was not mute. They had qualms of conscience about their culpable cowardice, and were quite well aware that naturalism, which was lauded to them as Progress and the Future, was in reality the negation of all art. Then Puvis de Chavannes stepped forward with his big wall-paintings, which put symbolism, sacred legend, and history on the stage, on a literary background, and reunited them to tradition, which had been disowned or scoffed at by naturalism, out of barbaric ignorance or vulgar arrogance. The multitude, whose inward feelings partisan criticism outraged, turned forthwith to the painter who seemed to them a deliverer and an avenger. He was a living protest against the art of the vulgar, the hideous, and the commonplace; against the art of the mechanically dull copying of a soulless reality. He took pains to serve beauty. He showed unmistakably the object of his spiritualising his figures and actions. Before his pictures one could once more dream. After prose, after vulgar, slangy prose, it was verse. People did not even ask if the verses were good; people were satisfied with mediocre verses, provided they were verses. To Puvis de Chavannes his fundamental, academic instincts had given the direction; but whilst he followed his bent, he became, without intending it, and without previously knowing it, the file-leader of the right-about turn, which began in "the 'eighties" and has now long ended.

In a period of idealism he would have been one of the many. People would not have noticed him or would have found in him much to take exception to: the banality of his symbols, the impersonality, smoothness, and polish of his draughtsmanship, the intentional incoherence of his compositions. During the predominance of naturalism, his academic banality itself seemed a courageous act, and seekers after the ideal even accounted his most obvious faults and weaknesses as excellencies in him.

He got his faded, spectral colours by imitating the fresco painters of the Quattrocentro. His ideal of picturesque beauty united in inseparable association the stateliness of the old monumental wall-paintings with their fadedness; and when he wished to paint in their style and produce their æsthetic effects, he at once gave his pictures the faint coloration which had never been intended by the Quattrocentists, but which their works have suffered through the devastating force of five centuries. The obliterated, remote, ghostly qualities of this faded type of painting came to meet a morbid mood of the time. This mystic coloration harmonised with the prevalent mysticism. The decadents were thankful to him for his moon-stricken colouring; those athirst for beauty for his conversion to classical tradition; and so he became a great man through the sins of the naturalists and their critical heralds.

Puvis was the first academical and recognised master in France who began to paint the morbid. His whim is chalk-wash. He covers, on principle, his pictures with a white, semi-transparent broth that extinguishes all the colours. His eye detests colour. His glance has a sort of chloridising effect; it takes the colour out of everything it ranges over. With him, however, morbidity is natural and not an affectation. He has that horror of all that is loud, full, and impressive, which marks the nervous man, whom every rough touch pains. It is well with him only when nature whispers, when her looks are veiled in a fine mist, when all life in her is motionless. In his soul reigns a melancholy absence of sound, and he likes to carry this into the outer world also. Moreover, the multiplicity of living forms confuses and repels him; it is too full of motion and gaudiness. He simplifies, therefore, all lines which thus lose their distinctive individuality. He retains only what is typical of the phenomenon; he infuses his style into all that his brush and pencil touch, and this cold stylisation is then called by people his "idealism."

Has Puvis laid himself open to the reproach that all his figures are awkwardly typical because he cannot draw? We might almost think so. It is only as a reply to such a reproach that we can understand his exhibiting in 1896 several hundred drawings, preliminary studies for all his chief works. After a minute inspection of these smaller and greater sheets of sketches scarcely

indicated or industriously executed, of figures scarcely outlined or carefully shaded in lead-pencil, Indian ink, red and other coloured chalks, we are bound to feel every respect for his industry and conscientiousness. For the originality of his talent, too? That to me is questionable. If I gaze on the studies of Leonardo and Albrecht Dürer, I am, in a very short time, over-mastered by an inexpressible emotion. A holy of holies is revealed: the most secret feelings of an artist's soul which would fain become conscious of itself whilst seeking to give shape to the emotion that is urging it. You can see the struggle with the resistance of the material, the mustering of all his forces, in the majority of cases the artist's victory, ofttimes his despairing confession of impotence. A feature of the phenomenon—a fugitive yet expressive movement has made its impression on the artist. He hastens to fix his conception. At first in a few hasty strokes, which are then strengthened, deepened, emphasised, and developed. Five times, ten times, till the artist desists disheartened, or till the vision is overcome and fixed by a spell in its whole force and verity, in its distinctive character that is never to be repeated. In Puvis I observed with astonishment the contrary process. The first sketch has always the greatest individuality, every later state of the figure shows it less differentiated, and more reduced to an average type lacking expression. He never ascends, he goes down. The artist's emotion in face of the phenomenon—the impulse to produce in the rapture of an intuition is never traceable in him. None of the sheets is the arena of that awful fight waged by talent against the hostile demon of the material, which reminds me of the night-long struggle of Jacob with the spectre at the ford Jabbok. The starting-point of the work is correct, ice-cold _métier_. It progresses to simplifications that are just so many evasions of difficulties, and it finally arrives at insignificant puppets. "That was intentional," cry the painter's eulogists. So much the worse if it was intentional. But was it really intentional? That is the question. Often enough, as an afterthought, a person imagines he is exercising volition, whilst, as a matter of fact, he is constrained. For him who has learnt to see in all works documents bearing on their creator's psychology, the drawings of Puvis are proof positive that this highly famous man never glanced at the world with an artist's eye, but that he was originally a cold, academical technician, who, later on, by pure reason and without attaining the slightest fervour, has subtilised a peculiarity: the imitation of faded frescoes in colour, archaic indifferentiation in drawing, abstract literary symbolism in his subjects.

In fact, what is unreal and dream-like about his vision is not only determinative in regard to his archaically simple, almost poor drawing and his pallid colour, but also the choice of his subject. He likes best to portray allegories, in which the figures are reduced to the _rôle_ of symbols. When he cannot be allegorical, in his famous wall-paintings at the Pantheon, for instance, which tell the legend of St Géneviève, he satisfies his craving for spectre painting by spiritualising the given historical figures into fleshless, bloodless denizens of the ballad of the land of Thule. In individual and very rare instances, he finds a material organically suitable for his moon-struck style of painting. In such cases, of course, he strives after extraordinary effects; for instance, with his "Poor Fisherman" in the Luxembourg Museum. This dreadfully poor, emaciated man—more a shadow than a human being—who, sorrowfully but resigned, stands in his old patched boat, drops his wretched net into the sluggish, greyish-yellow water, and is surrounded and, as it were, fixed by the dead lines of a flat melancholy landscape, breathes a disconsolateness and abandonment that, at the sight of him, "humanity's whole sorrow" seizes the beholder.

Once again, in his last period, Puvis lighted on one of those rare subjects which not only bear, but demand his peculiar methods of execution, and out of this lucky encounter came forth a masterpiece, viz., the fresco which concludes his Géneviève cycle.

St Géneviève has stepped out of her cell on to the balcony of her convent and lets her glance roam over Paris. At her feet lies the slumbering city; in the foreground surge the red-tiled roofs, between which soar a few tree-tops in the luxuriant verdure of midsummer; in the distance stretch the soft hill lines of a cheerful landscape, the green of whose meadows is interrupted, here and there, by the white mass of a convent or abbey. Slender lilies and _gladioli_ bloom in noble vessels on the balcony. In the bare cell, the door of which is wide open behind the saint, the smoking flame of a lamp of antique pattern smoulders. At the summit, in a deep blue sky, hangs the full moon, which softly illumines city and landscape, and casts an eerie gleam on the curled leafage of the tree-tops. Immersed and bathed in its soft radiance, the saint stands there, unearthly with her thin, ascetic countenance and her white nun's habit, which from her headcloth to the trailing hem of her garment flows down in unbroken, perpendicular lines, and seems to lift up her soul in a quiet, ecstatic prayer for the slumbering town, whose peaceful prosperity is a work of her solicitous love. Here Puvis's peculiar method triumphs in every feature. Here his temperament needed only to give itself its natural scope to attain the highest artistic result. What elsewhere is intolerable affectation becomes here the honest revelation of a mood. The subdued harmony of violet and blue in different gradations of intensity that blend softly into one another is legitimate in the picture of a summer night, which takes its sole spectral light from the moon and an oil-lamp. The paleness of the flesh is understandable in the aging nun who mortifies herself by prayer, vigils, and fasting. The simplicity of the drawing, which is reduced to a few straight and slightly though expressively curved lines, finds its defence in the dusk of the semi-transparent night which suppresses all individualities of forms; and leaves only for us general, essential features, and these rather surmised than clearly seen. Thus here a special subject finds its special and fully adequate means of expression, and the work becomes a model of what is termed style in

the highest sense.

A rejuvenation seemed to come over Puvis when he seized once more on the Géneviève theme which had occupied him from the days of his youth. This theme was to him what the theme of Faust was to Goethe: while the octogenarian was engrossed in it, something of the flame that glowed in the young man of twenty fired him, and the last cry of _Una pænitentium_[5] is still an after-thrill of Gretchen's passion. Puvis, too, appears to have thought or felt "_Ihr naht euch wieder, schwankende Gestalten!_" when he set about painting this concluding picture of the Géneviève cycle; and for the last strophe of his ballad, which dies away so sadly, he found again some of the power and unction which secures to its predecessors their glorious place in the century's Art.

If the brazen foreheads of the babblers who have the chief say in the art criticism of the time were at all capable of a decent blush, they would turn red with shame at his series of frescoes in the Pantheon. People had the audacity to claim Puvis for some "modernity" or other, in which certain moods of our time were said to be incorporated. The only time when one can wholly surrender oneself to him, he is absolutely of no time. What, in that instance, fascinates in him is nothing relating to the present, and still less to the future, but the past and the remote past, the atavistic. His life's great work is a legend of a saint, which he has treated after the manner of a legend with the feelings of a primitive who, in the manner natural to him—the manner of about the fourteenth century—tells a story that is to him a living verity, in which he believes, as those souls believe it for whose edification he presents it, and which moves and touches him as it does the beholders who will fold their hands devoutly before his work. Puvis cannot reckon on such a reception from his contemporaries, for whom he designs his creation. To us the legend is strange; it is a bit of learned literature which we look at critically, and in which we cannot be expected to plunge believingly. If Puvis, nevertheless, overcomes our opposition, and can suggest to us for moments the child-like faith and all the emotions of dead and gone times that are connected with that faith, he has achieved something more difficult than the primitives, for whom the spirit of their time was no opponent, but a confederate.

Blessed are the ignorant. Their lack of suspicion secures them, whenever they glance at the world, the enthusiasm of discovery and invention, and every phenomenon delights them as something unprecedented. During the lifetime of Puvis de Chavannes his peculiar style was particularly extolled by his eulogists. They exhibited him as a God-sent foundling; as a Moses of painting, without ancestors, himself an ancestor; as a great solitary wandering apart from the multitude through the history of contemporary art. Such phrases can be uttered only by one who rejoices in the most refreshing ignorance of the historical continuity of things. Puvis is of a family. The expert can name his forefathers and relations; he finds their lineaments repeated—often coarsened and disfigured—in him.

Puvis, this great, original genius of his admirers, is an impoverished descendant of Cornelius. He represents the worst aberration in art that this century has seen, viz., thought-painting. Nowadays it is no longer necessary to prove that abstraction is the negation and abrogation of plastic art. This maxim, fortunately, has become an æsthetic commonplace. Painting has to do only with sensuous phenomena; abstraction distils from the sensuous one quality, which, since it is common to many phenomena, is reminiscent of many phenomena, yet is itself not phenomenon. He who feels the impulse to paint not views but thoughts, proves that in his innermost soul he is not a painter, but a rhetorician, and that he has deceived himself marvellously as to the method of expression natural and organic to him. Cornelius's painting presented thoughts, religious, philosophical, and historical dogmas, in a picture-language considerably less clearly than might have been done in well-ordered words. It pleased all those whose soul was seven times sealed against understanding what really constitutes painting. As long as the Cornelius tendency was dominant in Germany, that country was depressingly behind in the art life of the period. As soon as Cornelius and his school were overthrown, a sound development of German painting began. And now, at the close of the nineteenth century in France, in the France which has produced, in landscape, Corot, Rousseau, Diaz, Harpignies: in figure-painting, Millet, Courbet, Bonnat, Roll: from which has come the return to nature and the renaissance of art, the allegorical thought-painting of a Puvis has been praised as the greatest advance, as the latest step in development! The snake biting its own tail still remains the truest symbol of human activity that the self-knowledge of the race has as yet discovered.

And how far, in his special direction, Puvis lags behind his obsolete predecessors! A Cornelius, Kaulbach, and Stilke, displayed, after all, in the invention of their symbols, a rich power of imagination which might have been worthy of better things. Their two-legged abstractions were so honestly drawn that they deceived with regard to their phantom-like nature, and could give themselves out to be real creatures of flesh and blood. Puvis's invention, on the other hand, is so poor that it whines pitifully for alms. The representations which kindle his imagination seem derived solely from an illustrated handbook of mythology for girls' schools. For an example of this, one has only to look at the wall-paintings for the Boston Library, which are among the most important work that Puvis has done, at least so far as their range and claims are concerned. The first represents the inspiring

Muses “greeting with acclamations light carrying the Genius.” From a schematic landscape with sickly pale meadows, a sea of ultramarine blue, and spanned by a sky the colour of autumn foliage, nine female figures are flying to meet a delightfully insignificant naked youth striding on clouds of wadding. This youth holds in each hand a powerfully brilliant electrical lamp, evidently the Teslasch alternating current light, as wires are nowhere visible. The least fault of this picture is that the Muses are not aspiring in voluntary, independent flight, but hang motionless in the air in a passive attitude, like Giotto’s angels and saints, who have not yet learnt to fly. Its mortal sin is that it wishes to represent in painting a vulgar, rhetorical arrangement composed of a number of abstractions.

Beside this allegory, Puvis opens five windows on his world of dreams. Naked shepherds observe, in a southern night, the course of the stars, and are themselves observed by a young woman who is creeping out of a lowly leafy hut. A man in a sort of Roman dress looks thoughtfully at some bee-hives, whilst peasants in the distance are busy working in the fields. A greybeard is sitting by the sea, from which a steep cliff emerges. On its summit a man is chained almost in the attitude of the Crucified. The shadow of an approaching vulture falls on him. Maidens emerging from the sea hover round him with disconsolate gestures. We must necessarily recognise Prometheus and the Oceanides in the scene. Another old man, who is blind, receives laurel branches from two young beauties. A haughty dame stretches her arm with magic gestures over a mysterious abyss that has engulfed mighty marble buildings, pillars, and woodwork. Behind the woman stands a youth with a torch and book in his hand. I have described in brief what one actually sees. Puvis means the star-gazers for Chaldæan shepherds; the Roman for Vergil; the greybeard in front of the Prometheus-rocks for Æschylus; the blind man for Homer receiving the laurels from the hands of the Iliad and Odyssey personified; the enchantress for history conjuring up the past. We are to read still more into it. The Chaldæans signify astronomy; Vergil bucolic poetry, Æschylus dramatic, Homer epic; the conjurer up of the dead and ruined, Clio. Thus we have before us five polished planes of the prism of man’s spiritual activity, five domains of the Muses—a fitting decoration for a library. These abstractions are painted in an abstract style. The human beings are schematic drawings as if taken from statues for illustrating an academic canon. They live psychically only through their artificial gestures—not through their mask—visages without mien of glance. The landscapes are geometrical combinations of rocks which a Cyclopean stone-mason has hewn in ancient style; of mountains whose ridge stretches in architectural lines; of evenly-coloured masses of deep-blue sea, pale-green sky, and sap-green grass country. The land is called Utopia, and is inhabited by Outis: in English, Nowhere and Nobody. The indigo, emerald, and turquoise tone is pleasant to the eye, especially as Puvis has here, contrary to his murderous habit, not massacred the living colours. But nothing except the harmony of colours appeals to me in these pictures. It is not painting: it is writing. It does not presuppose in me any feeling for art, but only a decent, classical education. It taps on my school satchel. Before these five Puvis de Chavannes pictures, I think of a highly-educated Japanese, learned in all the wisdom of his country, with the most delicate feelings for line and harmony of colours; an appreciator of Hokusai and the other great masters of Japan: he will receive no impression at all from Puvis’s works; he will look upon the figures as phantoms, the scenes as so much childishness; he will not have an inkling what these forms, remotely resembling human beings, are doing, or what they mean. For he is not acquainted with the Greek and Latin classics, and without this hypothesis the works of Puvis are dead symbols, incomprehensible to any one unprovided with the special key, and without the natural constraining power of plain human truth and beauty. The provoking over-estimation of his work by corybantic critics justified every severity against Puvis de Chavannes in his lifetime. Now his appreciation no longer requires polemical pricks, and we can say that his Géneviève cycle secures him a permanent place in the history of art; that his great allegorical frescoes are cold, dead, sprawling, pretentious subtleties; and that neither his drawing nor his colour sanctify him as a master and model. His importance consists in this, _i.e._, that in his time the longing for beauty took him as a cloak for a passionate confession. The Puvis cult was, in the main, a reaction against Realism. By the exaggeration with which he was honoured may be measured the greatness of the disgust which his contemporaries felt for naturalistic art.

XI

BRIGHT AND DARK PAINTING

CHARLES COTTET

A generation ago opposition arose against gloomy painting. Down with the twilight cellar painting! Down with the studio sauce! Hurrah for the open air! Long live free light! With this war-song a brave, hot-blooded band stormed art academies and studios of masters, and, shouting for joy, planted their silver and violet banner on the posts they had taken. For two whole decades the art exhibitions presented a cheerful, festive aspect. It was always Sunday. The glow of a southern noon rested over whole walls. From the hundreds and thousands of canvases, big and little, streamed the gleaming sunlight in its full glory. Men, beasts, things,

landscapes—all swam in luminous splendour which, at most, patches of violet shadow subdued timidly. Nature seemed to know no other conditions of light than those of Capri in July. About the turn of the century this suddenly began to change. In some pictures the light went out. Certain painters again discovered the darkness of evening, of leaden-clouded winter's day, of thickets, of rooms. On some palettes the eternal white and violet was replaced by the old brown, black, and olive-green of our fathers. The phenomenon became, year by year, more marked. To-day the change is accomplished. Free light is thrown away after the old moons. Painting has grown sick of noonday. There is an atmosphere of twilight in all the pictures. The young painters—the victors of the day—use as much asphalt, mummy, and umber, as did the old ones thirty years ago. Whole ranges of walls in the Paris _salons_ lie as in deep shadow, and we may go through several rooms before finding a creature represented as "breathing in rosy light."

What satires these _salons_ are on the consequential, high-stepping, deep-thinking drivel of professorial and other chatterers, who, to hide their dearth of thoughts, turn out new words, discover in our days a particular "charm" in painting as in other arts, and prove by _a_ + _b_ the necessary, logically offered expression of new spiritual needs of the present generation.

Now what has become of the "charm" that calculatingly demanded "free light" and nothing else? And how is it, then, with the spiritual needs of the present generation, to which free light and nothing else corresponded? And how does it stand with the new way, in which favoured artists have taught us to contemplate and to feel nature? Was the "charm" four or five years ago inclined to brilliancy, and is it changed during the night to an insatiable longing for gloom? Did white and violet correspond five years ago to the spiritual needs of the present generation, and does this generation now need black, brown, or olive-green tones? Have we just as quickly again unlearnt to contemplate and feel nature in sun-gold and violet, as favoured artists have taught us to do?

Living art goes her way according to her own laws and impulses, and leaves in the lurch the babbling empty heads, with their pretentious threshing of phrases, who tramp after her, expounding and talking wisely interpretations and clever chatter. Not by a particular "incentive" of the period, not from its alleged spiritual needs and currents of thought, are the changes of art creation to be explained, but solely by the psychology of the artists, by their very human, very weakly prosaic needs, by the material and moral conditions under which they are nowadays condemned to work.

The _salons_, the art exhibitions, are in our time the annual marts of success for painters. In these they have to seek fame and its train-bearer—payment in cash. In these they must strive amongst a thousand or two thousand competitors to astonish at any price. By special beauty or special nobility? This means will be chosen by the very fewest. Firstly, not one in a thousand has it in his power. In the second place, even an artist not in the front rank has enough Philistine contempt to be convinced that nobility and beauty are the last things for which the crowd has a taste. His hunger for success—a fitting form of his instinct for self-preservation—gives the artist sense and understanding of the psychology of the multitude, whose elementary law is that it is obtuse to that which is common and reacts on what is uncommon. The artist who works with an eye to exhibiting where his work will be one of two thousand, has only one endeavour, viz., to be as different as possible from these, and by this means possibly to make a striking impression amongst them. The contrary is the greatest difference possible. That is the polar line, the angle of 180 degrees. Logic, which unconsciously proceeds geometrically, brings the artist to this. He also looks sharply at what the others are doing; puts himself to trouble to find out what they have in common, and in what respect they resemble each other; and when he has discovered this, or thinks he has done so, he proceeds to do the exact reverse.

If he has properly recognised the predominating element and has hit the exact opposite, the victory is gained with a weight that overthrows all before it. Professional associates, critics, and public stand in front of something new. The novelty-hating majority feels the disturbance in their lazy mental habits as an insult and discomfort, and sets up a yell. The minority of unsatisfied gainsayers, morbid bread-hunters, vain coxcombs, and enthusiasts longing for the glorious Unknown and Unprecedented, passionately take side for the novelty. This serves as an excuse for a conflict of those eternal conservative and radical tendencies, whose battle may be seen throughout the whole history of human development; and the artist who unchains these tempests sees himself honoured as one of the embodiments of contemporary thought, as a power in civilisation. Only quite exceptionally is a cool analyst found to say with smiling tranquillity amidst the bluster of the war of minds: "Dear children, don't excite yourselves like that; the word 'new' is no verdict. To be different does not necessarily mean to be better. An old tendency may contain beauty in itself; a new one may, of course, do so too, but not necessarily. He who grows excited on behalf of the old, simply because it is old, is commonplace. He who grows excited for the sake of something new, merely because it is new, is commonplace with a negative prefix. Only wait a little while. In a short space of time the new will have become old, and you will recognise that there was no grounds for raising a noise about it. The man of the new thing, whom you hail as the bringer of a new salvation, is no better than the ancients; but he is right, for he wishes to be noticed, to inherit from the ancients, and that is wholly justified from his selfish

standpoint."

The would-be aristocrats of intelligence—the "intellectuals"—would find a speech like this intolerably homely. It is not in the least "deep." It is not at all applicable to the mystic inclinations of vaporous brains. It discovers no single unsurmised and astounding relation between phenomena that have nothing in common with each other; but I believe it is literally true.

The "Impressionists" of the Caillebotte room in the Luxembourg painted brightly when the _salon_ was correspondingly dark. The one light picture among the dark paintings acted like a window that opens in the gloomy wall to the sunny air. When the other painters saw that the multitude flew towards this bright point, like moths after the flame of a taper, they hastened to paint also in bright colours. "Free light" was discovered. It corresponded to no mood of the period. Free light is joyous and satisfied. The spirit of the age was, during its predominance in painting, pessimistic and sick with longing as it had hardly ever been in the past. Nor was it a new way of seeing and feeling nature. Turner, Corot, Claude Lorrain, Ostade, Salvator Rosa himself had seen and felt nature quite as brightly as Manet and Monet had done. The truth is that the "Impressionists" were turbulent young people who got angry at vegetating in obscurity whilst Gudin and Schnetz, Signol and Müller, Pils, Cabanel, Dubufe, and Robert Fleury had all the honours and successes; and that impelled by envious loathing of these celebrities of that day, they found, as it were, in a negative chemo-tropical way, the exact reverse of their dark style.

Five years ago the same incident was played off exactly in the opposite direction. Everybody was painting in a bright style. The Schnetz and Cabanel, Delaunay and Cogniet of the day were called Puvis de Chavannes and Roll, Besnard and Cazin. Then, again, some young people got angry about their being unknown and unheeded, and they entered, consciously and of set purpose, into opposition against the celebrities of the day. Charles Cottet exhibited a black picture which, in the middle of a blinding white exhibition wall, struck just as glaringly as did, thirty years ago, the bright picture in the middle of the black wall. Cottet had hit the bull's eye. He instantly created a school, and to-day the _salons_ look once more as they did thirty years ago, to be once more flooded with free light, probably, some twenty or thirty years hence. It is an orbit without beginning or end, an eternal beginning over again, and only posing fools seek, in this monotonous, periodical return of the same effects under the influence of the same causes, to ferret out connections with definite phenomena of the times.

Charles Cottet is developing into the undisputed leader of the young race of painters. He deserves the recognition accorded to him, yet it is a serious matter that he provokes to imitation; for what in him is uncouth, though justifiable, independence, will become with the imitators a manner that may rapidly pass into intolerable aberration. Cottet loves dark harmonies of colour. He paints night, closed rooms illumined by artificial light, candle and fire effects; unlike Rembrandt, whose glooms are delicate and transparent, whose men and things are particularly self-luminous in sunless space; and unlike his pupil, Schalcken, who treats flames and their reflections roughly after the manner of a blacksmith, without mystery or harmony. Cottet paints it apparently more from joy in darkness than joy in light, for with him darkness is generally the principal thing, and the sources of light are there chiefly to call attention to the sinister stir and movement in the unillumined dusk. His imitators do not see the intense life of his shadows. They only see his black, brown, and dark-green palette, and dimly brush away at it again as in the worst days before the dawn of "free light."

Painting goes out into the night, and will remain there a while. Then once more a cheerful and free artist will come, and discover light for an astonished and enraptured world, and he will be deified or damned as a revolutionist just as Monet was thirty-five years ago when he did the same, and as Cottet was five years ago when he did the reverse. And thus it will ever be so long as in the human apparatus of thought a change of impression will relax conscious feeling, and art creation will have to serve, not only the utterance of strong impulses of emotion and the relaxation of the nervous system, but also the ambition or vanity of the artist, which means, I suppose, to the end of time.

Cottet's execution is somewhat brutal. He works in the style of Ribot, who was himself a curious mixture of reminiscences of Franz Hals, Ribera, and Velasquez, with an admixture of personal self-will. He lays great, dark, almost dirty spots on the canvas, and treats human skin with boorish coarseness—I might almost say, with the curry-comb. But what truth and energy in all the movements! How economically and yet how exhaustively he can reveal the thoughts and feelings of his subject. There is little in the whole of modern painting so pathetic as his three-panelled picture, "Sea Folk," that now adorns the Luxembourg Museum. In the middle, the parting meal of the Jack Tars before starting, round the village table fifteen people, strapping young men with their womenfolk—mothers, wives, and sweethearts. Through the open window dark-green night looks in; from the petroleum lamp there gleams a sharp streak of yellow light; the men sit close to each other in silence; forebodings and the sadness of leave-taking exalt them and raise the souls of these horny-handed toilers to the regions of poetic thought and dreams. On the right, the boat that is

conveying the sailors to their ship; some are rowing or steering, the rest are in a reverie. All go carelessly to meet their fate, which perhaps will mean merely prosaic seaman's work on a voyage without any adventures, but perhaps even heroic tragedies of struggle and destruction. On the left, the women remaining behind, who watch from the shore the departing men, their lovers, their bread-winners, with sorrowful love and prayer in their looks, their mien, their hands, and their attitudes.

Possibly this profound picture moves me so much only because it illustrates completely what I meant when I described the social mission of art in the future in these words: "In a work of art which is to attract the people, the people must find themselves again, but just as formerly the priest and king did: magnified and ennobled. The work of art must show them their own likeness, though a beautified one. It must raise the people in their own eyes, teach them to respect themselves.... Works which can show the dignity and beauty of the occupations of the multitude, which are a sanctification of labour, an apotheosis of the tragedies and idyls, of all the sweet and bitter stirrings of emotion in the common life—these works, I believe, constitute the type of the art work of the future."

Cottet's triptych is one of these works. It renders my abstract deductions concrete. He is a great painter who can extract with so sure a hand from the stone of everyday life all the gold of beauty it contains.

Cottet gets his suggestions for the most part from Brittany. Almost all his works, in any case his most famous ones, tell of Breton nature and the life of the Breton people. His "Midsummer Fire" is very affecting. The holiday fire is kindled beneath the clear sky of a midsummer night; around it assemble the Bretons, ever faithful to their traditions. The smoke ascends vertically; the flames glow on the countenances gazing on them. Old women and children they are, for the most part, who celebrate the solstice according to ancient custom; there are hardly one or two men among the devout multitude. The sterner sex, the middle-aged, laugh at the superstition; but the grandmothers foster the custom of their ancestors, and entwine it into the earliest childhood of their grandchildren as a dear remembrance that grows up with all the joys and sorrows of their infant years. Thus what is old is retained and is handed down from generation to generation. Cottet has expressively illustrated this rule of folk-lore, not because he intended it, but because he was true. Far and wide, as far as the eye can reach, other fires are burning, and mirroring themselves in the sea, and you can guess that, even around the furthest, which are hardly visible in the night, the villagers are making a circle, just as round the flame in the foreground. One single note hovers over the whole of this landscape; one single feeling dominates the soul of all this population. Each one of these old women whose glances are submerged in the holy flame feels herself at this instant a unit of the whole race inhabiting the hereditary granite soil, and part and parcel of her forefathers who have long rested beneath the sod. Thus a real work of art, without straying into literature, points far beyond its own boundaries.

The "National Fête at Camaret" is celebrated so earnestly by the Breton peasants that, in spite of the bright paper lamps on the tree, it has the effect of a church solemnity. In "The Old Breton Nag," Cottet has translated from bronze into less severe painting one of the never-to-be-forgotten coal-mine horses of Constantin Meunier. "Mourning by the Sea" is one of his masterpieces. Grandmother, mother, and daughter are sitting together on a stone bench on the shore. They are all three wearing widow's weeds. They are speechless and motionless, abandoned to their thoughts, which abide with their dead. The sea, which has swallowed their husbands, and to which they turn their backs, lurks behind them in insidious calm behind two storms that depopulate the coast, and leave behind the granite cliffs only old and young widows and children, who, in turn, also will be trained for the sea—the merciless sea, on which the poor devoted fishermen and sailors seek their living and find their death. The existence of a population, its truceless fight with hostile nature, is comprised in the black figures of these three modern Niobes. To-day, too, as in its beginnings, true art is myth-making.

To this series of pictures from Breton peasant life belongs also an "Early Mass in Winter," which at present hangs in the "Little Palace," at Paris. In the early dawn, beneath heavy clouds, a few Breton peasant women, of whom we get a back view, are proceeding across the flat, damp heath to an insignificant village church. They wear the round mantle with a hood, which is usual in that country. On first glancing at these short, broad, black figures without human form, which look like wobbling, tightly-filled coal-sacks, I could not help laughing aloud. But I observed in the mien of other observers composedness, piety, and admiration. These evidently saw in the picture only the walk to church, not the clumsy sacks, always a proof how powerfully Cottet can conjure up a mood.

Once or twice Cottet has in some measure proved faithless to his usual dark style of painting, and allowed himself to revel in colour. Thus in his portrayal of a family of Breton fisherfolk, when the corpse of a baby is laid on its bier. The dead child lies in its little open coffin, around which four tapers are burning. On both sides of the bier the seven or eight relatives stand grouped: the parents, aunts, little brothers and sisters express, each in his or her way, their grief, which, in the case of the still unconscious children only, sinks to the level of mere curiosity. From the coffin proceed two vividly red ribbons which stream across the bier down to the

ground. Flowers of a similar furious red are strewn over the bier. These shrill values do not produce exactly a fine and harmonious effect in the dark-toned general atmosphere with the opposite warm yellow spots of the taper-flames. Moreover, the composition here is also not a happy one. It is an error to make the pale little corpse of the child the centre of a large picture. Death does not attract the eyes, but repels them. It does not endure the rivalry of life unless it can compel attention perhaps by means of special melodramatic circumstances or symbolical value. The glance turns naturally to the living, feeling, acting human beings, and thus the centre of the picture, which should be the keystone of the arch that holds the composition together, seems to be a gap. Christ's dead body may be made the centre of a picture. This dead Saviour will always be, in the beholder's imagination, the most living, the only living thing in the picture. So, too, the dead Lazarus and Jairus's little daughter are suitable for the main figures in a composition, because these dead persons are virtually living, and what makes them interesting is not death, but returning life. But the innumerable "Lessons in Anatomy," which were a favourite subject with the Dutch painters (Aart Pietersen, M. van Mirevelt, Rembrandt, Adrian Backer, Van Neck, Cornelis Troost, etc.) show how unsuitable a corpse, to which no suggestions beyond its visible condition are united, is for arresting the attention. Even a master such as Rembrandt is unable, in what is, I suppose, the most famous of all "Lessons in Anatomy," to direct attention to the dead body. In spite of the large space occupied by the corpse, we do not see it, but only Dr Tulp and his audience. Cottet's picture is the most convincing proof of the impossibility, in a composition containing living persons also, of laying the chief stress on a dead one. The psychic element, _i.e._, the mourners' pain, Cottet has, however, expressed with gripping force and truth. It is his strength and glory that the inward, emotional life preponderates with him so far beyond all externals.

At the first glance his "Breton Festival" is even more repellent than the "Dead Baby." The line of hills on the horizon, the stern heath, the church, the breakfast laid on the white tablecloth in the foreground, are certainly masterly achievements; but the Breton women grouped in the open air round this still life wound us with their silk bodices of the crudest blue, green, and violet! It is said that Breton women actually dress in such shrill colours. This may be so; but that does not really justify the crude reproduction of such brutalities. It is asserted that time will subdue the overloud tones of these violent colours and effect a reconciliation of them. On this subject our children or grandchildren will have an opinion. What we see now is, anyhow, unpleasant. Has Cottet wished to show that he is able to deal with something besides asphalt and umber? If so, let him be told that his dark harmonies of brown, grey, and black are more agreeable than all these shrill penny-trumpet tones.

Cottet stands at the zenith of his life and artistic capacity. It would be rash to predict his further development. Whether he keeps to the dark style of painting, to which he owes his reputation, or lets himself be led away by the strong, bright, full colours; whether he remains faithful to Brittany, which seems with the young race of artists to take the place of the classic Italy of their predecessors, or seeks another soil and another landscape to serve as frames for his men and women of deep emotions—in any case, Cottet has already secured himself a place in the History of Art; deservedly, too, but chiefly because the change in the valuation of tones is bound up with his name. It was day; it became night. Manet and Monet had denoted dawn; Cottet introduced evening twilight.

XII

PHYSIOGNOMIES IN PAINTING

John W. Alexander, an American, possesses an enviable skill and certainty. He is master of the means of expression belonging to his art, and has a trustworthy feeling for the harmony of those light, subdued colours called in Fiance "Liberty" shades, after the name of an American tradesman in the Avenue de l'Opéra who first brought into vogue clothing, furniture, and wall stuffs in such peculiarly anæmic and almost chlorotic colours. With his dexterous draughtsmanship and charming harmony of cool, diluted blue, soft green, faint pale yellow and delicate rose, he might possibly have pleased connoisseurs, but could hardly have attained world-wide fame. He, therefore, hit upon painting women's portraits in amazing positions. He was the inventor of acrobatics in portraiture. His women lie about, in orgiastic contortions, on the ground or on sofas, with their legs up and heads hanging over the edge, or with forms twisted twice round, like a screw, or curled round like a sleeping dog, astonishing the inoffensive spectator, and suggesting to him of corrupt imagination certain lustful ideas. The means were effectual. Alexander became a first-class firm, and the _crétins_ of criticism did not fail to praise his special knowledge of, and feeling for, the "modern women of high-strung nerves and Satanic caprices." Now Alexander seems to find that he has acquired sufficient fame, and is abandoning his follies. Among his later pictures there very rarely occurs one of which the model betrays his earlier leaning to gymnastics. The ladies he now paints are quite decent in their attitudes, and only, perhaps, a serpentine movement in their long, flowing garments reminds us still of the old gutta-percha or snakelike contortions of his bodies. Alexander has slipped through the fingers of his modernistic critics. Whilst they still keep on raving about his "modern women with high-strung nerves and Satanic caprices," he is painting prosperously,

peacefully, and intelligently, and can now be recommended to the most respectable _bourgeois_ families to immortalise their matrons.

Aman-Jean is a melancholy painter, whose palette has been tuned in a minor key. He is the guitarist of the falling leaf, twilight, tapestry-hung ancestral halls, sombre Gobelins. His pictures result from the mood in which a man catches himself humming the _King of Thule_. I do not say that this tone of colour does not possess its charm. He who does not live his life like a thoughtless, devouring, and digesting animal has, I suppose, on every blessed day of his existence, an hour in which he finds his own soul in the subdued and faded palette of Aman-Jean. It is, however, morbid to see the phenomena of the universe merely as old Gobelins in the hue of twilight hours. And morbid, too, is the way in which Aman-Jean transforms his impressions of poems into a painter's view. I know, for instance, a "Beatrice" of his which affords the maximum of involuntary comicality. Before an artificial-looking orange-tree, which she overtowers in height, Dante's beloved, with the upper part of her body thrown back, and her stomach pushed forward, performs a sort of _danse du ventre_. To her girdle she has a golden laurel garland hanging, which, as a note of illumination in the dull night-hues, has an excellent effect as _valeur_ (as the French say), but as an object or requisite is very comic. Aman-Jean himself, with that misappreciation of subordination in his pictures, which is so common among artists, lays far greater value on such ridiculous whims than on his portraits. And yet it is only in these that he shows with what sureness and intensity he is able to seize and lay bare the most inaccessible and most mysteriously elusive thing that reality has to exhibit, viz., living man. His "Jules Caze" and his "Dampt the Sculptor" belong to the most delicate portrayals of men, just as his "Paul Verlaine" and "Madame Henri Martin" must also remain unforgettable by every one who has beheld them.

His portraits, to be sure, are not by any means of the same value. There is, for instance, a portrait by him of a "Cossack Colonel" that must fully mislead in regard to him. Materiality is entirely lacking in the full-length figure he has painted of the Russian officer; it is clapped flat on the canvas like a pancake. A laurel bush climbs from the bottom to the top of the picture—one cannot say in the background, as the picture has no depth, but, apparently, behind the man. The shrub seems painted on the wall to the height of the head. It suddenly grows plastic before our eyes, and shoots its leaves in front of the colonel's nose and forehead. By this symbolism which scoffs at all the laws of perspective, the painter evidently wants to suggest relations between the warrior and fame. One can only shrug one's shoulders at such puerility.

He is more and more breaking himself of the habit of regarding living models, and allows himself to be hypnotised by the Præ-Raphaelite magic lantern. We might wish for an Orpheus to take this noble artist by the hand and lead him back to the light from the shades in which he has lost himself. Perhaps the adventure would be more successful than in the case of Eurydice.

Albert Besnard.—Contemporary painting knows no more harsh contrasts than Puvis de Chavannes and Albert Besnard. The former saw nothing in the world except spectres; the latter sees only fireworks. Puvis's eyes perceived no living colour; Besnard's eye is in a state as if it had received a violent blow from a fist, in consequence of which it saw the proverbial ten thousand candles. There is nothing objectionable about his delight in colour; on the contrary, any one who is not suffering from Daltonism would be delighted to be invited to his debauch of colours. If only Besnard only satisfied his taste in a somewhat nobler way! It pleases him to introduce his dazzling rockets into women's faces, and there no man of healthy taste will care to follow him. Besnard has marvellously beautiful yellow, orange, green, blue, and red on his palette. He can attune them, too, to a beautifully sounding harmony; but why must he put yellow on the cheeks, green on the hair, and blue and orange on the shoulders in his portraits? Why must he so portray his model as if it were streaked with luminous paint or bathed in a stream of light that has flowed through a coloured glass window? His mastery of drawing and modelling certainly makes his colouring-run-mad somewhat more endurable, but it does not justify his not searching for the tumult of colour which he loves in actual life (where, after all, he might with some effort find them), but chasing them into actual life without any regard or thought.

In the _salons_ of late years, Albert Besnard pursues a curious policy. Near one or more aggressively stupid works, he exhibits a portrait or painting which is amazingly rational. In this there is method, unmistakably. It is a sort of self-defence. Besnard seems, from his canvasses, to address the visitors to the "Salon" in these words: "You see that I am in private life quite a sane individual and correct painter, who is as much the master of his art as anybody in the world. The other rubbish is for the fools of modernism. For those I am bound at times to play the Jack Pudding, but you need not, however, worry yourself about that." Once, for instance, this painted plea was the life-sized portrait of Denys Cochin, the nationalist deputy for Paris—an excellent work, laborious, powerfully drawn, and irreproachable in colour, which reminds one of Herkomer's best style. His clownery, on the other hand, was a huge picture which Besnard calls "The Isle of the Blessed." A bushy shore in the foreground, then a wide expanse of water which looks partly like sand, partly like wine-soup, and only in the remotest degree like natural water. Finally, in the background, a flat shore with the outlines of a white town that stick, as if cut out of paper, on the blue horizon. Across the level sea where it is reddest,

glides a skiff in which stands, in the attitude of the Saviour calming the tempest, an enigmatical figure in red, flowing garments, and with the countenance of an Indian chief, surrounded by a grass-green and wine-dreg-coloured woman and a monkey-like rower of sulphur-yellow hue. On the bank young maidens tarry for the new arrivals, their light raiment, blown bell-shaped by the breeze, reproducing a _motif_ of Botticelli. Between the trees groups of bright-coloured figures are camped, and on the steps of a hill sit or lounge flute-playing fauns, one of whom has the typical head of a retired French colonel. The women in the skiff are distinguished by distorted, acrobatic attitudes, which no model could sustain for ten minutes without supports and props. On principle, no two figures are placed side by side without being clad in the most opposite colours in the spectrum. This arrangement of colours suggests the thought that none of the figures must move away from the side of the others, and none could step into another group, as otherwise the harmonies intended by Besnard would be destroyed. That seems boldly and freely fanciful, but is soberly and painfully subtilised. It is a mechanical game with contrasts of colours, devoid of purpose and even of the charm of any sense of colour. Albert Besnard has, in his later days, evidently discovered Böcklin, or even has only heard him extolled and wants now to make his own Böcklin. The fauns—up to their heads—the maidens on the shore, the blue sea, the white town in the distance, are descended in the direct line from the pictures of the Bâle master. But Besnard has imitated the details as any one may copy a writing which he cannot read. “The link of the spirit is all that it lacks.”

Jean Boldini is one of the most remarkable painters of female portraits in our time. In these he makes himself most solicitous to unite together the screw lines of Alexander’s demoniacs twisting in hysterical convulsions, and Zorn’s bold, sunbeam dances. The faculty of tumult hardly any one among contemporaries possesses like this uncommonly skilful Italian. His pictures seem to fly up as from a bursting bomb. Every fibre in his women palpitates and throbs. One of his women sits half naked, just as if she had torn, in a rage, the clothes off her body, on a lion’s skin, and he has made the head and skin of this common floor-rug bristle with such an expression of cruel savageness, that you jump back in terror from the expected spring of the bloodthirsty monster. Another woman wears on her arm and shoulders a feather boa with wonderful convolutions, which seems to rustle from her in excitement like an eagle. A third lady stands in a door frame—she seems to be about to spring forward with the leap of a tiger. She wears one of those very modern, low-cut evening dresses, which are fastened over the shoulders only by a tiny chain; her bust looks as if it were laid bare because her dress was torn from her body in a brutal struggle with a satyr. There is an atmosphere about this woman of all hysterical convulsions, St Vitus’s dance, or defence with teeth and claws against lawless attempts. There is a story about sorcerers and witches who through a touch give another shape to men. This changing of skin is not practised only in fairy tales. Certain portrait painters also have it in their power. Old Cabanel transformed the rich, fat wives of wholesale merchants and owners of house property, whom he painted for 30,000 francs, into goddesses of the old Greek mythology. Boldini by a spell transforms the ladies who trust themselves to him into mænads, mad women, evil witches that ride of a night on broomsticks to their Sabbath. I do not believe that people pay him 30,000 francs for that; but if a lady even disburses a centime to be represented by Boldini as a Bacchante or a Vampire, she must be as much a victim to neurosity as Boldini makes her out to be.

William Bouguereau.—The contempt of Bouguereau is the beginning of wisdom in art. That everybody knows who has occupied himself with contemporary painting otherwise than as a picture-dealer. Among the long-haired ones who dwell on the mountain land of Montmartre, no name conveys a worse insult. He who wants to make an impression on the Botticelli ladies when visiting the “Salon,” must make a grimace of sudden, severe nausea when he comes across a painting by this “manufacturer of perfumery labels.” On the other hand, Bouguereau has managed to collect in his head in a coronet of all sorts all the honours that blossom for an artist in France. He is Commander of the Legion of Honour and Member of the Institute; he gained the _Prix de Rome_, and has pocketed all the medals that the Salons and Universal Exhibitions had to bestow. His works fetch the highest prices in the market, and if no Parisian artist finds purchasers, the big pork butcher of Chicago, that painters’ Providence, to whom in their prayers they turn their countenances, always has gold for Bouguereau. The deplorable Philistine, who would also very much like to have a little share in the æsthetic enjoyments of this world, tears his hair and groans: “Where is truth?” The _Chat Noir_ treats Bouguereau as a buffoon, but the Academy erects altars to him. Criticism scoffs, but America pays. And, however readily the Philistine yields to the appearance of daring modernity, if he listens to the voice of his own heart, he notices to his embarrassment that Bouguereau, as a matter of fact, pleases him. He gazes with secret delight at his “Cupid and Psyche,” his “Pearl,” and “Innocence,” his “Oblation to Cupid,” his “Wasps’ Nest,” his “Cupid _mouillé_,” his “Holy Women at the Tomb.” It is always the same: a sweet maiden, or even several, a well-built youth of rosy body and slender limbs, laughing little mouths with pearly teeth, blooming cheeks, snowy bosoms and rosy fingers—all lovely, all a delight to the eye. The Philistine wriggles under the decree of fashion, which forces him to find these charming things horrible, and his troubled look frames the question that his mouth dares not utter: “Why? Why?”

I think we are doing a good work when we answer him calmly and in a friendly manner, without exaggeration or cheap witticisms which neither explain nor prove anything, not even necessarily the sincerity of the witling. Bouguereau pleases the insufficiently

trained eye, because he paints prettily; but in art prettiness is the direct opposite of the beautiful, for it is untruth, since a conscience originally delicate or happily trained only feels truth to be beautiful.

Prettiness is necessarily untruth, for it is that which is conceived without trouble, which excites no opposition, which compels no strain on the attention and no adaptation on the part of the spectator to the peculiarity of the artist. Its effect is merely the effect of what meets the spectator's pre-existent thoughts or feelings completely. This pre-existing element is not, however, the result of collective observation and strong feeling, but the dissipated precipitate of the most fugitive, indifferent perception, which is totally unfitted to obtrude into the world of phenomena.

The artist whose goal is prettiness, does not glance at reality, but at the soul of the crowd which he wishes to please. He does not portray what he sees, and what makes an impression on him, but what suits the feeble, inexact concepts which the average man forms of things. He is a courtier of the crowd; he flatters their shallowness and incapacity. He wants them to say, with a self-satisfied smile: "This man is a great artist, for he has the same way of looking at things as ourselves." Prettiness is, in lyric poetry, rhyming "love" with "dove," "heart" and "part"; in drama, it is rewarding the good characters with advantageous marriages and lucrative posts, and making the wicked fall into the pit they have dug for others. For this is just what the public expects; such is the world-picture which the world has arranged for itself, and it is grateful to the poet that he does not force it to rectify its comfortable way of thinking.

In the plastic arts prettiness is the average or typical. Bouguereau paints a pattern, not a person. He has a canon to which he holds; and if he would only go so far as to look at real human beings, and had to admit that nature does not act according to his canon, he would certainly say: "So much the worse for nature."

Superficiality always confuses prettiness with the ideal. One cannot fail to see that prettiness lacks exactness. This inexactness is, however, praised as an improvement on reality: the master of prettiness understands nature better than she understands herself. He guesses what she would, but cannot always, do, and comes with his superior creative power to help the poor incapable. The truth is that prettiness is the exact reverse of the ideal; for the ideal is the presentiment of future developments: prettiness the pompous repetition of what is commonplace. The idealist is impelled by a restless longing after novelty to represent; he seeks in invisible germs which the average soul does not perceive to detect the later glory of blossom. The painter of prettiness shows scant satisfaction in attainment, and his creation is nothing but a sleepy reminiscence of impressions he is accustomed to.

The chief harm done by prettiness in art is that it confirms the multitude in their dulness instead of arousing them from it. What the "man in the street" feels in presence of a work of Bouguereau's is self-complacent pleasure at the artist agreeing with him. He will expect the same feeling also from real works of art, and be disappointed if he fails to find it. Pretty paintings deaden the mind of the average man for powerful works, which teach men to see, educate eyes, operate for cataract, and heal colour-blindness, are keys to the hidden sense of lines of movement, interpret the symbolism of form, and point the way to unknown beauty. The bloodthirsty backwoodsman of Montmartre is, therefore, right to think little or nothing of Bouguereau, and to scalp him; and the Philistine who expects to elevate and enrich his mind by art must make the sacrifice of renouncing the cheap pleasure which the engaging banality of prettiness procures him.

If Bouguereau has anything personal to say, he can say it no worse than many another. His "Portrait of Himself" in the velvet painting-jacket is sincere, and at any rate strives to be honest. It is true that here, too, he has not been quite able to overcome his habit of embellishing, and his cheeks are distressingly rosy. One could not expect from him the almost terrifying inexorableness with which a David has confessed the dreadful grimace of his face paralysed on one side, and a Rembrandt, in his old age, the puffiness of his features and the wateriness of his eyes. These men had such a pride in truthfulness that, in their anxiety not to be partial, they felt almost hostile to themselves, and tried, and judged themselves accordingly. Bouguereau does not understand why he should treat himself more ill-temperedly than his Cupids and nymphs, and smiles good-humouredly at himself.

Frank Brangwyn.—This young Englishman, born in Belgium, is a painter of the great class from which the kings of art spring. In his delight in colour, he reminds us of Delacroix in his _Sturm und Drang_ period; in the dauntlessness with which he wields the brush, of Franz Hals himself, the boldest fighter with this weapon that ever lived up to now. His two first works exhibited in the Paris Salon, "A Sailor's Funeral" and "All Hands Aloft," instantly called attention to him. His "Buccaneers" was a veritable revelation. In a boat, floating on the blue-black tide of the Carribean Sea, row some life-sized fellows clad in variegated material, their heads bound with bright red cloths. In the glowing, tropical sun that swelters down on them, everything is a blinding, bright flame: the foam, wet oars, the ship's planks, the clothing and headgear of the people. The brown cut-throats get in this noonday glory an almost superhuman

relief, and in their savage countenances a calm consciousness of their formidableness is revealed, which even in the picture has the effect of a challenge to mortal combat. A year later he exhibited “Goatherds,” likewise life-sized, and likewise plunged in the noonday glow of a southern sky, and, in addition, a reposefully coloured and marvellously deep night-piece, “The Three Holy Kings offering the Infant Jesus Gold, Incense, and Myrrh.” His ability was further enhanced by a “Market on the Shore” and a “Miraculous Draught of Fishes.”

The “Market on the Shore” is held in a Barbary harbour. Little bright-coloured carpets are spread on the yellow loamy sand, where negroes in brown and green-lined _haiks_ and _burnooses_ lie squatting. They are surrounded by poorer people in fantastic rags, with red _tarboosh_ on long, clean-shaven Hamitic skulls. Beyond, three ships extend their prows over the flat beach, and in the background, on the further side of a strip of water, we get a glance, through a gateway with three pointed arches, at the dim throng of a mysterious Mohammedan town.

The “Miraculous Draught of Fishes” takes place in the evening. The fishing-boat rocks softly on the almost oil-smooth, dark blue mirror of the Lake of Genesareth, on the shallow valleys and crests of whose waves the setting sun’s nearly horizontal beams strew leaves and strips of thin gold. Four fishermen are busy hauling in with powerful movements the net heavy with their catch. Behind their vessel, a green, flat-bottomed boat with sails, steered by a disciple, carries the Saviour, veiled in the gloaming, across the water.

Religious subjects have an especial attraction for Brangwyn. In his great picture, “The Scoffers,” he shows a man with the bearded curly head of an enthusiast, fastened to a pillory. The scene, as is usual with Brangwyn, is an Eastern town. A crowd, which is amusing by its negro and Moorish types and their charming garments and rags, presses on the prisoner, who is wearing the strange garb of a Western artisan, and reviles him with the words from their mouths opened in sneering laughter; with the glances of their stupid, malicious eyes; with the gesture of their forked and pointed fingers. Pity is mingled with curiosity only in the case of a handsome, brown, young maiden in the foreground, who, with a noble water-pot on her head, evidently returning home from the spring, remains standing in order to gaze at the scene. You may understand the story as you please. Perhaps it is a foreign socialist or anarchist, who tried to preach his doctrines there, and to whom the authorities are giving short shrift, and whose only reward now is the mockery of the stupid crowd to whom he intended to bring a message of salvation. Perhaps the incident has a deeper and more solemn sense, and is the subjective, half-touched-up, half-modernised representation of the mocking of Christ when He was bound to the pillar in order to undergo flagellation. Whether the drama is conceived from a sociological or theological standpoint, it is of supreme power. The great pain of the altruist who sacrifices himself for mankind, and sees his sacrifice despised; the great sin of the populace that is thoughtlessly guilty of the most horrible ingratitude, are strikingly expressed. And in what form is this rich spiritual and moral purport clothed? Such repose and nobility in varied colour; such witchery in the flat triad of dark yellow, reddish purple, and deep blue; such amazing sureness in modelling by means of mere patches of colour without outlines, it has not been my lot to meet with twice in contemporary painting.

Neither must I leave his “St Simon Stylites” unnoticed. The saint is sitting, with his back resting against a pole, on the platform of his lofty pillar. On the other edge of the platform, ascending by a ladder, appears a priest in mass vestments, accompanied by a deacon, in order to administer Holy Communion to the Stylite, who is apparently dying. The story, however, is a matter of indifference. It is the wonderful harmony of colours that makes this picture so expressive. It is late in the day; twilight is approaching; the last ray of sunlight is finely sprinkled through the air around the figures above the roofs of the Syrian town, from which arises a transparent cloud, so thin that it is rather a breath, an exhalation, than a vapour, and is more surmised than seen. A flight of swallows glides past the saint, and the birds, with their arrow-swift and pleasing motions, observed in the precise Japanese way, greatly help to produce an impression of height and airiness, which Brangwyn attains chiefly by his art of distributing light, and his eerie perspective.

Brangwyn fixes in his pictures all the magic of noon and midnight. He shows his figures either flushed by the quivering heat of the full burning sun, or covered with a veil of half-transparent darkness. Both illuminations have the peculiarity of suppressing all subsidiary work and letting only what is essential remain. The face or body of a man steeped in sun rays becomes almost transparent. Behind the skin and the connecting tissues which we perceive only as a covering, the muscles and bones come forth. The intense brightness prepares a body almost as the dissecting knife of anatomy. Darkness has a similar effect; it blots out the connections and transitions, and only accentuates the strong lines of construction. Only diffused light gives an equal value to all the parts of a surface; it shows all and explains nothing. Direct light, on the other hand, just like darkness, graduates phenomena, makes us recognise at the first glance what is external ornamentation and what are the supports and timber.

Brangwyn is an impressionist in the best sense of the word, a perfect representative of what Impressionism contains that is justifiable. He does not stop over trivialities and accessories. He sees only the essential in phenomena, but this he sees with infallible certainty and intensity. A feature which marks exhaustively the direction, purpose, and force of a movement; a spot of colour that challenges and fixes the eye, as a sudden stroke of a bell does the ear—these are the optical elements which he grasps, and with delightful simplicity, weight, and carelessness, and, as it were, in student fashion, throws on the canvas “straight from the wrist.” The spectator finds once more in the picture exactly the component parts of the phenomenon which in the actual thing would alone excite and fix his attention, and, corresponding to his psychological habit, he supplements the indications of the painting by pictures from his own memory, till it becomes a perfect copy of the real thing, which then includes also all the subsidiary matters either merely hinted at, or quite passed over by the painter.

Brangwyn is one of those rare gifted _virtuosi_ who does not need to draw. The line does not subsist for him, just as it does not subsist in nature. He models with light and colour. He puts spots irregularly near one another, little and big, long and short, angular and round, bright and dark, white and coloured; and from these spots, from this mosaic of correctly-felt effects of light, he builds up the phenomenon in space with incomparably genuine and intense corporeality. Our judgment adds the lines which the painter has never drawn, as it does when looking at the actual thing. We have here the optical elements themselves, which are perceived by the retina of the eye as mere gradations of light, but are apprehended and interpreted by the higher centres as coloured and plastic phenomena. Such a way of painting demands infallible certainty of sight and trustworthy obedience of the hand, else it leads to bankruptcy in art.

Paul Cézanne.—He was one of the protagonists and pioneers of Naturalism. He was with Claude Monet, Caillebotte, and the other Impressionists an interesting subverter; with Zola he was for a moment a victor, and is now vanquished, although, probably, he will not admit it. A barefooted Masaniello, whom a successful revolution of the rabble carries to the top and lodges in the king’s palace, but who has very soon to exchange his purple mantle for his hereditary rags. Fortunately, the lot of overthrown art-revolutionaries is not so horrible as Masaniello’s; they do not end under the executioner’s hand.

Cézanne has one thing in his favour which prepossesses us for him, _i.e._, his uprightness. It is his nature that ugliness has for him an attraction. He sees only what is abnormal, unpleasant, and repulsive in actual life. If he paints a house, it must be warped, and threaten to tumble down soon. If he portrays a human being, the latter has a distorted face, apparently paralysed on one side, and a deeply depressed or stupid expression. Every model that submits himself to him is put in some sort of convict’s dress. Here is a female portrait. A withered, dried-up face, mud-bedaubed clothes that look as if they had been trailed through the gutter. Doubtless a “professional” who at a raid was accommodated in “Black Maria,” and, after a night in the cells of the police station, discharged? Nothing of the sort. She is a respectable lady of the upper middle-class. This man with the trouble-distorted countenance and the greasy felt hat and overcoat is perhaps a starveling from Bohemia, a broken-down creature, ruined artist or writer? Most certainly not. He is a well-to-do person of independent means. It is curious to me how any one can allow himself of his own accord to be painted by Cézanne, unless it were done in a contrite, penitential mood as a penance. To be sure, one cannot be angry with him, for he does not treat himself any better than his other victims. He has painted portraits of himself which would be grossly libellous if another had painted them. In truth he is not vain, for he sees himself as he represents himself in these pictures. And his morose eye disfigures not only faces, heads, and raiment, but also the rest. Heine assures us that “A woman’s body is a poem.” He would not dare to sustain this statement if he were to see Cézanne’s “Three Naked Women before the Bath.” Such nudities are really immoral, and shriek, not for a discreet fig-leaf, but for a nine-fold covering of cloth and fur.

Blaise Desgoffes.—This painter, who died in 1902, was an incomparable copier of still life; for indeed there exists a still and secret life in the productions of the artist’s hand, as an eye lovingly steeped in form and beauty of colour sees them. Desgoffes was great in little pictures, which rendered splendid things of gold and enamel, of rock crystal, jasper and chalcedony, trinkets and precious stones, lace and embroidery on velvet and silk, carved and polished ebony in insurpassable perfection. There is a school which very contemptuously calls these pictures _bodegones_. That is the disdainful Spanish expression both for a cookshop and for daubed representations of vulgar eatables such as sausages, smoked herrings, and cheese made from whey. Copying the productions of human hands should be unworthy of an artist. Only what is living, nay, only human life, should be justifiable. But that is too narrow a conception. Certainly the highest mission of all human art is the portrayal of men and women; and what is not itself human becomes artistic in proportion as it gains relation to humanity by means of secret anthropomorphic animation and spiritualisation. But he who demands harshly and dogmatically that the human figure should be treated to the exclusion of everything else, relegates a Hondekoeter, a Landseer, a Rosa Bonheur to the second class, and denies a Desgoffes the title of artist, which is sheer nonsense. I do not know if there is a precedence in art, or any other precedence than that of the ability to

express and transmit the life of emotion. Anyhow, a man stands very high who understood how to translate into painting the optical peculiarities of choice woods, metals, stones, and textures better than any painter before him.

Léon Frédéric amazes like an anachronism; in him lives the soul of a primitive. Thus the Van Eycks, Roger van der Weydens, and Hans Memlings regarded the world and man. That is, however, not a sort of affected, antique skill, as in the English Præ-Raphaelites, and their Continental imitators, but genuine, unconscious atavism, the purity of which is evident from the fact that Frédéric paints no masquerades, but only nude, human limbs, or contemporary types of the people in the miserable working garb of our days. If they appear like figures out of mediæval ballads or folk-stories, it is because Frédéric feels them so. He is an out and out Fleming: mystical like his countrymen Ruysbroek, Suyskens, etc.; and, besides, delighting in form, like the builders of the Belgian cathedrals and guildhalls; in love with life, like the feasters and dancers of the Flemish kermesses; honest and conscientious in his work, like an old guild-master of the time of the Spanish Netherlands; brooding and earnest, like a Beguine or a Lollard.

Frédéric does not actually copy, but he is curiously vivid in his recollection of what he has seen. The old Low-German and Flemish masters, whose outlook on the world he shares, hover before him. From the Low-German artists he has his _naïve_, brick-red flesh tone and the painfully conscientious kind of workmanship, which neglects no wrinkle in the skin or curl in the hair; from Memling, his loving accuracy in treating all accessory work—flowers, ground, clothes, and utensils. Sprinkling the whole canvas with equally finished details, chiefly luxuriant plants, is common to Frédéric and all the Præ-Raphaelites. The pictures of this school, even if they take their subjects chiefly from the fourth dimension, are optically of two dimensions. They are only surfaces. They do not understand perspective, and, therefore, cannot shade off a middle distance or background. Everything lies in one and the same plane and is treated with the same clearness and precision. In the accuracy with which they render every little stone, every texture, and plant, the Præ-Raphaelites have no equals. If, in addition to this, they could paint human beings also, they would deserve unstinted praise, at any rate, as draughtsmen, if not as colourists.

Frédéric feels the sacredness of his art profoundly, as do few other painters of the present day. He seems to himself a priest. It is an external, but a characteristic one: he paints hardly anything but triptychs, which he regards, to a certain extent, as altar-pieces of a philosophical religion; and what he portrays is always a sort of pathetic symbol, from which there comes a sound like verses from the Bible or Vedic hymns. His symbols are not always clear, but it is not his fault that painting is not a fit expression of brief syntheses of long trains of thought, or ethical and philosophical abstractions. At most it is his fault that he does not feel this. His triptych, the “Golden Age,” is, for instance, a view such as Ovid might have described if he had lived in a Belgian district among Flemish people. Frédéric relates the history of one day of his happy race: how human creatures of all gradations of age sleep peacefully in the gleaming night, clinging to one another; how they are awakened by rosy dawn and refresh themselves in a crystal brook; how, beneath a noonday sun, they play and dance and shout for joy, pluck blossoms and fruits, and sit before dainty dishes. It is a profusion of magnificently modelled nude women who are all very red of skin; a laughing exuberance of life such as an old-time worshipper of the obscene god of fruitfulness might have dreamt of amidst the reek of sacrifice. It is also a funnily cannibalistic debauch of delicious children’s flesh and blooming, well-nourished bodies. In other pictures Frédéric has occasionally tortured us by quite as perfectly painted, but, on account of their inexorable truth, fearfully painful representations of radiant nudities torn by thorns, and whole heaps of children’s corpses. Here, however, he is all joy and peace, and his picture is a delight to the eye.

In another of Frédéric’s triptychs, “The Ages of the Workman,” we can measure the whole emptiness of such concepts as “Realism” and “Idealism.” Compare Frédéric with the Bastien Lepage of the Luxembourg. Bastien Lepage passes for the most perfect didactic type of realistic painting. His brutalised, ape-like, feeble-minded, staring Reaper is supposed to be genuine, unrouged nature. Possibly the painter has, on some occasion, seen a disgusting idiot of this sort. I do not know, but I will believe it, for I should like to assume that he had not discovered in his own imagination so perversely distorted an image of the human form. But as such repulsively bestial young women are, in any case, rare exceptions among the white races, Bastien Lepage has unmistakably taken the trouble to choose out of thousands the most hideous model he could hunt up, out of a base, corrupt delight in ugliness, with the malicious intention of defaming nature. Frédéric tells a story in his triptych, “The Ages of the Workman.” Who can deny that he, too, has held with absolute accuracy to reality? On the right, early childhood: workmen’s wives, young and fair mothers are suckling their babies, sweet, fat little creatures with firm little limbs and skins like rose leaves; little maidens, who can hardly stand on their feet, take in tow and act the mother to still smaller brothers and sisters; old grandmothers, who can no longer take part in the labours of the household, keep an eye on the children crawling and swarming about. In the middle, youth: neglected yet happy scapegraces are playing cards in the street, sitting or squatting on the curb-stone; undisciplined lads are venturing the experiment of their first cigarette; grown-up youths go out with young girls of their class on their arm; what they whisper in the ears of their

blushing sweethearts would scarcely delight severe guardians of morals; but, at that period of life, in that human environment, their feelings are so natural and healthy that, in spite of all crabbed affectation, they are felt to be pleasant and touching. Finally, on the left, men in their prime are at work: they are erecting toilsomely, with heavy pieces, a scaffold, and a little youngster looks at them; what he has before his eyes is his own future lot, but in his careless, boyish curiosity he notices only the amusing side of the growth of a skilful and intricate work of man, not the hard seriousness of the ill-paid, dangerous, and severe exertion. Thus the life of the poor artisan lies exposed to our gaze. Frédéric does not conceal from us either its hardships or the scantiness of its material condition. He shows us how poorly the people are clad, how ugly their streets and houses are, how narrow is the circle that includes their petty joys and sorrows, and how serious, now and then, is their pastime. But he makes us see also the sunshine resting golden over their years of childhood and youth, and feel the satisfactions with which their families also animate and delight their monotonous existence. He brings these poor, humble people humanly near us, and gives us a great lesson in brotherhood. Every feature in his picture is true; but from this truth a noble and consoling thought proceeds, revealing to us its full extent of beauty and moral motives. Frédéric is a Realist quite as much as Bastien Lepage, so far as he deals with the painfully exact reproduction of sights he has actually observed. But in Frédéric's presentment the commonplace appears ennobled, and that a superficial æstheticism dubs Idealism. The fact of the matter is that the words Realism and Idealism mean simply nothing. There is no art, there is no artistic tendency, which could be so designated. There are only artists' temperaments, which are themselves bilious, and, for that reason, dwell with malicious joy on the unpleasant sides of reality, and others which delight in all that is bright, and have a presentiment of a deeper redeeming meaning even behind the unpleasing external. The Realism of a Bastien Lepage is calumny; that of a Frédéric, a speech for the defence.

Jean Paul Laurens has reached all the heights of artistic success. He is a professor, an Academician, and he receives the most honourable commissions from the State and great cities. He has been graciously permitted to satisfy his ambition as a monumental painter with enormous wall- and ceiling-paintings, like those of the Capitol of Toulouse. He was often more happy, often less happy, always powerful, always pathetic, now and then, I will admit, declamatory. But he has also once forsaken his visions of history and turned a glance at the present; and what he saw there, he fixed in a great painting which he calls "Mining Folk," which stands above all his far-famed frescoes.

It is evening. Between a high, steep-sloping heap of coal and slack and a low line of distant hills closing the horizon, a big town is painted in a wide trough of country. Over the crowded roofs of this town numerous chimneys rise up. No church towers or palace gables, only chimneys which belch aggressively, one might say, white vapour or dense black smoke in the face of the twilight sky. From the middle distance a procession of weary, toil-worn men, whose legs drag and heads hang down, is moving forward along a causeway. From the depths on both sides of the causeway ascend clouds of sulphurous yellow and blue smoke.

Any one engrossed in the details may see how the workmen wandering homewards are clad in the garb of the modern proletariat, and how a manufacturing town of the present day with typical factory buildings lies stretched before us. But the first rapid, comprehensive glance conveys quite a different impression. The town looks like a Sodom and Gomorrha in rebellion against God, and is on the point of being chastised by fire from heaven. The procession of men appears to be a band of the damned which a hidden, mysterious abyss of hell, behind the bend in the road, has vomited. Near the causeway, uncanny depths seem to yawn, from which tongues of hell-flames leap up. It is a prophet's vision, and the atmosphere of a saga. You fancy you have an illustration of the Inferno before you, but also a note from the formula according to which the painters and sculptors of the Middle Ages were wont to depict the Last Judgment.

And the most remarkable thing is that this epic extension and enhancement of so banal an incident as the exodus of a shift of pitmen knocking off their work is by no means intended. The painter nowhere consciously works with a view to melodrama. He keeps, in all details, strictly to facts. It is only his perception that has made a canto of Dante out of a true copy of an everyday incident. At the sight of the flaming forges, smoking chimneys, and exhausted slaves working for hire, there came to him an inkling of the mighty forces of nature and society which are at work in the man- and horse-powers of a modern wholesale business, which fixed the choice and arrangement of elements in his picture, imprinted on it the demoniac feature, and rendered it a profound symbol of the history of a part of humanity.

Jef Leempoels is one of the most interesting of contemporary Flemings in whom the exquisite artistic qualities of their mediæval forefathers and masters live again. Leempoels has the sturdy, homely truthfulness of these ancestors, their profound feeling, and speculative mind, which easily goes astray into the fantastic. He has their masterly draughtsmanship, and he only lacks their delight in colour and their gift of free, clear composition to rise entirely to their greatness.

He does not rely on his capability or right to distinguish between the essential and the non-essential. He does not dominate his subject with sovereignly subjective perception, but makes himself the humble slave of the phenomena and all their most capricious and lowest details. He does not span the world with the eye of a creative artist, but glances at it as though he were a photographic apparatus for taking authentic negatives. To this intellectual dependence is joined an insufficient development of the sense of what is picturesque. Leempoels is dry in his accuracy and sober in his colouring. He does not seem to think it is his vocation to harmonise tones and to please the eye by a well-arranged palette. And in spite of all this I can never forget his chief pictures. He revealed his nature in _naïve_ little features. For instance, on the wall of the room where the father and mother, old and worn out by life, are sitting together, hang faded photographs representing them, as a young married couple, in a strikingly comic dress according to the latest fashion of five-and-twenty years ago, yet young and full of joyous hope. This discreet contrast, which must be sought for to be noticed, contains the whole melancholy poetry of their life from blooming youth to withered age. And the pictures of his sisters. The good girls are not particularly favoured by nature; they are true daughters of the homely Flemish race, in whom beauty is rare. When Leempoels painted them, there was a struggle in him between the conscientiousness of a sworn witness to reality and brotherly love; but the former gained the victory, and the latter was allowed to reveal itself only in the delicate, almost caressing, perfection of their hands, necks, hair, and clothes.

His picture “Friendship”—an old and somewhat younger man are sitting boldly before us, hand in hand, with their honest, ugly faces turned full towards us. They are figures from the people, the one wearing a green, the other a dark red knitted waistcoat. They are evidently neither rich nor educated, and no particularly developed intellectual life speaks from their clear, reposeful eyes, or their heavy, vulgar features. And yet they are noble creatures. It is their feeling which ennobles them. Only lofty souls are capable of such loyalty and attachment as these two workmen, who so affectionately clasp each other’s hands and lean shoulder to shoulder—let come what come may!—and he who comprehends character without declamation says to himself involuntarily before this picture: “It is well for him who in his path through life meets with such friendship.” Here Leempoels has performed the highest mission of the artist—he has recognised and indicated convincingly what is grand and beautiful in the insignificant and commonplace. That is healthy idealism, for which it is my pride to fight—a consoling and uplifting moral purport in an exact and true form.

I am less agreed in respect of another picture. Leempoels calls it “Fate and Humanity,” and in this he has gone beyond his natural vocal register. From the lower rim of the picture there grows a marvellous flora of hands stretched forth on high, either folded in supplication or clenched in threatening fists, embracing many symbols of faith of various kinds, such as crosses, communion chalices, fetishes and offerings; over them appears, in violet light and filling two-thirds of the picture, a huge, bearded face that, indifferent and unmoved, gazes forward without noticing the hands of supplication and blasphemy raised towards it. It is plain enough what Leempoels wants to express; but it is not apparent what the effect will be of this violet face as inexorable destiny. Its feeble, vacant gaze and stiff nimbus infuse no particular horror, and nothing else which might be imposing is discernible in it. On the other hand, Leempoels imparts to the hands the full measure of his amazing capacity. These hundreds of hands, which are painted with a patience that is almost painful, have all their individual physiognomy. They are all individual hands of men and women, young and old, industrious and idle, Caucasian, Nubian, and Indian. The hands of all races, callings, ages and temperaments are so perfect in their characterisation that error is impossible. If among the hands were to be found those of a friend, I should certainly recognise them at the first glance. As a study of human hands, the piece is a museum-picture which has not its peer in all the collections with which I am acquainted. As a work of art it saddens through want of taste. Leempoels would sin against himself if he strayed into unlimited symbolism. His talent points him in the direction of the clearly circumscribed. He need not trouble himself about being implicated with Philistinism through his devotion to actuality. His sincerity of feeling, too, in the treatment of Philistine subjects, will always raise him above Philistinism.

Henri Martin has always aimed at lofty ends, but the paths he has followed to gain them were crooked and wrong. He was, when he began, and still is, in moments of relapse, a dabbing stumper, _i.e._, he laid on a thick dab of colour the size of a hazel-nut and extended it somewhat. With this method, his famous “Vibrations” was, indeed, successful, especially at a certain distance; but he broke up all form, and this allowed him to draw quite superficially. If any one reproached him with not rendering a single outline with exactness and certainty, he could use the excuse: “One cannot at the same time flood a picture with flickering light and model precisely.” Stumping was with Martin as with his imitators the cloak to cover up artistically dishonest forms. His idealism—the main feature in his physiognomy as an artist—was revealed, in his first period chiefly, by his feeble figures being dressed in the garb peculiar to no time or country, the garb in which the Primitives were wont to make their angels appear, and by their moving in an artificial stage, which one can call neither earth, nor air, nor heaven; for, as a rule, it was painted a single iridescent, mixed colour, mostly a sort of pale lilac, into which some darker, smooth tree trunks, placed regularly like a lattice, were introduced.

Typical of his first period are his symbolical pictures “Towards the Abyss,” and “Every One has his own Chimæra.” We are almost ashamed to linger over describing this confused rubbish.

“Towards the Abyss.”—A hussy unclad after the fashion in vogue at a Paris artists’ pot-house—her cunning nudity is emphasised by ball-shoes, long black gloves, and by a black veil, thrown back at the right place, but transparent throughout—is hurrying down the gentle slope of a hill. Bats’ wings wide outspread sprout from her shoulders. A crowd of people, in which men and women of all ages and ranks are mixed up, rush after her with the attitudes and gestures of epidemic madness. Some run, others drag themselves along on their knees, others, again, on all fours, after her, and scuffle for flowers which she strews in her wake. Every meaning can be imported into this picture, but nothing can be gleaned from it, or, at most, that the frenzied attitudes of the slaves and victims of this creature, wallowing in the dust, kissing and licking the hussy’s footsteps, betray an unconscious masochistic trait in Henri Martin’s soul.

“Every One has his own Chimæra” is even more futile than this perverse illustration of the pious admonition: “Keep from sin, for the lust of the flesh leads to destruction.” A number of daubed, shadowy figures crawl painfully along in a clay-coloured mass; each is bent under a burden which represents in bodily form his ruling passion. Thus the sensualist carries a naked strumpet; the miser a sack full of gold; the ambitious man laurels and the spoils of war, etc.—a lamentable attempt to represent a literary commonplace in an artist’s vision, in a living and concrete form.

Luckily, Henri Martin showed development. After his first period of crudely affected stippling and streaking, of bold neglect of drawing, amidst the shapeless daubing of coloured _confetti_, serpentines, and pomposities, with a would-be profound yet absolutely vacant symbolism, he returned to nature and life, treated warmly human subjects from an ideal standpoint, and toned down the crudeness of his execution without, I admit, giving it up altogether.

Commissioned by a rich banker, he painted for the Marseilles Savings Bank a monumental triptych which he called “Labour.” He assigns views of Marseilles—certainly treated with great freedom—to the three backgrounds. The manifest meaning of the three panels is morning, noon, and evening. In the first panel, the children are on their way to school, reading their books; the women are going to market, the labourers to their place of work. In the second, dockers, under the glowing sun of Provence, are unloading a ship’s cargo, which consists of baskets full of golden oranges. In the third, the waterside is almost deserted; an old couple, with a child carrying a doll in its arm walking in front of them, stroll in the cool of the day; some artisan families are also enjoying some fresh air after leaving off work, and

Jam majores cadunt altis a montibus umbrae.

But the times of day are, as I have said, only the plain meaning of the picture. Beside or behind it, it has also a deeper, veiled meaning. It would illustrate also an actual state of things in the future. Valiantly take full advantage of school in the morning of life, learn and prepare yourself by that means for working and daring later on. Labour in your prime until your ribs crack: you can do so, and it is lucrative. In return, in the evening of life you will be at ease, and, as a comfortable man of means, enjoy refreshing leisure.

We must be allowed to laugh at this optimistic aspect of industrial life. If Henri Martin has known a docker—of Marseilles or any other place—who was able to end his life as a man of independent means, I should like to ask him for that man’s photograph. Nevertheless, a painter need not be a political economist, and the picture is, you know, intended for a Savings Bank, and the people who will see it there may actually find themselves on the way to the independency that makes blessed, though hardly after noonday unloading of orange boats. We might be able to pass lightly over the poverty of thought in the work, if its artistic qualities were satisfactory. But there’s the rub. It was indeed a questionable thought to put in juxtaposition three pictures separated only by slender pillars, which had to exhibit three absolutely different lights; for either the lights of morning, noon, and evening were properly kept apart, and we had a discord in three notes, or the tones were pitched in one key in order not to shriek at each other, in which case they were untrue. Such is indeed the case. There is a somewhat more silvery breath about “Morning,” a somewhat redder one about “Noon,” a paler violet about “Evening”; but the lights and shadows are about equally powerful, whatever be the position of the sun. The forest of masts in the middle panel is of such exaggerated density that the eye is confused in the maze of shrouds and yards. And the entire picture is executed in the crudest stippling, with dabs of colour thickly plastered on, so that it looks almost scaly. If Henri Martin could give up his vagaries and lack of good taste, he would be a monumental artist of lofty vocation; for, though the fairies have refused him sundry things, they have given him one precious gift when he was in his cradle, viz., that of light. There is sun in his pictures, and they brighten up the space they occupy.

His best work up to now is a huge wall-painting for the Capitol of Toulouse.

A landscape of big, restful lines with a background of dark-shadowed mountain forests, against which all I have to object is that they wall in the whole horizon. From this range of darkening blue heights the country sinks in undulating tiers of hills to the plain of the foreground. Here the idyll of the seasons and men's lives is developed in three pictures. First, amidst the laughing spring, a strapping maiden, intoxicated with love, on the breast of the young lad who is embracing her. Next, a number of stalwart country folk in the summer work of haymaking, on whom, beyond the cut grass, their wives and children at play are gazing. Lastly, under melancholy autumn trees, a lonely old woman preoccupied with recollections. The people are homely, of course, without crude realism, poetic without the shepherd-insipidity of Gessner. The parallelism between the aging of the men and women and the progress of the year is unforced; the symbolism clear and free from morbid, perverse mysticism. Turf, trees, and bushes are decorative in form, delicate, and at the same time sufficient in colour, and the whole is flooded by a wonderfully joyous sunshine, which is more reminiscent of the glories of May in Provence than even Montenard's symphonies of light. Henri Martin has, I admit, here, too, indulged in stippling, but he has given his people and trees strong, free outlines, and scarred only the outer skin very lightly with pock-marks. He has not abandoned that ill habit, but he seems to practise it with remorse. Perhaps he thinks gradual transition is due to his conversion to better insight. In any case, this picture was conceived and executed in a happy moment.

Henri Martin's career teaches a moral. Let him who would honour an artist continually bear in mind an appropriately modified reading of Solon's warning to Crœsus: "Do not pronounce on any artist before his death."

Jean Raffaelli.—Like Henri Martin, Sisley, and the other stipplers who painted with little dots, Jean François Raffaelli at first painted with thin, slightly serpentine strokes. And we have had to get accustomed to this manner. Raffaelli has been able to succeed, because he long favoured subjects for which his ripple lines were the suitable style. He painted poor people in poor landscapes, emaciated bodies in slatternly clothes under trees as dry as brooms. Like a raindrop on a window-pane, and like a tear on a furrowed cheek, the slender traces of colour flowed down these pitiable figures, arousing twilight imaginations of weeping, plaintive trickling, and dissolving. Later on he caught cheerful, coloured views of Paris streets—The Invalides, Notre Dame, and the Place St Michel. In these his streaky way of painting was somewhat inadequate; but his amazing feeling for a crowd in the hurried, nervous movement which is peculiar to the Parisian lower orders, saved him. I know no painter who feels as Raffaelli the bustle of the world's metropolis. I think that any one who suffers from dread of the market-place, must get a feeling of fear at seeing his pictures.

In a third period of his production, Raffaelli gave a rare example of complete change in his maturity. He who had grown famous as a painter of the poor and miserable, of vices and sicknesses, turned, at the zenith of his success, from the aspects that he had hitherto cherished, and opened his heart to the joys of existence. In his mind a process occurred, such as the ninth symphony describes in eternal strains. In his despair a voice suddenly cries out: "Brothers, let us sing other strains," and roars out exultingly: "Joy, fair brightness of the gods." Formerly, he knew only abandoned tramps, tattered beggars and thieves, broken-down hospital brothers. His plant-world consisted of the leprous turf in front of the Paris forts, decayed flowers, the half-withered, suburban street trees, broomlike and leafless as in autumn. And he painted this misery in miserable colours and in his own peculiar, streaky manner, especially appropriate to the subject. Now he caresses with a broad, full brush bloomingly beautiful maidens in white raiment, sunny, ornamental gardens with rich _parterres_, fresh nosegays or living flowers. He has also changed his style with his subject. It is all renovated—palette, execution, and story. I have a feeling of a secret happiness having blossomed in this artist's soul, and I rejoice in the cheerful unconcern with which, by his altered work, he makes all men privy to his _Vita Nuova_.

Odilon Redon is a completed artist. His development is ended. It came from Gustave Moreau, and it never deviated from him. He is a delightful harmonist of colours, who handles the sharp and flat notes with equal mastery, and if he condescends to paint flowers, fruits, unpretentious still life, and landscapes every one can understand, he displays naturalness, taste, and winning homeliness. But when he strives for higher expression he gets beyond his master's range of vision, and becomes purely hallucinatory. Fabulous creatures, at once Pegasus and Centaur, stagger about amongst rare flowers, which gape like bleeding wounds or grin like vampires' mouths. Monsters without recognisable organic shape, bastard combinations of parts of dragons, beetles, birds and Ashes hover or swim in an uncertain medium, which may be water, air, or ether. Dreadful human heads, bound in clusters, grow bushlike out of the ground. All this is in colour pleasing; in form, enigmatical. Gustave Moreau is always intelligible; we know the myths he clothes in forms of extrahuman and superhuman splendour. No one can make head or tail of Odilon Redon. He himself does not think at all in his unearthly representations, and they awaken no definite thoughts either, but affect us like wild faces in a fever.

Pierre Auguste Renoir is also counted among the Impressionists and Naturalists. When we see that the same designation is applied to him as, for example, to Cézanne, we can, as it were, clutch with our hand the misuse of the words, and convince

ourselves how senseless classification in art is. Renoir is certainly no painter of prettiness. He does not paint nature white and rosy, or stick beauty-patches on her face. He does not go out of his way even for pronounced ugliness. You have only to look at his two Megæras on the garden bench to be convinced of this; but beside these witches he has so much refreshing, individualised beauty, that one fails to understand how he could have been classed with Cézanne and, what is more, the routine Naturalists. His naked young woman with the mother-of-pearl flesh; his lady in a cashmere dressing-gown on the tapestry sofa; his girl in blue with the red cap, and the little sister in white; his two ladies with the roses, are simply charming. And love speaks no less from his chrysanthemums and his sunny meadows than from his men and women. He who has the same feeling as Renoir for roses and children, is not only a great painter, but also a good and noble man.

Alfred Roll is one of the most amiable figures in the art world of to-day. No one has such feeling as he for the exquisitely delicate silvery vapour of a May morning atmosphere, quivering with sunlight and saturated with dew. No one knows how to model out with such creative genius as he a human body from the daylight that flows around it in gushing torrents. In his free-light painting one breathes free from all oppression. Besides qualities which, in all ages, make a great artist, he has the little trace of corruption which makes him a legitimate son of our age. One of his masterpieces—the naked young woman who clings caressingly to the bull—awakes Pasiphaistic ideas of old classic aberration. To procure pardon for this picture, he had to do no less than paint the splendidly healthy peasant girl with the brimming milk-pail and the cow—certainly a worthy penance.

Roll is, to be sure, not always the charming, luminous painter of the milk-maid and the girl with the bull. He very often strikes other notes. Thus, for instance, in his picture inspired by socialism, which he calls “The Martyr’s Road,” he shows an old tramp who, with his back leaning against a tree, has collapsed by the wayside, has let his wallet fall beside him, and appears to be about to give up the ghost. The misery of his worn countenance already overshadowed by death, of his emaciated figure and tattered clothes are convincing. On the other hand, it is open to question whether it was good taste to paint the dying man in front view, with bold foreshortening of the outstretched legs, and with boot-soles of a terrific size, that rear up before us, in the extreme foreground, like two præ-historic _menhirs_. Roll intended to pay his homage to Maxim Gorki also. Was it from sincere feeling, or to show that he is _dans le mouvement_, and is keeping step with the most advanced of his time?

He has insisted on trying his hand at monumental decoration also. The fruit of his effort is a gigantic picture which he entitles “Life’s Joys.” He has evidently thought of Watteau, probably of the latter’s “Embarcation to Cythera.” It is the same blissful landscape with roses, trees, and water that seems, in the haze of the distance, to continue interminably until it reaches Paradise. It is the same air which the rain of blossom renders coloured and almost opaque. It is the same spring sky which we might hail with shouts of joy. The men and women, however, who give life to this Eden, are different to Watteau’s. In Roll, everything is marvellously austere and hard. His women in the foreground are naked, and partly lie in Michael Angelesque attitudes on the grass, partly sit there overpoweringly monumental. Loving couples, walking and dancing, behave as if they were possessed by wild, brutal lust. Something like a tragic current is traceable amidst this idyll. We exclaim in alarm: “Here, this very day, there will yet be murder or manslaughter?” And with the object of destroying still more the ideal note of May, Roll puts, in the midst of this fairy-tale splendour, three realistic musicians, whose clothes were bought at _la Belle Jardinière_, who will certainly, after every dance, go round with a plate and collect from their audience. Where will the nude ladies take money from to throw to them? How much more charmingly and wittily does Watteau begin his theme! Only a marble statue of a woman renounces the advantages of elegant toilettes. Winged Cupids flit about the young couples, and translate, as it were, into lyrical, rhymed verses the naturalistic prose of the gallantry exhibited. The men do not rage in brutal eagerness, but pay delicate and discreet court to their ladies. And above all things, Watteau’s infallible taste warns him against telling his stories at excessive length. As brevity is the soul of wit, so moderate compass is a great advantage in an Anacreontic scene. This should be elegant and pleasant; but the monstrous excludes elegance and pleasantness. Roll’s Titans and Cyclopses are not suitable for masquerading as Arcadian shepherds.

Lucien Simon, a painter who has been an imitator of Cottet, puts himself forward now, by an impetuous movement, into rank with him. “The Evening Gossip” unites the family round the table lamp, which lights up a number of richly animated faces with curious lights that play and flicker. “Nuns Collecting”—one old and one young nun try by gentle yet tenacious and irrefusable pressure to overcome the resistance of a well-to-do and apparently somewhat niggardly country lady, and to determine her to open her well-guarded purse. In a “Ball-room in Brittany” peasant couples, in the dress of the Celtic province, under smoking lamps emitting a yellow light, spin round, with heavy stampings, to a bagpipe tune which drives the blood into the simple dancers’ browned cheeks, and kindles sparks in their eyes. All this is stumped in broadly and luxuriously without petty dwelling on the less essential, yet with a sure feeling for what is characteristic in appearance and movement, and in a harmony of dark colours, which is as far remote from the bright tone of the style of painting in vogue the day before yesterday as a Guido Reni is from a Franz Hals, but affirms its own

justification as self-consciously as the particular note struck by a Hennar and Gustave Moreau among the moderns, of a Velasquez and Rembrandt among the greatest ancients.

Up to now, his most important creation is his “Mass in Brittany,” a work of an exquisite nature. The young and old peasants and seamen who hear High Mass standing in the bare village church, are truly and lovingly individualised head by head. Proudly renouncing pleasing externals, L. Simon has made up his mind to produce his effects only by the noblest means, viz., by characterising with accuracy these manifold types, and by the depth and fulness of the spiritual life of these pious folk here gathered together. Offence has been taken at the broadness of his execution, which already bordered on superficiality, and on the coarseness of his colour, which put one now and then in mind of the bill-poster’s newer art. He has laboured conscientiously on himself, and diminished the defects of his qualities without weakening the latter. He still continues to paint with large strokes in fresco style, but he pays attention to the solid building of his figures. He is still pronounced and unaffected in his colouring, but he avoids letting power degenerate into coarseness, and expressiveness into shrillness. Thus Lucien Simon rises slowly and steadily, though unerringly, to the lofty peaks of pre-eminence.

Jean Veber is quite a peculiar phenomenon which has not yet been deservedly appreciated. On one characteristic ground: because he never understood how to be solemn; because he seems not to take himself or his art seriously. He began as a caricature draughtsman for Boulevard papers, and only when his vocation for this peculiar province was well established, did he exhibit oil-paintings. But he was already labelled, and people continue to regard him merely as a comic draughtsman. The public refuses to allow a double renown to a single talent. Its admiration, you know, costs nothing, but it is, nevertheless, scanty with it, as if it were bringing a sacrifice obtainable only with difficulty. That is a royal trait in the sovereign mob. It is niggardly with its distinctions in order to enhance their value. The splendid Daumier also had to suffer from this coyness on the part of the public. For a long time nothing was thought of his easel pictures, and it was really the Universal Exhibition of 1900 that first revealed to posterity the fact that Daumier of the “Charivari” was one of the most important French painters of the nineteenth century. The caricaturist of our days is, as it were, the journalist among plastic artists, and we know that it is very hard for journalists to succeed with poetical creations, however brilliant. The older humorists among the painters fared better. The Dutch painters could make rough fun of the life of the populace without injuring their reputation as artists by so doing. Hogarth attained high recognition, although his clumsy, Philistine, moralising painting ranks below the works of many caricaturists of to-day. Cruikshank, however, whom I rank, without hesitation, above Hogarth, occupies, in popular estimation, a lower rank, because he put his pencil at the service of the Press.

Jean Veber is the descendant in the direct line of the younger David Teniers, the Adriaen Brouwers, and the Höllen-Breughels. From them he derives his full style of painting, his deep, rich colours, his great sureness and luxuriance of execution, his clear composition and florid imagination. He differs, however, from them in the quality of his fancy which delights in symbols replete with philosophical references; frequently in Saadic spectacles of cruelty and lust, and very often in lubricities of the Félicien Rops kind. This is the effect of the hundred and fifty to three hundred years which separate him from his more innocent spiritual ancestors.

Of the pictures he has exhibited, some are unforgettable, when one has seen them. The “Triumphal Procession” of a gigantic crowned goose through the streets of a mighty city, amid the loud applause of a populace raving mad with loyalty. The “Struggle for Gold” of a number of awful cripples tearing each other to pieces in their mad struggles for a few gold pieces that have fallen in the street; the “Sight of Terror” of a man reeling home at night, apparently after a long drinking-bout, in whose eyes the houses and monuments take weird, living physiognomies, are most impressive utterances of the misanthropic pessimism, the satiric bitterness, and the humour of Veber, also, to be sure, of his predilection for the weird, the ghostly, and the horrible.

These qualities are repeated in almost all his works up to now. The greatest and most pretentious, “The Machine,” offends through the daring symbolism by which he illustrates the murderous power of woman over the sensual man. On the other hand, “Sunday Morning” is a bit of life observed with exquisite humour: a barber’s shop in the village, with a soaped victim under the nimble but not too considerate hands of the beard-shaver’s wife, whilst some other customers, of unspeakable comicality in looks, bearing, and dress, smoking, dreaming, staring, or chattering, wait their turn on the bench by the wall. “The Hermit and the Female Faun” is a scarcely orthodox, but keenly witty modernisation of the old theme, the temptation of a saint, which these square-toes of painters for the past five hundred years have cherished with predilection, since it permits them to present quite heathen sights with a hypocritically contrite air. “The Three Good Friends” are of refreshing cheeriness. The ugliness of these contented louts is touching. The painter, by way of exception, exhibits them without malice, rather sympathetically, with a plea for extenuating circumstances. But generally, his wit belongs, in the main, to the species of evil-speaking. We laugh over the malice with which a sharp-tongued observer characterises our fellow-creatures, but we feel quite well that it is not the better man in us that laughs. Jean Veber loves to

mock at mankind in goblin fashion. He sees men perpendicularly pushed together like a telescope, horizontally drawn out as short, square gnomes with pumpkin faces, who, pleased with themselves and unconscious of their grotesque ugliness, strut about as if they were so many Apollos and Dianas. Thus Jaurès appears with mouth agape and flourishing gestures on the rostrum of the Chamber, at the foot of which breaks a flood of blustering deputies in stormy session. So in a parody of Rubens' "Kermes"—itself of the nature of a parody—villagers resembling sacks amuse themselves with feasting and drinking and amorous tendernesses which are calculated to disgust us with love itself. A grandly rigged-out, inexpressibly laughing lady in a low-cut dress between two greybeards paying their dreadful court at an exquisitely appointed supper-table; a physician at the foot of the bed gazing with devotion at the tongue, put out quite a yard, of a rich, fat lady-patient; a short, stout woman in a fashionable tailor's _salon_, whom the slenderest of the show-room girls is trying, with "cake-walk" movements, to fit with a dress like an umbrella-cover, are amusing in their stupidity and ugliness. On the other hand, I cannot follow Jean Veber further when, in "Family Joys," he tries to make the newborn child ridiculous—a shapeless bit of sprawling flesh, red as a crab, which the midwife has brought from the bed of the exhausted mother at the back of the room, and is exhibiting in triumph to the gaping family. He should keep his sacrilegious hand off the sanctity of this event.

The happy combination of a faultless dexterity with an arrogant, creative humour, in which I would only like to see a trifle less admixture of gall, renders Jean Veber's an artistic physiognomy that is far more interesting than many an idol to whom altars are raised.

Emile Wéry, a young and fortunate man of talent, began his career with a great success. His view of an Amsterdam canal made a sensation, and gained the great prize at the "Salon." Perhaps a little stupefied by this triumph, he kept for a while to the style of his prize picture, so that there was reason to fear he would early stiffen into a manner. He painted, for instance, an attractive triptych, which presents Venice to us in her three characteristic decorations: the narrow _Calle_, the slender _Rio_, and the splendid _Canal_. But what we cannot anyhow fancy absent from a view of Venice—the southern sky, the gleaming sun, and the warm tints of her old stones and tiles: these are here altogether lacking. It is all grey, northern grey. It is the same tone as in the prize picture of Amsterdam. As Faust found Helen in every woman, so Wéry then found apparently Dutch water-towns in every town, and Amsterdam herself in Venice. People think they are flattering the city on the Amstel, when they call it the Venice of the North. Wéry reversed the compliment: to him Venice was the Amsterdam of the South. How true it is that we see not with the eyes but with the soul!

The South, combined with his youthful impulses to development, was to save him from the danger of mannerism. Though he had seen Venice with his Amsterdam eyes, and found in the azure and gold of the city of lagunes the leaden waters and mist of the north, further south, in the light, he bathed his eyes clean from the muddiness of higher latitudes. In "Sicily" a girl's brown head, with red cloth in the midst of a cluster of dark green-leaved branches with ripe oranges, flashes and glows the whole noon of the magic island, which this vigorous woman—a golden fruit among golden fruits—is to personify. But even after his return home he still remained drunk with the light of Italy. In a new picture, "The Little Ones," we are once more in a harbour on the North Sea, at a place where Wéry's talent takes its root. Flaxen-haired youngsters are playing round a boat; one of these, a little chap in wide, flapping trousers, is droll enough to eat. Water, sky, and river-bank are wedded in silver sheen, and over the whole reposes a happy sense of comfort, in which the artist's cheerful heart is disclosed. He has happily got over his first crisis. Now his artistic career lies smooth and sunny before him.

Anders Zorn.—This Swede is a virtuoso of amazing skill. He delights in marvellous effects of light, in surprises, in fixing fugitive views. His pictures are snap-shots pitched on the canvas with an almost mechanically smart brush. He is a concert painter possessing talent. He is one of the great corruptors of young artists nowadays. It is so fascinating, by a few wild, staggering, nimble strokes of the brush, to conjure up a human figure or a scene. But this method leads to the worst superficiality, and attracts most the lazy fellows who wish to save themselves the trouble of learning properly the principles of drawing and painting. Zorn did not make the thing easy for himself. He honestly and industriously acquired a thorough mastery of technique before turning to execute his dazzling little pieces. He may allow himself to storm and rage over the canvas, for accuracy has become automatic in him. In spite of this haste, every line is on the right spot, and though people often regret that he only hints instead of stopping and deepening, nevertheless it is continually said: "The man knows how to build up a figure or a group." His imitators, however, have caught only his daubing, and with them superficiality is but a bold excuse for ignorance of drawing.

Ignacio Zuloaga.—Spain can at the present time boast of a number of painters who might call out to their greatest predecessors among their countrymen the proud _anch'io_. What characterises them is a peculiar, almost mad energy in drawing, which appears in all details, in the living and the dead, not only in the mien and attitudes of men, but in the sharp profile of every leaf and blade of

grass, in the bold relief of every stone, in the aggressive self-consciousness of every being as of every thing. This energy is not to be learnt. One has it or one has it not. There are foreign painters in plenty, whom Spain has bewitched, and who their whole life long recount nothing but bull-fights and processions, shepherds and gipsies, _cigarreras_ and _manolas_; but no one who knows the genuine Spaniards will confuse these with the foreign imitators. There is, for instance, the excellent Jules Worms. He has been exhibiting Spanish scenes uninterruptedly for forty years. They are always nicely painted, prettily conceived, and pleasantly executed. As contributions to knowledge of the nation they are not without value. They have gained him all official honours, and he passes for an undisputed master of his particular province. And yet how un-Spanish is this life-long Spanishness of Worms and all his rivals and imitators! It is as smooth, licked, tricked up, entertaining, and banal as the railway novel of an inquisitive but superficial globe-trotter. It is a conventional comic-opera Spanishness, a theatre decoration for scenery, with groups of costumes for living figures. It lacks the power, the stern virility which distinguishes the Spanish painters, even those of the second rank, and gives them a family likeness to their great ancestors, Valdes, Velasquez, and Ribera.

The most typical of these modern Spaniards is Ignacio Zuloaga, and the most typical, perhaps, of his pictures are the three sketches from Spanish folk-life, which were exhibited a few years ago in the “Salon.” An Andalusian, young, thin, and delicate, with a little crumpled face of apish ugliness, with a supple body that seems to whirl, stands in front of a poor mirror, and powders her face with coarse rice-powder, as though she were sticking on a comic Pierrot-mask, whilst her sparkling eyes testify that she wants to make herself thoroughly beautiful for the bull-fight. Then we see her in loud, bright ribbons, with the inimitably draped mantilla over her head and shoulders, passing quickly through the street, greeted by two old connoisseurs with highly-spiced endearment. On the third occasion she or her sister goes with a diabolically piquant young gipsy girl, whose insolent laugh discovers gleaming wolf’s teeth and turns up the sharply-curved nose, rapidly over the ground, probably to keep a Sabbath, from the expression of both grimaces. This is warm life such as not often glows on painted canvas. Zuloaga has felt his Andalusian wild creatures to his finger-tips, and renders them with all their _garbo_ and _salero_—the German _Schneid_ and _Mumm_, and the French _montant_ and _mousseux_ are weak translations of this expression. The pictures seem to be painted, not with mineral colours and oil, but with sulphuric acid and lunar-caustic. These ladies are young witches, of whom you would imagine that by touch they must give an electric shock like a torpedo-fish, that, if they open their mouths, red mice will jump out, and that it must be more natural for them to ride through the air on a broomstick than to make use of their legs in the usual way. In the piquant ugliness of their faces, made up with a thick layer of rice-powder, in the gorgeous Sunday array, in their attitudes and movements, in the gipsy-girl’s bestially insolent grinning and winking, in the lustful glances and laughter of the men, there is a fulness of hot life, an insolent sensuality such as is only met with in Brangwyn’s youthful works. One often heard the name of Goya pronounced before these pictures. It is indeed the same temperament, but another outlook on life, another art. Zuloaga has much of the cutting virtuosity of his great countryman; but he is no embittered critic of the world, rather a laughing Sunday’s child who enjoys life with all his senses.

And, above all, his pictures are patterns of a domestic art which, through its unreserved sincerity, is at the same time an universal art. For it reaches so deeply that it penetrates beyond the special type to humanity in general.

XIII

AUGUSTE RODIN

Rodin’s place in present-day art is a peculiar one. Auguste Rodin has been raised to the dignity of a test for decadent ways of feeling. We admittedly call “tests” or proof-objects the objects (for the most part, the shell-armour of diatoms or the scales of butterflies’ wings) on which the magnifying power and exactness of analysis of microscopes is tested. By Rodin the fanatics and snobs of insane tendencies test the genuineness and power of symbolico-mystic sentiment. What do you think of Rodin? Do you admire him? Good: then you need further only adore Besnard and rave about Félicien Rops, and you can claim to be numbered with the newest, without respect to the colour of your hair or opportunist baldness. You do not admire Rodin? Then sneak whimpering from our league. You are no decadent. No beauty with her hair combed in the Botticelli style will love you; Mallarmé will not write poems, nor will Nietzsche philosophise for you. Nobody will invite you even to a Black Mass. Go to the Philistines; you belong to the narrow-minded community, which is a herd of ruminants.

It would be intelligible if the provocations of the shriekers, who, after the manner of howling dervishes, dance and rave round Rodin, were to induce men to take a violent part against this very man. Justice, however, demands that people should suppress their natural tendency to make him responsible for the ear-piercing din of his drummers and trumpeters. After all, he cannot help a horde

of swindlers and silly people making a vulgar disturbance about him and his works. If we are to judge him, we must try to forget that critical offenders, by invoking his name, continually outrage the sense of æsthetic decorum and artistic conscience. Rodin is, in fact, not the originator of this shameless proceeding, but the victim of the æsthetic Catiline conspirators who have got possession of him, and are pushing him on before them, so that it looks from a distance as if he was their leader. Rodin is not the least _cabotin_. He is of a modest, homely nature, but no strong character; and he has not been able to stand against the suggestions of those whose interest it is to eulogise him, who have for so long chattered his poor head full of their most brain-firing, æsthetic doctrines, and most profound interpretations of his alleged purposes, until he has lost his own personality, and makes the most desperate efforts to become like the picture which his critical Corybantes present of him to the open-mouthed gapers.

What has raised Rodin to an article of faith among the degenerates is three peculiarities. First, the choice of his materials, which appeal to the mysticism and sensual psychopathy of his body-guard of degenerates; secondly, his technique, which deviates from tradition in childish, would-be-original whims; and thirdly, his mistaking the natural limitations of his art, which he wants to make say things for which sculpture possesses no means of expression. These traits are proved by a short review of his principal works.

The production which first brought him the custom of the decadents is a composition which was devised for the gate of Dante's _Inferno_. He had worked at it for decades. After a few fragments, which were to be seen in 1889 in the Universal Exhibition at Paris, he showed the whole in a plaster model at his private exhibition of 1900. It is inspired unmistakably by Ghiberti's door of the Baptistery at Florence, but stands in intentional contrast to it. The great Quattrocentist depicts life in Paradise; Rodin's intention is to show existence in Hell. The framing and articulation of the work, and nearly all its details, were rendered with organic necessity from this starting-point. The door is cut up into panels, which are not divided by stiff, geometrical lines, but, just as in the case of Ghiberti, are at the same time immediately separated, and again indirectly connected into a higher unity, by a feature of the picture itself, _e.g._, a cliff, a man's figure, a piece of building. In every panel an act from the _Inferno_ is played. The parts, in the majority of cases indicated only in a sketchy way, betray strong, indeed mainly perversely directed, erotic imagination, and the gift of exhibiting human bodies in the movements of passion. Of course, Rodin, too, has not dropped down from heaven, but is the descendant of easily demonstrable spiritual forefathers. This sculpture of violent action, a particular development of French art, and in no way connected with the Laocoon, as one might easily make the mistake of assuming, has its first master in Rude, whose power is revealed most grandly in the "Marseillaise" on the Triumphal Arch at Paris. Rude's successor and continuer is the incomparable Carpeaux, who, as is most clear from his group "The Dance" at the Grand Opera, in place of the wild heroes of his model and master, substituted wild Bacchantes; who celebrated, instead of self-oblivious joy in sacrifice in the service of rugged duty, self-oblivious intoxication in a debauch of sensuality, but represented a life of excitement no less sublimely and no less ravishingly than the former. Rodin is closely connected with Rude and Carpeaux. With him passion descends a step lower still to the uncivilised and dissolute. Heroic with Rude, voluptuous with Carpeaux, it is Satanic with Rodin. The "Gate of Hell" exhibits rows of naked women in all the situations and occupations of the witches' Sabbath, when it is most devilish. Fits of hysteria shake and twist these bodies, every motion of which betrays shocking aberration and eager Sadism. The patients of the Salpetrière or the Atlas of Pictures edited in this _clinique_ (_Iconographie de la Salpetrière_) evidently served him for models. And from him, be it incidentally observed, Alexander appears to have drawn his inspirations with the aggravating circumstance that he clothes Rodin's naked women in rich, modern toilettes, and by this artful means makes them even more obscene. The feminine genius of tragedy in Rude is inspired by Tyrtæan war-songs. Carpeaux's two female dancers have drunk sparkling wine; Rodin's demoniac women have swallowed pills of Spanish-fly. Thus it is clear that Rodin must be dear to all wanton schoolboys, impotent debauchees, and incipient spinal sufferers.

If the "Gate of Hell" is an illustration of hystero-epilepsy and feminine Sadism, so, too, is a marble group which he exhibited in 1898 of Masochism. A naked woman with horribly glacial, unmoved features sits leaning against a wall of rock. A man, apparently growing out of the earth, kneels before the merciless image, embraces its knees with despairingly imploring gesture, and presses his head against its body. This is supposed to show man in an ecstasy of desire, subjugated by the sexual power of woman. I can only say that a copy of this group would excellently suit as a frontispiece for an edition of the collected works of Sacher-Masoch. Other smaller groups of Rodin, which he exhibited in the Champs de Mars Salon, hint at other forms of morbid sensuality on which I am reluctant to dwell. They all disclose a sub-soil of corrupted sensuality in the artist's soul. That secures him influence on natures in harmony with his own. The degenerates who revel with Baudelaire in love of corpses, and with Félicien Rops in highly-spiced lewdness, find the same excitation in Rodin, and they intoxicate themselves with his ecstatic lasciviousness just as with the unnatural or madly exaggerated eroticism of their other fleshly poets and painters.

So much for Rodin's choice of themes. Now for his technique. One of his singularities is that he loves to astonish people by a crude, external contrast between a block of unworked marble and the most exquisitely finished and sweetly polished sculpture of bodies. He takes a great cube out of all proportion, which he leaves as the labourer hewed it as it came out of the quarry; and he works a little corner of it into a head and body polished with the utmost nicety. In this way, the figure grows out of, or into, the natural stone. Looked at from three sides, a lump of rock or stone is presented to the eye, only on the fourth side the work of art is revealed, blooming, as it were, in the wilderness. We may describe this manner as the sculptural form of mysticism. The association of ideas which Rodin wishes to awaken by this device should make the idea dawn on the consciousness that here, before our eyes, a miracle of creation is being accomplished; that we surprise the very incarnation of the stone; that we are witnesses of the birth of organic form from the stiff, lifeless original matter, and may observe how the figure, still half imprisoned in chaos, struggles painfully forth to a form instinct with life. There are subjects for the representation of which Rodin's style would have been a happy invention: perhaps the creation of Adam from a clod of earth, or the story of Deucalion and Pyrrha, or a Promethean motive. But its uniform employment for all possible subjects—on banal busts or groups which have no reference to creation or genesis—causes the manner to be recognised for what it is, a snatching at effect by means of eccentricity. Of course, this striking and easily imitatable freak has founded a school. No American or Scandinavian who wants to frighten the Philistines with "modernism" neglects to exhibit a piece of, for the most part, wretched sculpture as tiny as possible on a clump of unworked rock as Cyclopean as possible. It cannot be said that the joke is cheap. The unhewn block of marble often represents a pretty stiff value in hard cash, in any case a higher one than the corner that has been chiselled. One can only say that any idiot can succeed in using a ton weight of stone as a support to a figure the size of a man's hand.

Yet, in conclusion, it is a comparatively harmless folly which a practitioner can remedy with a few strokes of the saw. It is sufficient to cut the sculpture off, and give the rough block to a needy sculptor. Far worse, because it is incurable, is the æsthetic principle to which Rodin pays homage in the technique of his more important works especially. He is, to wit, an Impressionist. A line of motion in an individuality or group interests him. He seizes it, shapes it with convincing truth, with an emphasis exaggerated—certainly purposely—to the point of caricature, and neglects everything that does not serve to illustrate this line of motion. Sculpture, however, is an art which does not allow any Impressionism. It demands, according to its nature, a perfectly accurate formation of the whole figure, and simple honesty in reproducing the phenomenon. This can be proved by a theory of perception. Sculpture fills space and is of three dimensions; it addresses itself, in the first place, certainly to the eye, but also to the sense of touch. It calls for stereoscopic vision, and is, at least in theory, capable of further proof by a second sense. Now just this theoretic possibility of further proof, by means of the sense of touch, has the prohibitive effect, that fancy feels no inclination to supplement the image provided by the sense of sight. In works of painting we add in our mind much which is not optically given in the picture. In plastic works we have not this psychical habit, because a testing with the hands is opposed to the free, inventive power of the imagination, and makes us at once recognise what has been given in space, and what has been added by our imagination. On this ground, there is no place in sculpture for intentions or hints. That is enough for a rough plan, but not for the finished work. Rodin, however, stops at a stage of completion, which may, at best, pass for a promise, but never, in any case, for an achievement. He deliberately breaks up the frame of artistic form. He would fain work with the habits of the painter's eye and the painter's hand, and he applies this treatment to the statute, standing free and exposed to examination from all sides.

The confused lines which represent the draughtsman's first sketch (_ébauche_) have their special charm and meaning on the surface to be painted. If, however, you translate them into three dimensions, if every careless movement of the artist's hand, either still feeling its way or hurrying on, is finally fixed in clay or bronze, something inadmissible results, which has no right to proclaim itself a work of art.

Such a seeking after the right expression, such a stammering in metal is Rodin's monument at Calais, which represents the burgesses of Calais with the rope round their necks, standing before Edward III., who had successfully besieged that city, and asking for mercy. The crushed spirit which Rodin tried to express is actually visible in the group; but the figures which express this emotion are formless from head to foot. The limbs are rugged boughs; the bodies violate the laws of anatomy; the whole group is on the stage of technical perfection reached by the idols hewn from wood by the South Sea Islanders, and is far inferior to many a pre-historic picture on mammoth's teeth and stag's horn, which may be seen, for instance, in the Museum of St Germain. Rodin's domestic trumpeters promptly proclaimed this for a work of lofty genius. The Corporation of the town of Calais, who had ordered it, dared not reject it. The decadents' reign of terror—it was in the year 1895—was then in all its fury. The whole Paris Press was in the power of the dictators of the Chat Noir, and the poor Calais burgesses, clever men of business, but very uncertain in questions of art, feared to be jeered at as wise men of Gotham, if they rebelled against the æsthetic edicts of the tyrants of Paris criticism. But they blush for shame and anger whenever they pass by the memorial, and now, when the reign of terror of decadent criticism is

over, it will probably not be long before the Calais people pluck up courage enough to have Rodin's bronze abomination carted off from the public square, and withdrawn, in a store-room in the Town Hall, from the scornful eyes of strangers.

A counterpart of the Calais group is the design for the Victor Hugo Memorial, which was for the first time exhibited in 1897, and again five years later, when it was somewhat further advanced. This design also showed nothing but intentions. The poet is sitting naked by the seashore. The last shallow wave washes gently up to his feet. Two female tutelary figures—perhaps History and Legend, or Poetry and Philosophy—are flying to him horizontally at the level of his head and whispering secrets in his ear. As a mere intention, the composition might be allowed to pass; but nothing of execution, practically, was yet to be seen. Victor Hugo's body was not modelled; the flying female figures could not be distinguished, either from a distance or on close inspection, from cloud packs, or the fantastic animal figures of Gothic gargoyles. Nevertheless, Rodin disarmed intelligent criticism by declaring that the work was a mere sketch. Of course, he could no longer be fairly reproached with its shapelessness, and people had to content themselves with waiting for its completion, which has not come to pass up to now.

Rodin has overstepped, in his Balzac Memorial, which he first exhibited in 1898, the very extensive limits within which his silly aberrations might have been borne. Master Shallow, who tolerates much, could not tolerate this work, and broke down under its crushing exaction. When the public saw this provocative monstrosity, it broke out into that uncontrollable laughter, whereby the outraged intelligence of mankind revenges itself with primitive force for restraints that it has long suffered in silence. In the face of this result, the Committee of the French Union of Authors, which had commissioned the Balzac Memorial, resolved unanimously to decline it. In vain the Condottieri, who had usurped supremacy in art criticism by the most unscrupulous methods of conspiracy, violence, and oppression, made desperate efforts to maintain themselves. They were powerless against the armed rising of sensible people who had at last come to themselves. Their tyranny was vanquished, and they were swept away. They might still talk all sorts of twaddle about the stupidity of the masses, and, in impotent rage, hiss at the victors the well-known shibboleths, "Philistine," "provincial," etc., but this final, faint-hearted nagging sank unheard in the unanimous cry of scorn from public opinion.

Rodin has represented Balzac as, jumping out of bed in the morning, he wraps himself unclad in his monk-like dressing-gown, without even putting his arms in the sleeves, irresistibly impelled to hurry to his writing-table in order to fix the thoughts of which his creative brain is full to bursting. Agreed: that, again, is the intention which Rodin might, perhaps, have secretly put into the figure. What the eye really sees is a sort of tree-trunk, hewn in the roughest manner by a woodman with an axe, which is surmounted by a hideously swollen tadpole head on a goitred neck. Malicious Parisian wit has exhausted all the droll comparisons that this monstrosity can suggest to flouting humour. People have called Rodin's work a meal-sack, a carved potato, a snowman made by a cheeky schoolboy, an unpacked statue, a stalactite, etc. The work is all that, for it is nothing at all; but it is pre-eminently the conclusive refutation of Rodin's æsthetics. For it is the highest expression, and, on that account, the unintentional parody, of his impressionist technique and of his third mistake, viz., ignorance of the limitations of his art.

Rodin worked at this wretched piece of work for ten whole years. First he read all Balzac's works; then he made a journey to Touraine and spent months there, so as to absorb the human environment from which Balzac took so many of his models, and to become permeated with the feelings and impressions with which Balzac may have satiated himself when composing—all this to make a human figure which was to be the likeness of a man whom many people now living have known in the flesh. After these preliminary studies, Rodin finally proceeded to form his Balzac. His head was to be "a synthesis of his works," his physiognomy was to be summed up "in an eye that looks on the _Comédie humaine_ and in an upper lip that is curled in contempt for humanity." So said Rodin himself in several interviews which were published at the time when his statue was exhibited. He was then merely repeating what the twaddlers of Montmartre had chattered to him. It would be easy to make jests about this inflammation of the brain, but it is not worth even cheap raillery. It is quite enough to establish, soberly and drily, that Rodin, like a child or an idiot, aimed at something impossible. Sculpture cannot furnish any "synthesis of Balzac's works." Nature herself cannot, in the sense that Balzac himself, when he was alive, did not synthetise his works, in his externals, in his physiognomy. He had perhaps the head of a man of mark, but there was assuredly nothing in his face to show that he had written the "Physiology of Marriage," and not written "La Chartreuse de Parme" (Stendhal). Rodin imagined that a portrait-statue could quite alone, merely by its own means, supply the place of a biography and a psychological and literary characterisation of the person represented. This patent lunacy was necessarily bound to end, as it has ended, in a mad caricature.

"The Thinker," a colossal statue which was exhibited in 1904, is almost as bad an aberration as Balzac. It is a gigantic enlargement of a little sketch that one saw many years ago over Rodin's "Gate of Dante's Hell," in the confused and scarcely indicated unborn _foetus_ lines of which confident devotion might imagine all possible promises of future splendour.

The promises are realised in “The Thinker.” He who still wishes to shudder with foreboding in the presence of the finished work will be at liberty to do so. It will be the same sort of man who grew enthusiastic over the “Balzac,” before which every criticism of intelligent—not “intellectual”—men dissolved into unextinguishable laughter. “The Thinker” is brother of the “Balzac,” only it is not so comic, for it is not dressed in a meal-sack, but is naked, and the bared human body, when misshapen, excites in a spectator of unvitiated taste, not cheerfulness, but discomfort, which may even rise to loathing.

“The Thinker” is not only naked, but also flayed. Its anatomy is executed with obtrusive importance, without the covering epidermis with its vital warmth. The enormous exaggeration of the muscles, the impossible assertion of strength which is expressed by the extreme contraction of all the muscles, therefore also of the counteracting muscles, are well-known features of sculpture in its worst period of decline. There is still, however, a distinction between Rodin and the _rococo_ sculptors, who confused fleshy tumours over the whole surface of the bodies of their statues with the power of portraying artistically. At any rate, the latter had a correct knowledge of myology, or the subject of the muscles, whereas Rodin’s anatomy is shockingly inaccurate. I really do not think much of Lorenzo Matthielly’s groups at the Vienna Hofburg-gates; but in the face of Rodin’s monstrosity I apologise in my heart for all the objections I have ever made against them. At any rate, with Matthielly every muscle occupies its proper place. Rodin, however, invents muscles which do not exist, and never did exist. Two mighty ridges, ending below in sausage-tips, run down the “Thinker’s” back, which are perhaps intended for the two _longissimi dorsi_; in this case, however, they are howling blunders as regards their attachment, their whole course, and their form. The muscles of the forehead and temples are treated quite as arbitrarily as those of the back. Where nature only recognises thin cutaneous muscles and ligatures, there Rodin puts bumps which remind one of blood tumours after blows from a club, and impart to the face the appearance of evil _Verschlagenheit_; not, as Fritz Reuter says, in the sense of craftiness, but in that of receiving a sound cudgeling. As a record “The Thinker” stands on the same level as the anatomical plates in Japanese manuals of the healing art of the time of the Shoguns.

This, however, is not yet the worst; the intellectual element fares even worse than the bodily one with this oaf who calls himself so pretentiously “The Thinker.” The flayed man sits crouching, with a distinctly crooked hump, on a sharp-edged block of stone. His toes claw convulsively into the ground. He holds a clenched fist before his mouth, and seems to bite it fiercely. His bestial countenance, with its bloated, contracted forehead, gazes as threateningly dark as midnight. He who has to interpret the figure without the help of a title will, from a back view, conclude it is some one writhing in agony on the rack; and from a front view, a criminal meditating over some foul deed. Its mien and bearing would suggest a designation such as “The Fallen Titan,” “Lucifer’s Rebellion,” or “Cain before he murdered his Brother.” The last thing which one would think of would be to look for a mind working behind this bulgy forehead, or to imagine that thought was supreme in this body seized by a spasm of rigidity in all its muscles. The name given by Rodin to this wretched performance sounds like a scoff or a calumny, and it might be thought the misled artist, robbed by his fanatics of all self-criticism, had intended to make a malicious parody of Michael Angelo’s _Pensieroso_.

Rodin himself, by his portrait busts, makes it possible to gauge the whole insincerity of his pose as a profound thinker, and his genius-playing arrogance; for instance, by that of Octave Mirbeau, and, still more easily, by a female bust which was exhibited at the same time as “The Thinker” monstrosity. With the exception of the folly, which is, moreover, not too obtrusive, that a piece of the rough block was allowed to remain on both shoulders, there was not the faintest feature in the bust that could differentiate it from a severely classical, coldly correct work. Here he had to satisfy a lady client, and he was irreproachably smooth, executed all the details lovingly, and produced a soft, delicate flesh, to which the elegant Injalbert might sign his name. If one were desirous of making an objection to this pleasant bust, it would, at worst, be that it is too sweet. He becomes the destroyer of all form, the bungling sham-Titan, the inscrutable philosopher, dramatist, and lyric poet, whose eye rolls in a fine frenzy, and who, in the throes of his fever to create, confines himself to hurried indications—he becomes all this only when he works for his bodyguard of sympathetic sensitivism.

How future generations will laugh over all this buffoonery of “nerve art”! Only, indeed, when it comes to know the comments of contemporary “intellectuals” in addition to the artists’ silly bungling. For the former will show them in a way to excite sympathy and amusement what devastation the deafening babble of a band of gossips, dreadfully ignorant of art and innocent of any feeling for beauty, could produce in the taste and thought of a large majority, which honestly yearns after æsthetic education, but, on account of a lack of trustworthy traditions and adequate instruction in art, has not sufficient self-confidence to set up the promptings, however obscure, of their own feeling against the impudent dictates of presumptuous arbiters of taste.

Mysticism and sexual psychopathy in the choice of themes; Impressionism and incidental eccentricities in technique; overstepping the limitations of his art, have made Rodin the great man of the fellows who for some two decades have set the fashion in art and literature. By these three peculiarities, to which he owes his spurious celebrity, he will be ruined as an artist, whatever the success

he owes to puffing may be. And that is lamentable, for Rodin is a genuinely gifted sculptor, who created beauty when he did not yet think himself bound to work out of gratitude to the “young” journals. Unfortunately, it is extremely improbable that he will now find his way back to that simplicity and naturalness in which salvation is alone attainable. There is no return from Montmartre, not, at any rate, for an old man who has climbed this height and accepted with passionate earnestness all what he saw and heard there in advanced years. Young people who are still capable of change, in many cases awake from the idle dream of Montmartre æstheticism. Nature does not vouchsafe to the old to begin a new life.

XIV

RESURRECTION

BARTHOLOMÉ

I do not want to speak of Tolstoi’s novel, but of a work of art—great, at any rate, materially, as a statue—which every pilgrim to Paris will, I suppose, wish to see, viz., the monument which Bartholomé dedicated “To the Dead,” and which is to be seen in the cemetery of Père Lachaise.

It is interesting in so many aspects that one might devote to it a monograph as thick as a book, which would send out suckers over the whole domain of æsthetics and the history of art. Never do I feel so painfully the inadequacy of a short essay as when I proceed to handle a subject so rich in connections. It is impossible to exhaust it in this form, and it is painful to leave it as a fragment. One appears limited, whereas one is only restricted. We must satisfy ourselves with indications which will easily be looked upon as superficial, though they are merely terse. What is thought out as a proof takes the form of mere assertion, and in cases where we should like to convince, we must think ourselves successful, when we have incited the reader to kindly co-operation—which, however, goes for the most part its own way.

This pious ejaculation will make it easier for me to accommodate myself to the conditions which have been imposed on the short essay.

Works of sculpture in public places, which are neither monuments nor ornamental buildings, viz., such as are not intended to call to mind special events or particular individuals, are something novel in the development of high art. Antiquity knew only monumental creations which had their origin in patriotic sentiments. We have to bear in mind that religion in ancient communities constituted a part of patriotism, for there were no gods for mankind in general, but only gods for a particular people or a particular state. When Socrates had to drain the cup of hemlock, it was not because he had sinned against Olympus, but because he had given offence to Athens in the person of her tutelary divinities. The Battle of the Giants and the Frieze of the Parthenon, the Pallas Athene of the Acropolis and the Olympian Zeus, were felt, by those who gazed on them and for whom they had been wrought, as images from the past and present of their race. Even the “Laocoon” and the “Farnese Bull” were so regarded: a distinction between the legends of their race and accredited history, nay, between theology and politics, did not exist in the consciousness of the multitude at large, or even in that of the select few. The god made of ivory and gold was the public worship of a living being who was invested with high rank in the commonwealth, and the Olympian victor to whom a statue was erected entered into mythology as a comrade of Hercules, Theseus, and Perseus.

Religious art was the only public art known in the Middle Ages. If material political interests swayed the minds of communities in Pagan times, when the nations became Christian the supersensual, _i.e._, the salvation of the soul, became the great concern of the individual as of the community. Patriotism disappeared from the domain of emotion; what took its place—the pride of town, or class, or guild—was merely delight in material possession, or, if you like, a sort of vulgar dignity without any ideal background. Faith was their only sentiment, piety the artist’s sole impulse from which genuine creations could spring. It followed, therefore, that religious art—the only monumental art then in existence—attached itself to sacred places, and subordinated itself to them as really mere accessory decoration. Without resting on architecture, sculpture stood on its own feet only in the Stations of the Cross on Calvaries, but, even in this case, it had no object of its own, but served a definite purpose of worship. The beginnings of a public art which grew out of an abstract thought of the community—one not of a religious but of a temporal, of civic nature—are scanty and dim. As forerunners of such an art we can claim the Roland Pillars of the Free Towns—the symbol of their civil and criminal jurisdiction—with their indistinct, historical background of dim memories of Charlemagne as the legal source of municipal liberties, and perhaps also the Byzantine Lion of Brunswick.

The Renaissance was the first to create a monumental art that was to serve no practical, religious, or dynastic purpose, but one purely æsthetic, from which people looked for no strengthening of ecclesiastical views, no increase of authority and, through that, of power in a prince or government, but looked, in fact, only for delight in beauty. Renaissance art, I admit, rich and free as its development was, also remained thoroughly under the influence of mediæval traditions, and knew no other range of themes than those derived from the Bible and Classic mythology. Even worldlings among the artists, who had outgrown religious ideas, drew at least their stories from the New and, even more commonly, from the Old Testament, or from pagan mythology, which was familiar only to the educated, and to the multitude at large was meaningless, and devoid of life. A scholastic pedantry hung about such works as Benvenuto Cellini's "Perseus," for instance, which prevented the masses from appreciating them fully. It was not, however, done from haughty disdain, for monumental art—the art of the streets and squares—appeals indeed to the masses. The modelling, on the one hand, of what is purely human, which appeals to feelings in every human heart, and is, therefore, understood by every man; on the other hand, of a subject, well-defined in time and place, which must be familiar, at any rate, to contemporaries and residents: this degree sculpture attained only gradually and late. The Goose-man of Nuremberg and the Brussels Mannikin are instances of local Realism; Tadda's "Justice" at Florence and Michael Angelo's "Pietà"—these in spite of their religious relations are examples of universal human Idealism. It is characteristic of the timidity of sculpture, even in its proud epoch of the Renaissance, that it dared not cast itself adrift from presenting what was of immediate utility. It thought it needed an excuse for stepping out into the market-place before all the people. It found it fairly in supplying towns with water. It created fountains. These are the first and, for a long time, the only monumental works which were suggested neither by religion nor by loyalty to some dynasty; which aim neither at immortalising the memory of a particular event, nor at refreshing the schoolboy knowledge of the more liberally educated, but embody, without any pre-possession, a purely artistic conception of form fulfilled and animated with subjective emotion. The stages of development of the monumental fountains, which pretend to be mere sports of untrammelled fancy on the artist's past, extend to the present day, in the latest phase, in which the fountain is not really intended to distribute water, like Sluter's "Fount of Moses" at Dijon, or Jean Goujon's "Fontaine des Innocents" in Paris, but uses the water only as a decorative element, as Donner's fountain in the market-place of Vienna, or Reinhold Begas's Neptune fountain in the Berlin Schlossplatz.

We must come down to the last century to find at last a monumental art of universal feelings or thoughts, still, for the most part, modestly cringing under the protection of architecture, as groups on pediments of palaces, theatres, and exhibition-buildings, and taking possession of the public square in full independence only in the last decades. Historical works, even of an universal, impersonal sort, such as the numerous war-memorials in Germany and France, the _risorgimento_-monuments of Italy, the patriotic battle-memories in Switzerland—do not come under consideration here, but only abstract works such as Bartholdi's "Freedom enlightening the World," at New York, or Dalou's "Republic as the Protector of Labour and Culture," in the Place de la Nation, at Paris.

Even these works still continue to show a birthmark, which betrays their origin from the sculpture of purpose, for Bartholdi's gigantic statue is a lighthouse, and Dalou's "Triumph of the Republic" belongs to the fountain series.

On the other hand, Bartholomé's "Memorial to the Dead" is as free from every idea of commonplace utility as any mouldings for the rooms of a house. It originated in the artist's emotion, and had, at its birth, no other purpose than that of relieving its creator by the gratification of an impulse. What was to become of the work after it was finished is a question Bartholomé probably never asked himself at all. Perhaps he resigned himself to the thought that it would pass a pensioner's existence in some museum or other. In any case, carelessness as to what use would be made of it left him entire freedom as to the form it should take. And now he had the unexpected happiness of the work being purchased by the city of Paris, and placed in Père Lachaise. This has been the first instance, as far as I know, of a purely subjective, monumental work capturing a public position without this being justified by a practical service to the community, without embellishing a building, without satisfying any religious need or patriotic feeling, without immortalising any historical reminiscence, without glorifying any event or individual, but basing its claim to the grateful attention of the people at large only on the grounds that it attempts to embody in beauty an elemental emotion alive in the masses, that is to say, a real, common interest of moral order. The work may become the starting-point of a new monumental art, which will set itself the hitherto unknown task of presenting, with the authority of great sculpture, moods and views of the world, viz., the spiritual conditions common to a people, of interpreting them to that people, and of fixing them for history.

With all its novelty, Bartholomé's work is, notwithstanding, not without organic connection with the historical development of art. There is no virgin-birth in art. Every work has a pedigree. Bartholomé's art is allied to the Campo Santo art of the Middle Ages, from which it borrows thoughts of consolation and promise. It nevertheless exhibits a daring progress when it has emancipated itself from the architecture of gateways, outer walls, chapels, etc., and forced its way in independent form, complete in itself.

The street of tombs opens at the main entrance of Père Lachaise, and leads to a gently rising hill, the declivity of which Bartholomé's masterpiece occupies. It displays the irregular, decorated side of a two-storied stone building of ancient Egyptian architecture of the simplest lines. A high door opens in the middle of the upper story, into the shadowy depth of which a naked man has entered. Him follows hesitatingly, with her outstretched right hand grasping his shoulder and seeking support, a young woman, the lines of whose profile, from her mouth distorted with fear down to the soles of her feet that detach themselves reluctantly from the ground, express a horror in presence of the unknown.

Towards this Gate of Death move, on the right and left, groups, each of seven persons, whom the artist has striven honestly, yet without real success, to fashion in various shapes. At the first hurried glance, the two processions appear to be variously moved; but on looking more closely into them, we recognise an uniformity which proves a striking poverty of imagination. On the left, hard by the Gate of Fate, a young woman is sitting on a stone-bench without support, with her countenance concealed by her hands. She cannot make up her mind to rise from where she is resting, in order to take the last step. A second woman is visible in a similar irresolute attitude, in weak relief on the wall. Cowering behind the two, kneeling quite low, so that the thighs lie in parallel lines over the legs, a naked man seems to be whispering words of encouragement into the ear of the seated woman. Then follows a woman sunk on her knees as if crushed, who hides her face like the first with a somewhat different movement, and behind her a man standing, but bending down to her, and addressing words of consolation. Last of all, another woman sitting down, whose dishevelled hair is streaming over her countenance, and, behind her, a man standing upright, likewise as a consoler. Thus is repeated on this side the theme of the despairing woman and the calm, comforting man. On the right side the invention is somewhat richer. Close to the door stands an old man—decidedly the most expressive figure in the whole composition—clinging tightly to the door-posts; and with his head and the upper portion of his body bent forward, he tries to get a terrified glance at the awful mystery, ere he pulls himself together for entering. To his group belongs a woman stretched on the ground with her face pressed in her hands before her; another folding her hands in prayer, and a half-grown girl shrugging her lean shoulders in terror. There follows a second group of three figures—a woman with dishevelled hair, bowed low to the ground; a crouching man supporting her and preventing the feeble figure from sinking down completely; and a young woman who kneels on one leg, turns her back to Death's portal, and glances back on life as though she still hoped for deliverance.

The lower story shows, through the front-wall, which is removed to its full extent, the interior of the vault into which the upper Gate of Death seems to lead down. On a mattress-like couch rest, side by side, the naked bodies of a man and his young spouse; across their bodies is laid their little one year old child; in the background is visible in low relief on the wall a winged angel with outstretched arms, who looks down lovingly on the three quiet sleepers. With a _naïvité_ which does not rise above the puerile method of the _quattrocentisti_, of making their figures express themselves by means of legends issuing from their mouths, Bartholomé writes on this wall beneath the angel the sense of his allegory: "They that dwell in the land of the shadow of death, upon them hath the light shined."

Above all, the artist deserves the respect that is due to long and earnest effort. We have here before us a work of ten years' labour, executed with composure, inspiration, and conscientiousness. He who can do that, of him one may say, without the slightest suggestion of irony: "With his talent, however applied, the man is certainly a character." Many details of the monument, nevertheless, prove that Bartholomé is not only a character, but also a man of talent. The husband and wife turn their quiet faces to each other in the rest that is in the grave, and lay their hands one upon the other; and this movement is so tender and sincere that it makes a deep impression. It really expresses in sculpture the love that endures beyond the grave. It is the solitary true emotion in the whole work; for he whose eyes grow moist at the sight of the dead child with the sweet little baby limbs, will say to himself that his emotion is not of an æsthetic nature, is not evoked by the means of art, but is the purely physical reaction of a human heart from a cruelly painful impression, in which no artistic element or inspiration is mingled. The woman who enters Death's portal a prey to horror exhibits graceful lines, and the old greybeard who timidly peers into it is cleverly conceived and accurately represented.

Beside these excellent details, many middling and absolute weak ones disturb us. The dead husband in the grave has an Aztec face of repulsive ugliness, which is not called for by any artistic considerations. The attitudes of many figures, especially those squatting or cowering, are in bad taste. A primary personage—the man who has stepped into the Gate of Death—stalks bending forward with head bowed down and the muscles of his back contracted, like one who is hauling with all his might. It is a matter of surprise that the tow-rope with which the vessel is dragged is not to be seen. I cannot prove it, but I am convinced that Bartholomé has formed this man, not after a model, but from what he recollected of a hauler by Constantin Meunier. I have already called attention to the monotony of the group _motifs_. The whole conception of the composition, at any rate of the upper story, is an echo of Canova's monument to Maria Christina at Vienna, with the further development that Bartholomé shows the subterrestrial and

supernatural continuation of the theme which Canova carries only as far as the entrance to the realm of shades, leaving what follows to the pious belief of the spectator. The weightiest objection which must be made to the work as a whole is its offensive lack of repose. All the individual details are, with few happy exceptions, realistic, whilst the effect of the whole composition moves in extreme unreality. How has Bartholomé's most original artistic instinct not preserved him from trying to present a wholly ideal dogma with the most vulgar, petty realism? Simple mediæval sculptors might work thus. In our contemporaries we do not believe in simplicity, and therefore the discord between idea and form has a jarring effect.

The most ideal dogma that Bartholomé preaches is, however, that of the immortality of the soul and the resurrection of the body; for his monument can mean only that, if it means anything at all. It is conceived as a consolation to the sorrow-laden who form the last escort to a dear one that is dead, or are making a pilgrimage to the grave of one they loved. And what consolation has he to offer them? See, he says, in the figures on the upper story, the sorrow with which men approach the gates of shadow-land. Why this faint-heartedness? Why this timorous shrinking from the terrors of death? Death has no terrors. It is entering into peace and the fulfilment of a high promise. And he shows, in the lower story, the gentle, blessed rest the dead enjoy who there slumber until their resurrection, watched by their guardian angel, who awakes them at the appointed hour, and convey their immortal souls to their divine destination.

That is the cosmic view held by an artist on the threshold of the twentieth century. Holbein and his predecessors in painting the Dance of Death were men who believed in Christianity, but the only consolation that they offered mortals was this: Don't bewail your mortal lot, you share it with Pope and Emperor. The path from the Rationalism of this exhortation to the mysticism of Bartholomé's dogma is called by the decadents Progress.

The decadents are consistent when they call Bartholomé a modern, one of the most modern, and hail his work as the art of the future. It is logically on a line with the "progress" and "modernism" of a Huysmans, Maeterlinck, Bourget, and other New Catholics. But what is to be said about the city of Paris having this unctuous work erected in Père Lachaise? Had the Moscow Duma done it, everybody would have found it natural. But the Paris Municipal Council! This society of boasting freethinkers which has banished the Cross from the schools and churchyards, hounded the Sisters of Mercy from the hospitals, has the dogma of the Resurrection preached officially!

That is the highly interesting ethical side of this work. It reveals monumentally the confusion in the donkey-heads of the self-styled freethinkers. That they should decree the honour of a public site to a composition of a dogmatically religious character is proof of crass ignorance of their own standpoint, or else of their hypocrisy. I prefer to assume it to be their ignorance.

XV

JEAN CARRIÈS

The little palace, the charming edifice which was already attractive as the abode of the Dutuit collection, has received a new value and consecration. A room has been opened in it, in which a great artist reveals himself, whose acquaintance, though not indeed quite exhaustively, but nevertheless very profoundly and familiarly, can be made only here in the wide world. This artist is Jean Carriès, who died in 1894, at the early age of thirty-nine, after a marvellously planned life. To this pattern life, as expressive as any whose story Vasari has told, belonged a patron who kept what is vulgar away from him, who saved him from care and anxiety, who made his mind easy as to his influence on contemporaries and posterity, and, to a certain extent, symbolically personified his fame for him. This useful part was played by a certain Herr Hoentschel, who acquired most of Carriès's works. He has now presented them to the City of Paris, and, by so doing, rendered the opening of the Carriès Museum possible. In return his name has been engraved in letters of gold on the marble slab which declares the purpose to which the room has been assigned, beside that of his trusted artist—no mean satisfaction to a high-aiming ambition.

Carriès was the son of a poor artisan of Lyons. He seemed destined, as he thought, to follow his father's avocation; but the fairies had conferred gifts on the proletarian's child in his cradle: sense of beauty and power of design. He was for a short time apprenticed to an artisan; then he taught himself to be an artist. He pursued no beaten tracks, and could follow no guides. He was left to his own sense of locality for finding out a path, and he made wide _détours_, but, nevertheless, raised himself safely to the highest peaks. Phenomena delighted him as form and colour. His pleasurable sensations sufficed to impel him to utterance in sculpture and painting; he satisfied his delight in form by modelling in clay, his delight in colour by enamelling.

For nearly two decades he sought, strove, and created in solemn loneliness. Only the patron whom he luckily found at the right time glanced over his shoulders when at work with bated breath. His reverential admiration expressed itself in a convincing manner by the helpful gesture of the open hand. Some intimate comrades were allowed to witness the lofty drama of an exquisite development. His studio, however, was far removed from the noise of the market. The heat of praise and the icy breath of blame brought no disturbance into the even climate in which his talent was powerfully developing. Quiet and collected, he worked on until he saw his inner vision realised before him. Then he said: “It is good”; and allowed a great Sabbath to follow the hard days of creation. Absolutely unknown to wider circles, in 1892 he stepped before the public for the first time in the Champs de Mars with a rich exhibition. An hour after the doors of the “Salon” were open, he was famous. In the history of modern art, never before had such an impressive revelation been observed. There was no hesitation, no vacillation. Artists, critics, connoisseurs made pilgrimage, as if guided by the shepherds’ star in the bodeful procession of the three kings of the East to Carriès’ glass cases and pedestals, bent their knees, and brought incense and myrrh. His countrymen shouted for joy: “France has one great painter more.” Thoughtful persons looked at one another and said softly: “The world is by one beauty richer.”

All asked: “Who is the man?” for they insisted, in their amazement, that nobody knew him. And then they found out that Jean Carriès was a finished artist, a man of thirty-seven, who lived in the provinces, and had, up to that time, sought nothing but the satisfaction of himself. He had not wasted the tiniest little spark of his Promethean strength in the vulgar melodrama of fighting for success. His tragedies were the great struggle with the resistance of material, and doubt of himself, and they had been played in secret in his soul. And now was pressed upon him that for which candidates strive convulsively, and how often fruitlessly! The Champs de Mars Society elected him with acclamation to full membership, and dispensed him from the probationary period is associate. The State asked for specimens to serve as models for its museums, and tied the red ribbon to the buttonhole of his blouse. What was purchasable was bought up by the ladies of Arc de Triomphe quarter during the first days of the “Salon.” A rich American lady, Mrs Winnareta Singer, commissioned him to carry out the model of his fantastic “door.” The artists fêted him by a banquet in his honour—a homage which at that time was not lavished as was the case afterwards. Mdlle. Luise Breslau painted his portrait, which is now exhibited in his room in the midst of his works, and showed his admirers a still youngish man of noble beauty, with a Lucius Verus head, the Cæsarean nobility of which was not in the least injured by a careless slouched hat. I do not know whether Mdlle. Breslau has flattered her model or has been honest, for I never saw Carriès himself; but in the picture he appears, as one would like to fancy him, every inch a gentleman, on whom his careless working-dress has the effect of a disguise which does not for a second deceive as to the rank of the wearer. A delicate, slender figure; wonderfully active, inspired hands; deep, searching eyes that seem to sight and fix a dream-picture hovering away; soft, narrow cheeks, on which uneasy shadows play, under the short beard; a thoughtful, white forehead over which an abundance of light brown curls falls. How many women may have indulged in dreams before this likeness, for it fascinates even men!

The homage received had no intoxicating effect on him; the activity of the Press concerning him did not infect him with the smallest beginnings of conceit. He withdrew from the curiosity of the world by quietly returning to his provincial nest, where, day and night, he stoked his flaming furnace, and mixed his acids and metallic salts; suffered under frequent disappointments, and enjoyed rare delights in the success of a firing or a coloured enamel. In the ensuing year one looked in vain for him in the “Salon,” and not quite two years after his unparalleled triumph that came like a bomb, men learnt that he had died.

His life had ended artistically. Carriès disappeared ere his locks grew scanty or grey. Beautifully and noiselessly, like another Euphorion, he soared away from the admiration of his contemporaries in the full lustre of his fame; and his works, through his early death, experienced the enhanced value of the Sibylline books. We may call him happy, for in this room we feel that he had given his best when he died. With a longer life he might have gone astray, for there is no lack of short openings to false paths. Very likely he would have repeated himself many times, and that would have detracted from the dainty charm of rarity which, besides their noble beauty, is peculiar to his works.

He unites in himself two different and equally perfect artists: the sculptor and the art-potter. Each tilled a tiny field; but with what intensity! And what harvests they conjured out of it! As sculptor, curiously enough, the whole human figure in its Olympian nudity failed to interest him. He has not on a single occasion sought to represent the body’s Paradisaic beauty. He confines himself, apparently on principle, to head and hands; but these are surpassed by nothing, and equalled only by little, that all the centuries since the Renaissance have produced. I pass respectfully, yet without deeper feeling, by his busts of Velasquez and Franz Hals. They are merely exercises of his hand, perhaps only pastimes. They seem theatrical by reason of the accentuation of the costume. In their countenances the absence of the model is too evident. But beside them the busts of Gustave Courbet, of Jules Breton, especially of Carriès himself, operate with unequalled authority. They live before us; they think, and they reveal themselves. In

looking at them we involuntarily call to mind the old stories of the earthen statues which a magician filled with the breath of life in order that they might serve him.

The same impression, only intensified and deepened, is felt before the busts of the “Young Girl with the Drooping Head,” the “Dutch Wife,” and the “Dutch Maiden.” This young Dutch girl is particularly adorable. I do not consider I am exaggerating when I say she ranks as a sister, though in a different technique, with the “Mona Lisa.” The maiden’s innocent eyes, which have no presentiment of the passionate secrets of Gioconda; the graceful, reposeful countenance, that seems wondering blissfully over her own blooming youth and the loveliness of the world, charm us like the miracle of a spring day. Similar joy streams from his sleeping and waking little children. The softness of this baby flesh, the delicate texture of this plump, warm, satin skin, are unattainable. Carriès discovered a new technique for the life of the outer skin, the results of which, in his hands, are amazing. He gives a delicate, perpendicular creasing to the membrane of the lips, and marks it off from the skin of the face in a discreet but firm line, so that it imparts the illusion of seeing swelling lip-red framed in mother-of-pearl. The mouths of his women are weirdly seductive. It would really not surprise me if semi-fools and lunatics were to pounce upon these ravishing lips with eager kisses.

Even when Carriès is not idealising, but is reproducing portraits true to nature, he imparts to them an inwardness which seems unfathomable, like that of a deep soul. For this let any one only look at the “Bust of an Unknown Lady” and “Mother Callamand”—the former a cold, proud patrician, perhaps the Clara Vere de Vere, in whom Tennyson admires “that repose which stamps the caste of Vere de Vere”; the latter a splendid old nun, probably an abbess, a sturdy, peasant woman who is conscious of her high rank in the convent, and in whose broad face goodness and severity, healthy power and enthusiastic spirituality, are mingled. This gift of filling the subject with inward life is the strongest element in Carriès’ genius. In a series of works which were exhibited in the Champs de Mars Salon, and are, unfortunately, not to be found in the room of the Little Palace, this cropped up overpoweringly. There were fabulous animals, monsters, which a luxuriant imagination had invented—toads, frogs, lizards of gigantic size, in positions humanly conceived, the female reposing on the breast of the male, whose eyes are closing in rapture, and delicately embraced by his paws. One might think they would have a grotesque effect; by no means. Their anthropomorphism brought them in danger of derision; but the genius of Carriès was here directly revealed. The quasi-human, emotional life manifested in their attitudes made them pathetic. The toads’ legs were not seen; their mouths and goggle eyes were not seen. People saw only the unmistakable trait of love, and were moved by this exhibition of the primitive feeling—the same in man and beast—which holds the world together.

Perhaps it is in accordance with this gift of spiritualisation that Carriès never worked with marble, rarely with bronze, but, as a rule, and preferably, with potter’s clay. Stone and metal, however painfully correctly they render, with every stroke of the thumb and impression of the finger, the clay model, seem to him too hard for the inexpressible tenderness which he wants to express. Only one material satisfies him—the one which possesses the softness of flesh and of nerve-plasm. He can knead only clay so that it retains his lightest vibrations. There is something about his busts of burnt clay that reminds me of phonographic cylinders. There is soul-melody inscribed in them in invisible lines, and, set in our mood, they again begin to give forth sounds, and to repeat the mood of him who composed them.

The ability with trembling fingers to coax emotions into soft clay and to render them plastic seems to be something divine. It did not satisfy Carriès. Anybody else would have found the limits of his genius enviably wide; to him they appeared narrow, and he tried to pass beyond them. He wanted to create monumental pieces of sculpture, and he constructed his “Martyrdom of St Fidelis” and his astounding “Gate.” The “Martyrdom” is a group, composed of the kneeling martyr in monastic habit and the executioner behind him, raising his armed fist to deal the murderous blow. In the details the artist is here, too, distinctly Carriès, _i.e._, the executioner is of superb cruelty—a fine specimen of the family of brutalised legionaries or torturers who, in mediæval _relievi_ of the Way of the Cross, scourge Christ at the pillar and nail Him to the Cross. Taken as a whole, the master’s art is a failure; the group has no line. The drama cannot be seen from any side, that is, the gesture of the executioner, with its menace of death, and the countenance of the martyr who is awaiting his last trial, cannot be comprehended at once in a single glance.

If this group is weak, the “Gate” is a complete failure. He imagined a gateway with a depressed keel-arch top, divided by an intervening pillar into two gates. The pillars are covered with grotesque masks and mythical animals from top to bottom. The arch of the gate is formed by a dragon, in the gaping jaws of which stands a noble lady. The separate masks and monsters scintillate with spirit, fancy, and humour. In richness and variety of invention, and in depth of humour, I unhesitatingly place these heads far above Germain Pilon’s Pont Neuf masks. The contrast, too, between the fearless maiden standing in the animal’s jaws, full of quiet self-confidence, and the hideous beast, is of pregnant symbolism. The work is, nevertheless, an aberration, as a whole. The masks and monsters have no organic connection with the gate, either constructively, or in accordance with the meaning. They are simply

stuck on. And the gateway itself is an insoluble riddle. Where should it lead to? To a lunatic asylum, a museum of caricatures, or a carnival ballroom? Or should it mean “the abstract door,” the door pure and simple, without the purpose of an entrance into a building? The poor, great artist consecrated years of his life to this prodigy, and never saw that he had wasted them.

The decorator amused himself in devising unheard-of enamels. He modelled vessels of smooth, supple plant-forms—calabashes, melons, cucumbers, mamillaria-cactuses, bulging or fallen in, smoothly swelling, or warty and shrivelled, whimsically dinted like a thin copper-plate, wantonly hammered, or lumpy and swollen. And over these whimsicalities, which show an incredible mastery of the material, he poured glazes which look so fat and moist that they seem to flow still, viscous and languid. Many are purple, like half-curdled blood; others white and rich, like fresh cream; and others like coloured fruit juices; but many a time we think we see thick matter and brains in frightful discharges; and on some vases the enamel imitates the lichens which overrun the bark of trees in spots, grooves, and bands. And when Carriès has done enough with these glazes, which remind us of opalescent life-saps, he tries diversity in glazes of gold, silver, coral, and precious stones, which change his stoneware phials into splendid vessels from a treasury of the Thousand and One Nights.

As a sculptor in clay Jean Carriès stands as high as Della Robbia; in details—in forming lips and cheeks—far higher than the latter; and, as a decorator, no one can be compared with him, not even Bernhard de Palissy—to mention a name by which his rank may be estimated. Carriès is not a man of to-day, and fashion lies far below the height on which he works. The wretched æsthetic-babbling coteries of the period cannot get hold of him, or make use of him for the senseless but furiously bellowed catchwords peculiar to the polemics of the day. He is not a modernist, not a classic, not an impressionist; he is not this, he is not that, but, he is, quite simply, himself. He works up what he has learnt in his own person; he invents his own, and always gives himself. He creates from his own soul, without looking to right or left. In him there is no school, no tendency, and no straining, but only feeling, personality, and the service of beauty. Yet it is through these great artistic natures, which belong to no time, that the line of development in art proceeds, and not through the pitiful _homunculi_, whom Faust caricatures artificially engender in advertisement-retorts.

XVI

WORKS OF ART AND ART CRITICISMS

During the last years the relation of public opinion to works of art has been repeatedly discussed, and on each occasion with great warmth.

The discussion, in the main, is concerned with two questions which are independent even if they are connected with each other, viz.: Has the public a right to judge a work of art, or must it renounce its own opinion and simply bow before the verdict of specialists? Have not all, or, at any rate, many, works of art that have subsequently gained undisputed recognition by the world, been strongly opposed and rashly rejected on their first appearance in public?

In 1899 intellectual Berlin was excited about a pertinent question. Professor Franz Stuck, the Munich painter, had obtained a commission for a wall-painting for the German House of Parliament. When the artist sent in his sketch, there came a shriek of most unpleasant astonishment from the judging committee of the Reichstag, and a member, Dr Lieber, expressed in public session, in very strong language, his absolutely unmixed feelings in respect of the work.

The Munich friends of the insulted artist, to their credit, made common cause for him. They published an armour-clad protest, in which they characterised the members as “laymen unable to judge,” and reproached them with impertinence because they “thought they understood everything better than learned specialists did.”

I expressed my views then in the _Deutsche Revue_ of this opposition between specialists and laymen in plastic art, and I ask permission to repeat here in brief the essential part of my arguments.

Who are the experts? From the general drift of the objection on the part of the Munich artists it was to be concluded that they must be the practising artists, the critics, perhaps also the professors of art-history. Let him who does not belong to these three sacrosanct categories steal weeping away from the confederation of experts. And even among the critics there is probably a selection to be made. The critic who praises the artist is to him undoubtedly an expert; the critic who blames him shows himself incontestably as a _bourgeois_, and in intelligence stands almost as low as a common University professor who does not teach art-history.

All this is foolish talk. In matters of art, if, indeed, any one can, only an individual—never a category—can lay claim to the rank of expert. Is, perhaps, the practising artist the expert? He is not so necessarily. There are people whose vocation in life, or, speaking more correctly, whose usual occupation, is painting, but whose painting is a continuous insult to art. One may be a professional painter, and yet a pitiful dauber, and commit such impudent sins against good taste that every non-expert must recognise this at the first glance, and be provoked at it. Or is the critic the expert? It would be a good joke to assert that.

Nearly every verdict on a work or an artist committed to paper by a professional critic is opposed by another verdict, also by a professional critic which says the exact contrary. Which of the two critics is an expert? Which of the two has a right to demand that people should bow before his verdict, because he habitually makes phrases about works of art in public? What proof of capacity do the papers as a rule demand of the _beaux esprits_ to whom they entrust art criticism? He who has observed dozens of times how ambitious young newspaper-writers, on their first report of an opening of an Exhibition, or after forming a coffee-house acquaintance with an artist thirsting for advertisement, suddenly discover in their minds a gift for art criticism, and have subsequently cultivated this with brazen self-consciousness; he will feel highly amused when people try to crack up art-critics as experts, simply because they exercise this function. Even professors of the history of art, even directors of museums, are not, by reason of their office, experts in the sense of possessing very profound understanding of art. The academic study of art-history lays the chief stress on the facts belonging to the history of life and morals, which need have nothing in common with the understanding of art. One may make in archives the most beautiful discoveries for the biography of Leonardo, and not feel a single one of his pictures. And as regards superintendents of museums, it is possible to relate the funniest anecdotes about their fallibility, and oppose to them simple connoisseurs, also “non-experts,” who have formed splendid private collections.
